from security operatives is one of the most taunting experiences of Nigerians in this critical time. Recently, the media featured a man who was killed by security operatives for violating government order to wear a face mask. In Abia state, an angry community recently set ablaze a police station over the brutal murder of a citizen by a police officer. Such cases are numerous in Nigeria mainstream and social media. The lockdown in Nigeria has also increased home-based violence. On the 6th of May 2020, the Ebonyi State Broadcasting Service featured a 28-year-old man who beat an 11-year-old girl (daughter of a co-tenant) to death for pouring dirty water in front of his apartment. With the sit-at-home directive, the country also fears the imminent but unwanted birth increase in the nearest future. Without doubt, COVID-19 has created a multidimensional conflict in Nigeria.

With a daily rise of confirmed cases of COVID-19 in Nigeria, the public is getting frustrated that the number is not declining which may lead to more lockdown orders. It could be recalled that the president of the federation, Muhammadu Buhari during his press briefing on the 27th of April 2020, extended the lockdown to the 4th of May 2020, issuing a fresh lockdown of the duration of 2 weeks to Kano State in order for special attention to be given to the state. Suffice it to add

that the deaths in Kano State of Nigeria have thrown the country into questions and fear as there are conflicting reports regarding the cause of death. The inconclusive opinion in Nigeria media was that the death was not COVID-19 related. Later, it was reported to be caused by the intake of COVID-19 vaccine. At last, the deaths were concluded to be COVID-19 related. Such information management causes confusion and mistrust, and disposes the media and the government as purveyors of misinformation and ethically irresponsible.

The country's health system is also a crippling one and may have failed to grasp how far the virus had spread; there is a huge lack in medical facilities and testing equipment across the country. Reports have emerged from Kano about number of deaths rising in its hundreds of unknown causes. This is a call on the Nigerian government to maintain public safety, properly manage the economy, and to start up a working social investment platform.

## COVID-19, Government Palliative and Communication in Nigeria

When nations are hit with deadly and disruptive diseases such as COVID-19, the governments of such nations and other institutions (if responsible) usually roll out palliatives to help the citizens hold on to or survive the tides. With the lockdown measures enforced by the federal government of Nigeria, it is ethically imperative in the light of sound governance that palliatives be distributed to ease the strain the lockdown has had on the economy and livelihood of the citizens as well as carter for their health. The government and other institutions have done this through donations to the state governments, federal government, and the Nigeria Center for Disease Control and other social investment programs.

The Presidential Task Force (PTF) on COVID-19, a body comprising of 12 members selected from different sectors from economic to humanitarian down to health, headed by Boss Mustapha, who is the secretary to the government of the federation, was selected by the president to control all issues relating to COVID-19 from conducting daily press conferences and briefings and more to the disbursement of palliatives and are reportedly doing so. Their criteria are that the palliatives are to be disbursed to the most vulnerable Nigerians who have less than 5000 naira in their bank accounts and who recharge their telephone lines with not more than 100 naira. These are the ones the government considers poor. In view of sound governance which caters for the empowerment of citizens, a study of this kind questions this rationale for the distribution of palliative in a country that has no data base; a country where the average person lives on less than one dollar per day. These indices for ascertaining the poor are indeed a statement on the poverty level and the insensitivity of the ruling class in Nigeria.

Of course many Nigerians have come out to fault the standard given by the minister for Humanitarian Affairs, Disaster Management and Social Development, Sadiya Umar Farouk, on how the disbursement of palliative shall follow. Many bodies and individuals have come out to fault the pattern to be followed arguing that many poor Nigerians would be left out of the scheme, pointing out that only about 40 million Nigerians own bank accounts in a country of about 200 million people. The masses argue that the operation lacks adequate transparency as the task force is already reporting that billions of naira have been spent already in the disbursement of palliatives. Perhaps, nothing has angered Nigerians like the communication management of COVID-19 palliatives. The ethical stand for determining poor Nigerians remains questionable. In the heat of Nigerians complaining that they had not received the claimed distributed palliatives amounting to 43 billion naira, the federal government released the video of the fire outbreak at the office of the accountant general where the account of the palliative fund was to emanate from. Till tomorrow, Nigerians continue to question the ethical soundness of the information disseminated about COVID-19 palliatives.

Table 3 below shows some donations by corporate bodies, wealthy individuals, donor agencies, and other countries to help Nigeria contain the spread and intensify efforts to keep the country

**Communication Management of COVID-19 in Nigeria, Table 3** Donations to Nigeria for COVID-19 relief

| Individuals/Agencies/ Bodies/Country | Donations |
|---|---|
| Keystone Bank | N1,000,000,000 |
| Polaris Bank | 400 hospital beds, testing, and treatment equipment |
| First Bank in collaboration with the United Nations | E-learning solutions to at least one million children under the "keep them engaged" / "keep them safe" initiative |
| Guarantee Trust Bank in collaboration with African finance corporation and Mandilas group | 110 bed facilities located in Mobolaji Johnson Arena |
| Sun Trust | N100,000,000 |
| Providus Bank | N100,000,000 |
| Citi Bank | N250,000,000 |
| Atlas mara(Union Bank) in collaboration with 54 gene | $500,000 |
| Tony Elumelu | N1,000,000,000 to Lagos state government, N500,000,0000 to Abuja, N1,000,000,000 to be shared among the 35 other states, N1,000,000,000 to medical centers for equipments, supplies and free telemedical call center facility |
| Aliko Dangote | 1,000,000,000 and 4 ambulances to the NCDC |
| Abdulsamad Rabiu | N1,000,000,000 |
| Herbert Rabiu | N1,000,000,000 |

floating in this period of the COVID-19 pandemic.

It is worthy to note that some state governments not mentioned in the above table have also set up palliatives for their individual states; Governor Sanwo Olu of Lagos State has set up distribution of food items to a selected few and also providing free medical care for expectant mothers and emergency/casualty cases. Governor Nyesom Wike of Rivers State also provided food items as palliative to Obi-Akpo LGA to mention a few. Many other states have followed suit.

## COVID-19, Media and Ethics in Nigeria

The media is an essential part of any society and plays a major role in the running of the society (Ndolo 2011). In the world's present condition, the media is indispensable as a source of guidance, making its role pivotal in a COVID-19-stricken world. In managing every form of information that is COVID-19 related, therefore the place of ethics in reporting so as to avoid misinformation or tension cannot be relegated.

At the point of this pandemic, the traditional media is charged not only to inform but to educate the populace on the necessities concerning the pandemic. There is so much anxiety, confusion ranging in a cross section of the public (Idayat 2020). The media is charged to ease all of these by providing the people with vital information they

need to stay abreast with the situation. It is therefore ethical to gatekeep news stories so the people do not get misinformed. It is incumbent upon editors to select what kind of information goes to the public and what kind of information gets barred from the public. One of the determinants of news is prominence (Okunna 1998; Bittner 1989; McQuails 2006). Stories coming out from prominent individuals command a great level of legitimacy. In many situations, some persons depend on opinion molders to get and understand information. This is the two-step theory of communication. Some prominent individuals who have spoken about COVID-19 have also misinformed the public. This is not because they wish to do so, but they having no background in public health are not the right sources to get news from, regarding COVID-19. In journalism ethics, one who is not an authority in an area should not speak as though he is one. This explains the essence of attribution in news reporting (Nwodu 2006). The media as an institution should be able to keep the sanity of the populace in check and so mount checkpoints to curb the excesses of opinions coming from prominent individuals. These are such opinions that do not compliment the global best practices on COVID-19 as outlined by the World Health Organization and the public health agencies of their individual states. There should be a deliberate selection of what can be classified as news regarding COVID-19 issues.

It is imperative that journalists around the world choose their source carefully in reporting on all things about COVID-19, even if the source is from a scientist, the journalist must cross-check if the scientist has a deep expertise on COVID-19-relevant topics. Journalists must understand that sources of COVID-19 must be relevant in order for them to be featured; experts such as epidemiologists, public and global health professionals, researchers, practicing doctors, policy makers, and economists should be given the preference in providing news worthy information regarding COVID-19. This maintenance of global best practices is in line with sound governance (Farazmand 2017; Ekwunife et al. 2020a).

The media has a vital role to play in regularly sensitizing the public on measures to be taken out to ease the spread and protect themselves from contacting the virus; if the traditional media fails to do so, the public is exposed to the avalanche of misleading information elsewhere and may as well act on them. It is ethical that the media reports stories in such a way that upholds human interest and in a way that exercises due sensitivity to individual sensibilities and prevailing cultural norms, avoiding social class stereotypes. The journalist has the responsibility to protect all (Udeze 2012). The journalist should ensure that news stories are simplified and the technical words in reporting COVID-19 properly broken down so that all who consume the news may understand. When these technical jargons are overlooked in reporting, it leads to semantic noise in the communication process (Okunna and Omenugha 2012).

Perhaps, one of the most challenging issues in the communication management of COVID-19 is the influx of unedited information on social media. Sometimes, this leads to what Agba (2002) calls "information overload" which brings the audience to a labyrinth. Writing on "Bureaucracy and Citizen Journalism," Ekwunife et al. (2020b) argue that the absence of bureaucracy, checkpoints, and gatekeeping in social media dispose a lot of their content as fake news. If the influx of COVID-19-related information on social media were subjected to ethical test by professional editors, many of them would be "killed at the gate." This is the idea of "gatekeeping" in professional journalism.

The journalist is also charged to stay safe, adhering to protective measures so they can achieve legitimacy in their service to the public. It is ethical in media campaign that the consumers of information see the disseminator adhere to advocacy. This is particularly necessary as Nigerians and the media frowned at and criticized seriously the attitude of the government during the burial of President Muhamadu Buhari's Chief of Staff – Abba Kyari who died of COVID-19. While televised, the burial undertakers were too free with the corpse. Some attendees were not wearing protective gadgets. An attendee who was not wearing hand gloves and face mask beside the grave at the burial even exchanged an item with one of the burial undertakers that lowered the

body into the grave, thereafter used same hand to wipe his face. This holds a lot for ethics and the communication management of COVID-19. The failure of the government to adhere to safety rules at this burial is unethical to government campaigns, and questions the truth about the warnings and message of COVID-19. In the heat of all these warnings on social distancing to contain the spread of COVID-19, the Channels Television featured the funeral of a dignity in Kaduna State of Nigeria with thousands of persons in attendance. The manner in which these crowded thousands clustered, thronged, and carried the corpse wrapped in a white cloth was a statement on the social distancing campaign by the government. The viewer is certainly taken aback that the ruling class that preaches social distancing does not observe it. This shows the absence of ethics in the communication management of COVID-19. Ethically, communication managers should show example of adherence to media campaign.

## Conclusion

With the great impact news information has today in relation to COVID-19, it is ethically imperative that news stories pass through the process of gatekeeping (bureaucracy) so that the facts can be separated from speculations at checkpoints. The public at this time would need updates on the latest happenings and so the media is charged to always give out information from authorized sources only. While the corona virus pandemic is ravaging the world at present, the World Health Organization has already acknowledged the "infodemic" caused by conspiracy theorists and sham conclusions that hold no truth. In view of ethics therefore, only truth should be fed to the public as the extent to which fake news can destroy lives is not to be underestimated. It is ethical that information be checked and cross-checked to verify their authenticity before being publicized. In relation to ethics in reporting, below are 12 messages for COVID-19-responsible communication by the Global Alliance for Public Relations and Communication Management (2020):

1. Before you communicate, think about the impact of your message beyond your organization.
2. Do not hide the impact of the pandemic. Be realistic in your communications, based on facts.
3. Use straightforward, plain language to minimize dramatizing the situation.
4. Include hope in the spirit of the communications.
5. Spread good examples and practices.
6. Identify and legitimize people's emotions.
7. Give priority to messaging from official sources.
8. Avoid sharing fake news. Be critical of sources of information.
9. Do not saturate networks with messages.
10. Do not spend time criticizing public communication. Try to cooperate with them to improve.
11. Support the work of the media providing accurate information in the right moment.
12. Good humor is an antidote to crisis, as long as it is not frivolous.

## Communication Within the Nonprofit

Jochen Hoffmann
Department of Culture and Global Studies, Aalborg University, Aalborg, Denmark

### Synonyms

Civil society communication; Nongovernmental communication; Nonprofit communication

### Definition

Communication within the nonprofit builds organizational identities; it constitutes meanings related to a social cause that reflects the roots of the nonprofit organization (NPO) in civil society, while at the same time mirroring political and economic expectations. Thus, internal nonprofit communication is multi-referential. It constitutes and responds to the tensions that can evolve from a diversity of organizational roles.

## Introduction

Internal communication builds organizational identities, and identity issues are particularly complex in the case of nonprofit organizations. The term nonprofit organization tells us only what these organizations are not: they are not profit oriented – any profits need to be reinvested; surplus revenue is not distributed to shareholders. Another term that overlaps with – and is sometimes even used interchangeably with NPO – is nongovernmental organization (NGO). This term carries the same terminological problem. Again, the title tells us only what such an organization does not want to be. It aims to be independent from the state and, more specifically, from state funding. Overall, it can be argued that NPOs and NGOs need to develop distinct identities by drawing a line between themselves on the one side, and the business sector and the state, respectively, on the other. They constitute the so-called third sector; their mission or purpose is related to a "social cause" – such as charitable activities, development, education, sports, art, human rights, and the fight against poverty.

Overall, there is a huge diversity within the nonprofit sector, which makes it even more difficult to account for internal communication structures and processes in a more generalized way. The following section first outlines the two opposing theoretical paradigms guiding the analysis of nonprofit communication: a managerial and a constitutive perspective. The latter will be used to constitute an ideal type of nonprofit communication, which is neither state-like nor business-like. Diverging tendencies toward a politicization and commercialization of nonprofits are then described. They translate into distinct organizational role tensions, which are both created and managed through communication processes.

## Two Theoretical Paradigms

There is a great deal of theory building and empirical research aimed at analyzing complex and diverse nonprofit communication. These studies can be allocated to two paradigms – a functionalist or managerial perspective, on the one hand, versus a constitutive or communicative perspective on the other (Koschmann et al. 2015). Managerialism separates organizational realities from the communication about those realities. Research in this field conceives of communication as the transportation of information; it aims to find out how information can be circulated in the most effective way – e.g., between managers, volunteers, and external stakeholders. This kind of instrumental perspective treats communication as a tool that comes after action.

The constitutive paradigm focuses instead on communication as an often contested and conflictual construction of meaning. Following the linguistic turn in social theory, it is argued that communication itself is what constitutes organizations and their identities. For example, the question of whether an organization is a nonprofit or which kind of membership roles exists is more than merely a legal question. Instead, these issues are decided first and foremost by successful communicative labeling. Accordingly, empirical research on nonprofits needs to establish which communicative strategies members use to define their organization as a nonprofit, what meanings are related to this understanding, how they position themselves within that context, and how these meanings are negotiated, challenged, accepted, or rejected.

In consequence, *internal* nonprofit communication cannot be understood without analyzing the way the organization is positioned *externally* and in relation to the economic and political systems. Dealing with these tensions and contradictions is the core challenge facing nonprofit communication as a "third space" in society. Getting too close to or even assuming the instrumental logic of political communication or business communication might result in a loss of identity and value orientation (Frumkin and Andrew-Clark 2000).

## References for Nonprofit Communication: Social Capital and Civil Society

Theories on social capital and civil society allow in varying degrees the identities of nonprofits to

be conceptualized as an ideal type beyond the state and beyond the market. Unlike political organizations, nonprofits do not communicate through the code of power since they do not produce decisions that are generally binding on society. Nor do nonprofits communicate through the code of money in the way for-profit organizations do; their function is not to produce and distribute products and services in order to maximize profits.

Instead, it has been argued that they accumulate "social capital," a concept developed both by functionalist and critical scholars. The functionalist perspective was coined by Robert Putnam (1995), who follows an instrumental understanding of social capital, arguing that social networks, norms, and trust are a basis for effective goal achievement. NPOs are seen as an organized form of social capital. Membership ratios are perceived to be indicators of the strength of social capital in a society. Communication is used to build internal and external networks, making the organization more effective as a whole. The critical perspective on social capital, developed by Pierre Bourdieu (2011/1986), instead interprets social capital as a power resource of societal elites. Social capital is represented in highly exclusive personal networks. Nonprofits either are part of or are on the periphery of these networks. In consequence, the internal communication of a well-established NPO such as the World Wildlife Fund would be seen to be fundamentally different from that of a small grassroots organization with a rather loose structure and somewhat anarchic internal communication processes.

Be it in the tradition of Putnam or Bourdieu, social capital approaches postulate a resource-based view on organizational communication. Other perspectives instead claim that civil society organizations need to build their identities from the grassroots, away from the instrumental understanding of social capital as a resource which is used or abused by social players. Accordingly, civil society is conceptualized as the organization of nonstrategic lifeworld communication. The lifeworld is the space within which ordinary people engage in everyday practices in order to solve everyday problems (Habermas 1996/1992). The code of their discursive communication is neither power nor money, but an unquestioned solidarity reflecting the prevalence of a value rationality. It is not the distribution of resources that determines decision-making within a civil society organization but the quality of arguments which are exchanged on equal ground. Nonprofit organizations institutionalize this kind of egalitarian, diverse, and open discourse on social problems, which can then be transformed into issues for the political and/or economic system. Thus, civil society mediates between the needs and demands of our everyday life and system imperatives that impact on these lifeworlds. The next section discusses the potential impact of political and economic imperatives on internal nonprofit communication.

## The Politicization and Commercialization of Nonprofit Communication

The social cause that forms the grassroots identity of the NPO refers to people's lifeworlds. However, engaging in that social cause also implies an engagement with the political system and the economic system. Thus, the initially discursive communication within the NPO might change its character by mirroring the communication of external target groups. Of course, every organization needs to tackle issues of micropolitics and budgeting if they are serious about fulfilling their mission. As such, the politicization and commercialization of communication structures is, to some degree, inevitable. However, this creates an ongoing tension with the civil society identity of the organization (Cohen and Arato 1992). Therefore, nonprofits also need to manage the tensions that arise from the concurrence of political, economic, and value-oriented codes of communication within the organization.

Accordingly, the character of nonprofit communication changes when an organization is in a very close relationship with either the political or the economic system. Such relationship might be an opposing one, for example, in cases in which activist and advocacy groups challenge political

institutions. However, in order to make their voice heard, these NPOs need to know how to play political power games within the public sphere. Their internal structures need to be "lean and mean," with internal diversity and multivocality replaced with strategic and integrated communications. Organizational members are committed to a streamlined one-voice strategy when aiming to influence politics and public opinion.

However, it is not only activist groups that inevitably streamline and politicize their internal communication. This can also result when NPOs partner with government institutions, for example, when implementing public programs on their behalf (Eisenberg and Eschenfelder 2009). The effects on internal communication could be increased bureaucracy and more hierarchy. Efficiency and accountability matter more than volunteerism and emotional labor; expert jargon and political bargaining may replace lifeworld communication and participation.

Finally, nonprofits not only partner with state organizations but also collaborate with private corporations. So-called business partnerships are established in fields such as fund-raising, sponsoring, corporate social responsibility, and certification activities. Again, there can be a mirroring effect on the level of internal communication. NPOs that depend on private money need to learn the language of business and, as a result, may become more business-like: organizational members are seen as customers attracted by individual perks; unpaid work is increasingly replaced by paid work; "online shops" offer more or less mission-related products and services; "new public management" and "social marketing" tools are implemented; and fund-raising numbers become the key success criterion for the commercialized nonprofit organization. The logic of money as the code of communication gradually eclipses the value orientation and the social cause (Weisbrod 1998).

The constitutive perspective on nonprofit communication is able to uncover these processes, because it treats power, money, and normative values not as organizational resources but as distinct codes which might or might not guide the constitution of nonprofit identities. The next section describes role tensions within nonprofit organizations that result from the exposure to different codes of communication.

## Role Tensions as Communication Challenges

The "pure" nonprofit organization, entirely independent from political and commercial pressures while rooted in the lifeworld of its members and clients, does not exist in reality. It is a theoretical ideal type. The same applies to the highly politicized or commercialized NPO. These are "extreme" theoretical references which allow observable nonprofit identities to be positioned empirically within the triangle of civil society, politics, and the economy (Hoffmann 2011). The three corners of the triangle create the tensions to which internal nonprofit communication is exposed. They offer a framework for the analysis of how organizational members deal with these tensions: are they accepted, denied, or resolved? Empirical research shows that paradoxical tensions tend to be denied – you have to play the power game in order to influence politics; you have to be effective in business terms in order to fulfill your mission (Sanders et al. 2015). It is an instrumental rationality which constitutes mean-end relationships in order to reconcile the logics of power and money with a value rationality committed to the "higher end" of the nonprofit organization. However, these kinds of managerial narratives are not always successful in concealing the complex communicative tensions that arise from a diversity of role orientations within the nonprofit organization (Hoffmann 2010). The most important dualisms are:

### Passive and Active Members

Committing to and activating members for organizational goals can be considered a core task of internal nonprofit communication. However, from a functionalist perspective, a large majority of passive members are not per se a problem. If everyone were to join the conversation, the one-voice strategy assumed in respect to external stakeholders would be lost, making the

organization less effective. Moreover, a huge "mass-mediated" nonprofit organization with a largely passive membership base is still perceived to be more powerful than a small organization in which everyone has a say. From an instrumental perspective, the communicative goal would therefore not be to activate as many members as possible but to keep passive members within the organization and to activate only those members with resources that are conducive to the attainment of the organization's goals – members with excellent political connections, for instance, or those who are able to provide access to financial resources. From a normative civil society perspective, however, participation and an open discourse would be an end in itself constituting the grassroots identity of the nonprofit organization.

### Employees and Volunteers

It is of crucial importance to find out how the roles of volunteers and paid staff within an organization relate to each other in terms of communication. Volunteering is a unique feature of the nonprofit sector. It represents the value rationality of civil society: volunteers believe in the organization's mission and therefore want to engage. Instead, the essence of the relationship between employee and employer is an instrumental one of giving and taking: employees work for the organization and receive payment in return. Once more, these are ideal types, and empirical research has identified mixed role understandings following both a value and an instrumental rationality. Some volunteers, for example, might find not only the mission itself attractive but also the specific perks involved, or they may simply volunteer their time for the organization because it looks good on their curriculum vitae. Meanwhile, employees may work even harder if they are also emotionally committed to the organization's social cause. Regardless, the communicative challenge is always to find an appropriate balance between political, financial, and social motives behind involvement with the organization, either as a volunteer or as an employee. Some motives might be highlighted and legitimized through communication, while others are neglected and delegitimized. There is, for example, a difference between communicating engagement for a social cause as a kind of "self-sacrifice" in the spirit of Mother Teresa and framing it as a leisure activity. Not least, balancing a diversity of motives also requires a reflection of organizational power relations. Volunteers often do the field work far away from the headquarters, whereas employees usually run the administration, placing them closer to crucial decision-making processes.

### Leaders and Followers

In consequence, role tensions in internal nonprofit communication may also reveal power imbalances. The distinction between leader and follower roles is more difficult to legitimize in the context of nonprofit communication, since concepts of civil society are linked to an egalitarian understanding of communication, where everybody should have the right to enter the organizational discourse and participate in decision-making. However, at the same time, charismatic leadership, emotional appeals, and the constitution of organizational "heroes" such as the founder are particularly salient in the identity-building processes of value-driven organizations. The personalization of the organization with a focus on one leader, who practically holds a monopoly on representing the organization externally, will result in a limited willingness to share power internally. This so-called founder's syndrome can easily lead to frustration both among board members, executive directors, and in particular among the volunteers who bear the burden of the everyday work. It poses a risk, if the organizational reputation is very much dependent on the individual reputation of one charismatic leader. A personal scandal could even threaten the entire existence of the NPO. Overall, nonprofit communication is particularly exposed to the tensions between an integrating charismatic leadership on the one hand and the multivocality of participatory claims on the other. The impression management skills and media savvy of the leader qualify other sources of power such as political, financial, and knowledge resources. At the very least, this might cause the intrinsic motivation and engagement of volunteers at the bottom of civil society to suffer in the long term.

### Experts and Laymen

The relationship between experts and laymen can also be analyzed from an organizational power perspective. The hands-on experience of volunteers, who, as laymen, delve into the lifeworlds of clients and become familiar with distinct local communities and subcultures, might collide with the abstract expert knowledge of colleagues in the headquarters. The challenge of internal communication is to acknowledge both practical field experience and theoretical expertise as legitimate and fruitful for the organization. Most importantly, communication barriers need to be torn down. Expert jargon entailing a disconnection from laymen communication is likely to foster an unwillingness to acknowledge the value of diverse knowledge sources within the organization.

## Professionalizing Nonprofit Communication?

Passive and active members, employees and volunteers, leaders and followers, and experts and laymen are unique role distinctions constituted through nonprofit communication and determining subsequent communication processes. The ensuing tensions are complex, because they do not result in one overall cleavage. For example, the leaders are not necessarily the most active members (e.g., the meet-and-greet man), the most active members are not necessarily the most powerful (e.g., street workers), and the volunteers are not necessarily laymen (e.g., Doctors Without Borders). Different constellations result in a diversification of social roles within the organization, and emerging tensions are manifested in more or less creative or destructive communication processes. These processes constitute multiple identities of the nonprofit organization, which must reflect its roots in civil society while at the same time responding to exposure to the political and economic codes of communication.

One way of countering these challenges could be the professionalization of nonprofit organizations. Claims to this effect are promoted in particular by business literature, which aims to sell for-profit management tools to the nonprofit sector. However, a sociological and communication approach to professionalism offers a different perspective. Sociologists developed the concept of professionalism as a social force that is independent not only from the state but also from the market. Freidson (2001), for example, described professionalism as the value-driven "third logic" in society. These discourses reveal astonishing parallels to an understanding of civil society as a "third space." In other words, there is not a contradiction, but a high degree of theoretical compatibility between ideals of professional communication and ideals of nonprofit communication. Against this background, the professional is not the one-track specialist who impresses with "total quality management" or "balanced scorecards" but rather the volunteer and layman who is able to take account of complex role tensions in everyday practice. Internal professional nonprofit communication would foster the roots of the organizational identity in civil society, while at the same time establishing a communicative meta-perspective from which the organization can observe and respond to the various system logics to which it is exposed. In other words, professional nonprofit communication constitutes the NPO as a multi-referential and self-reflective organization that explores multiple identities when working toward achieving a social cause.

## Conclusion

Internal nonprofit communication is neither exclusively about internal communication nor is it only about nonprofit communication. The communicative constitution of multiple nonprofit identities cannot be understood without reference to external expectations, in particular from the political and economic systems. These expectations are either balanced against a value rationality rooted in civil society or communication processes contribute to a politicization or commercialization of the NPO. In the latter case, the nonprofit organization would actually no longer be a nonprofit organization and organizational identities would shift in new directions. Establishing how nonprofit communication can build authentic organizational identities when

dealing with a diversity of expectations and role tensions remains an ongoing challenge facing research in this field.

# Community Crisis Management: The Case of Broward County's HIV/AIDS Collaboration Without Hierarchy

Leslie Taylor and James Agbodzakey
Nova Southeastern University, Fort Lauderdale, FL, USA

## Synonyms

Cooperation; Partnership; Teamwork

## Definition

Collaboration refers to coming together of various stakeholders from different spheres with even divergent interests working assiduously to address a complex problem through collectively making decisions and/or implementing decisions and with societal health and well-being as the overarching rationale (Gray 1989). The nature of engagement requires harnessing human and material resources as a conduit to effectively meet various expectations associated with addressing the problem. The complex nature of the problem, as in this case HIV/AIDS, demands collective long-term engagement for sustainable solutions which will enable target populations to consistently receive needed services in consonance with established care and treatment standards. The stakeholders involved in collaboration may or may not derive any direct benefits as commitment to make a difference trumps any real or implied benefits. Collaboration in this context involves three-actor domains in Broward County: service providers, non-elected community

leaders, and the HIV infected and affected, collectively called council members working together to provide needed care and treatment to target populations. Actors hereby connote participants who are part of policy process in either voluntary or mandatory capacity to help produce workable outputs and/or outcomes. And these actors' efforts are greatly enhanced by the grantee and support staff of the deliberative body called the Council. The grantee is the official recipient and administrator of funds geared toward care and treatment of target populations, and support staff is trained personnel who assist council members and grantee on deliberation and related duties. Together, the council members, grantee, and support staff are integral to collaboration. There is no doubt the HIV/AIDS conundrum is a community crisis in Broward County, as it is the case nationally and internationally, and collaborative engagement of multiple stakeholders across sectors appears to be a proactive strategy for creative solutions and management of the crisis.

## Introduction

Broward County ranks second in Florida when it comes to HIV infection with an estimated over 17,000 people living with AIDS (PLWAs) in 2014 even as the state of Florida ranks number 1 in HIV diagnoses in 2013 in the USA (CDC 2015). The rate of infection and the impact on the lives of residents encourage creative approaches to address the problem. One of such creative approaches is collaboration which brings together stakeholders from different spheres: public, private, and nonprofit/civic, segmented into service providers, non-elected community leaders, and the HIV/AIDS infected and affected. The collaborative engagement of these relevant stakeholders across spheres serves as a practical attempt at addressing the HIV/AIDS conundrum at the county since the early 1990s with support from state and federal governments.

The bringing together of these stakeholders to make decisions and to aid attendant implementation for care and treatment is unique and follows federal guidelines with key insights from the Comprehensive AIDS Resources Emergency (CARE) Act, national HIV/AIDS strategy and complementary policies and procedures, bylaws, and other protocols of engagement at the county level. It is worth pointing out that the county engages various stakeholders for preventive efforts and other related health services as part of the holistic approach to addressing the HIV/AIDS problem. However, this entry focuses on collaborative engagement for care and treatment purposes by conceptualizing the stakeholders from the three groups as representing the three-actor domains of HIV/AIDS collaboration in Broward County. The following segments will describe each domain, what it does, and the difference it makes in the fight against HIV/AIDS, particularly in helping provide needed services to infected and affected populations.

## The Three-Actor Domains of HIV/AIDS Collaboration in Broward County

As earlier referenced, the bringing together of stakeholders from public, private, and nonprofit/civic spheres who are segmented into service providers, non-elected community leaders, and the HIV/AIDS infected and affected constitutes a creative way of addressing the problem as a conduit to health and general well-being of the county's population. Though divergent, these stakeholders are resolved to make a difference in stemming the negative health effects of HIV/AIDS, especially on target populations and the domino unwholesome impact on human development, economic growth, and sociocultural engagement of the county among others. This section will highlight each domain and their contribution to the fight against HIV/AIDS in the county. The section is sequenced in the order of service providers, non-elected community leaders, and target populations (HIV/AIDS infected and affected) domains.

### Domain I: Service Providers

Service providers which in this context refer to healthcare service providers are key actors in collaboration aims at addressing the HIV/AIDS conundrum in every eligible metropolitan area

(EMA) in the USA and, as in this case, Broward County of South Florida. Going by the Federal Code of Regulations of 2002, "health care provider means a provider of services (as defined in section 1861(u) of the Act, 42 U.S.C. 1395x (u)), a provider of medical or health services (as defined in section 1861(s) of the Act, 42 U.S.C. 1395x(s)), and any other person or organization who furnishes, bills, or is paid for health care in the normal course of business." The above definition underscores provision of needed services to target populations in order to promote their health and general well-being. These service providers are usually public, private, and nonprofit entities that render categories of services to target populations in the county. Some of the provided services are for outpatient/ambulatory health, AIDS pharmaceutical assistance, mental health, substance abuse, medical case management, health insurance, food bank, outreach, legal, and transportation among others.

The service providers are key members of the various standing committees of the Council; some are members of the Council and others join various ad hoc committees for special tasks as needed. In general, the service providers contribute their expertise borne out of training and years of practice to enrich decisions of the Council, especially for care and treatment. There is no doubt that the successful delivery of services to infected and affected persons in the county over the years is partly due to the essential contributions of these service providers. In fact, the service providers are so visible in the various communities within the county and are mostly the first point of contact for target populations in need of service and for continuum of care. Furthermore, the service providers also serve as chairs and cochairs of committees of the Council.

The service providers as one of the three-actor domains of the Council represent service provision interest aspect of the Council, and this translates into service-conscious contributions as part of setting allocation priorities and other relevant outputs and outcomes. The service providers' level of expertise and experience in collaboration is sometimes unnerving to other members of the Council even if not warranted. Nonetheless, the target populations and non-elected community leaders in addition to grantee administration recognize the importance of service providers to the Council's efforts. Admittedly, the service providers together with other council members positively impact the lives of infected and affected populations of the county.

C

### Domain II: Non-elected Community Leaders

The non-elected community leaders are relevant stakeholders in the community who support the work of the Council as members in order to provide care and treatment to target populations in the county. A non-elected community leader according to Jankowski (1991, pp. 225–226) "is a person who either runs a community organization or is active in local affairs," and "legitimacy in the community is predicated on their ability to provide the residents with services; and because they are more fluid in their social and political relationships than elected politicians. . .." Such is the case of non-elected community leaders in Broward County, especially as it relates to the fight against HIV/AIDS. These leaders are mostly individuals that represent the community and are very visible by virtue of their engagements and/or efforts via nonprofit/civic entities within the county. Their unique position enables them to serve as effective liaisons between the community, county administration, and political actors in order to enhance realizing the public good.

The essential role of the non-elected community leaders is evidenced by their useful contributions to various decisions and/or implementation of those decisions. Like the service providers, the non-elected community leaders serve on various standing committees and ad hoc committees, and some are members of the Council as part of the collaborative efforts. These leaders use their wisdom, knowledge, and expertise to aid decisions of the Council. In fact, some of these leaders chair and/or cochair committees and the Council itself. As leaders, they provide needed facilitative efforts that enable achieving the goals and objectives of the Council through ensuring effective and inclusive deliberations on various subjects and issues and making judicious allocation

priorities for care and treatment services among other outputs of the Council.

These non-elected community leaders have witnessed at first hand the devastating impacts of HIV/AIDS on human lives and the associated regressive socioeconomic effects among others over the years. The observed level of negative impacts of the HIV/AIDS and the commitment to make a difference are impetuses for these leaders participating in collaboration aimed at fostering care and treatment to target populations. Some of these leaders have personal and communal narratives as it relates to the realities of HIV/AIDS and hence their relentless commitment to promote at least remedial, if not curative, efforts through collaborative engagement with other relevant stakeholders such as service providers and infected and affected populations among others in Broward County.

### Domain III: Target Populations

The target populations in this case are the HIV/AIDS infected and affected in the county who constitute critical stakeholders in the fight against the pandemic through their collaborative engagements to enable provision of various categories of services as needed for care and treatment. The coining of the term target populations is reflective of societal categorization of some segments of the population in policy terms. Schneider and Ingram (1993, p, 335) rightly referenced social construction of target populations as "the recognition of the shared characteristics that distinguish a target population as socially meaningful, and the attribution of specific, valence-oriented values, symbols, and images to the characteristics," and they further alluded to stereotypes of groups based on such social constructions as it is the case with people with AIDS (PWAs).

The HIV/AIDS infected were not positively socially constructed initially which somewhat inhibited proactive government response to their plight. However, the passing of the Ryan White Comprehensive AIDS Resources Emergency Act (CARE Act) of 1990 which mandated care and treatment at eligible metropolitan areas (EMAs with at least 2000 PWAs) placed the HIV/AIDS infected and affected at the center of collaboration and as key stakeholders at the Broward County's HIV Health Services Planning Council (Broward County HIVHSPC) alongside service providers and non-elected community leaders. These target populations occupied a unique space in the Council's deliberations and attendant efforts through their participation and representation.

The CARE Act mandates a third of the Council (33%) should consist of target populations. These target populations are critical to every standing committee task and as it is the case with the tasks of the Council itself and ad hoc committees among others. In fact, the institutional design of the Council in line with policies and procedures and bylaws requires, at least, an infected person be present at any meeting before deliberations can commence and votes taking on various subjects of deliberation. For instance, without the presence of at least one infected person at either a committee or general Council meeting, there is no quorum. The meeting has to summarily adjourn even if there is standard quorum because of the presence of service providers and non-elected community leaders.

The recognition of the essential role of target populations in the fight against HIV/AIDS, particularly through their collaborative engagement with other stakeholders to make and/or implement care and treatment decisions including allocation priorities among others, fosters provision of needed services to infected and affected populations. These target populations enhance making effective decisions using their knowledge and experience and passion for general population health to guide their participation and representation. Furthermore, the target populations in various capacities engage in regular community outreach initiatives to educate, empower, and promote participation in various health projects and programs at the county. Thus, target populations together with service providers and non-elected community leaders serve as change agents for health and general well-being of Broward County residents.

Figure 1 depicts the three-actor domains of collaboration consisting of service providers, non-elected community leaders, and target

**Community Crisis Management: The Case of Broward County's HIV/AIDS Collaboration Without Hierarchy, Fig. 1** Depicts the three-actor domains of HIV/AIDS collaboration in Broward County as compiled by the authors with insight from Nakamura and Smallwood (1980)

populations as it relates to the work of the Council for HIV/AIDS care and treatment in Broward County. The figure underscores interconnectedness of representation and participation of the actors at various committees and Council meetings for decisions and/or implementation of decisions that translate into various categories of services for target populations. The Council is at the core of collaboration and coalesce efforts of the various actors for effective performance and in compliance with legislative intents.

## The Council as Avenue for Collaboration

The Broward County's HIV Health Services Planning Council which is referred in this piece as the Council is the main decision-making body for HIV/AIDS care and treatment in the county. Figuratively, the Council represents the hub for multi-stakeholder collaborative efforts as part of the fight against HIV/AIDS. The Council serves as the focal point for service providers, non-elected community leaders, and target populations (collectively called members) to collaborate and make decisions that enable provision of various categories of services to those infected and affected. For instance, for over two decades, members of the Council with the support of the grantees and staff and other affiliates have been able to make judicious allocation priorities to medical and related categories to foster care and treatment to target populations.

The Council's establishment as part of the fight against HIV/AIDS is in consonance with the CARE Act legislative mandate. The CARE Act of 1990 requires the chief elected official in each eligible metropolitan area to either establish or designate a Council consisting of at least three key domains of actors to enable grants from the federal government for various services to target populations. The Broward County opted to establish a Council instead of designating an existing body or local bureaucratic agency to be responsible for decisions and/or implementation of decisions for care and treatment purposes.

The Council uses the CARE Act, Health Resources and Service Administration (HRSA) guidelines, and the national HIV/AIDS strategy with complementary local arrangements as the framework for operation. The framework helps the Council to serve as a suitable avenue for representation and participation for all relevant stakeholders from the public, private, and non-profit/civic spheres to effectively allocate resources for care and treatment. The Council's instrumental role in the collaborative process is enhanced tremendously by the grantee and staff whose supportive role, knowledge of the process, and consistent resourcefulness foster collaboration without hierarchy and thereby make the process truly representative of citizens' participation in governance of peoples' affairs.

## The Difference Collaboration Makes

The Broward County's fight against HIV/AIDS which undoubtedly constitutes a part of national efforts on the epidemic can best be described as collaboration without hierarchy in that the usual command and control which are associated with bureaucratic program management cease to pertain in this case. The county follows advised guidelines from the federal government to establish a Council

with mainly three-actor domains representing stakeholders from public, private, and nonprofit/civic spheres that make decisions and/or help implement decisions which usually translate into care and treatment to target populations across various medical and support service categories. In fact, the representation and participation of various stakeholders even with divergent interests, but bonded by a common resolve to address HIV/AIDS conundrum, enable provision of various categories of services to target populations in the county for over two decades.

The diverse representation and participation at the Council coupled with relentless complementary efforts of grantees and staff enable making thoughtful allocation priorities and attendant outputs such as comprehensive plans and needs assessment reports among others. The efforts of the Council have enabled services to thousands of infected and affected in recent years and have been the case in the past on consistent basis. For instance, within 2000–2006, the Council received approximately $101 million from the federal government for care and treatment purposes which eventually translated into provision of needed services to at least 11,000 target populations annually. Similarly, the Council received approximately $ 64.7 million within 2009–2013 time period with services to at least 13,000 target populations in 2015 alone. The funds include Minority AIDS Initiative (MAI) allocations to augment services to usually underserved and underrepresented affected communities. Even though needs outweigh resources, the Council continues to judiciously allocate resources to provide much needed care and treatment to target populations.

The use of a Council for HIV/AIDS collaboration promotes citizen engagement in the policy process, especially target populations, and enables collective problem-solving. By bringing together main actors from three domains with grantees and staff providing supportive roles, the county administration is able to address various concerns of the various segments of the population with acceptable level of effectiveness. The target populations alongside non-elected community leaders and service providers are able to somewhat promote their sectional interests through representation and participation in the Council while allocating resources to various service needs of infected and affected populations. In fact, the inclusion of target populations in the collaborative arrangement is empowering and gives meaning to the difference they make in achieving the legislative intents for the common good. Undoubtedly, the Broward County's efforts on HIV/AIDS are commendable and worth replicating by other locales as a conduit to promoting population health.

## Community Resettlement

Alessandra Jerolleman
University of New Orleans, New Orleans, LA, USA

### Synonyms

Climate change; Displacement; Emergency management; Extreme risk; Forced migration; Hazard mitigation; Natural hazards; Relocation

### Definition

Community resettlement is the relocation of a community facing extreme risk to another, less vulnerable, location. Unlike historic models of relocation and displacement, community resettlement is a community-led approach that preserves social bonds and increases overall community resilience through the process of a planned and joint relocation.

### Introduction

It is now widely understood that climate change, along with rising sea levels and changing precipitation patterns, will lead to displacement (Sherbinin et al. 2011). In fact, migration as a result of drought, as well as other hazards, has already been observed internationally and even within the United States. Many coastal communities and island nations are now being faced with the need to consider resettlement as an adaptation measure. Unfortunately, governments currently lack the mechanisms and policies to promote successful community-based recovery – and the challenges are particularly acute when an entire nation is facing the need to relocate as is the case with some Pacific islands.

Although climate-related resettlement is already a reality, a more careful and equitable model for community resettlement has not yet been fully developed. One of the challenges to the creation of such a model is the failure to see resettlement as a form of adaptation, as opposed to as a failure of adaptation. In other words, policies focus primarily on allowing communities to remain in place, despite their increasing risks. As a result, the decision to plan for a resettlement is made after the community has been exposed to various stressors for decades and after many of the families with the resources to leave have already done so.

Perry and Lindell (1997) studied community relocation in the United States and argued that permanent relocation is a valuable hazard mitigation measure when the risk of deaths and injuries are high, relocation will save money being spent on repeated losses, and the cost of other mitigation measures is astronomical. They looked for examples of successful relocation but found that overall relocation efforts have not been successful. They proposed a set of key principles for a successful community relocation:

- The community should be well organized.
- All persons and families that might be relocated should be involved in decision-making.
- The multi-organizational context must be understood by all participants.
- Social and personal needs, including financial, must be considered.
- Preserving social networks is critically important.

As these principles illustrate, community resettlement is far more complex than simply moving families from one location to another. To begin with, residents do not wish to leave their communities, and some may have already been force to relocate independently (Burley et al. 2005). Resettlement is a process that stresses the community and strains the existing social networks, even when there is recognition that it is the only viable option (Perry and Lindell 1997).

In order to be successful, a resettlement effort must take into account the livelihoods and culture of the community members, ensuring that their vulnerabilities are not simply exacerbated by the move to a new location. This is particularly true for communities that must move a great distance and whose livelihoods and way of life are intricately tied to the place in which they have historically resided. Indigenous communities, such as the Isle de Jean Charles Band of Biloxi-Chitimacha-Choctaw in the United States, are an example of these types of communities that are closely tied to place.

A successful resettlement must also consider the destination, or receiving community, which may be very culturally different from the community being resettled (Louisiana 2015). Displacement and migration across the globe have historically strained the receiving communities, which may lack the resources to absorb additional population. This is particularly problematic when that population is in need of social services and assistance yet another reason to ensure that livelihoods are strengthened through resettlement.

## Community Resettlement in the United States

The United States has a long history of relocating individuals who are at risk from riverine flooding, often utilizing federal funding to do so through programs such as the Hazard Mitigation Grant Program (HMGP). In many cases, these individual homeowners are able to remain within the community and simply relocate to a physical location that has a lesser degree of risk. In a few cases, however, the United States Army Corps of Engineers and the Federal Emergency Management Agency have moved entire communities out of harm's way. However, these communities were often relocated only slightly inland and were able to retain their previous way of life and livelihoods.

One example of a community relocation is Allenville, Arizona, from which a small community was moved to Hopeville, Arizona, following persistent flooding. The community resettlement required over 3 years to complete and presented many challenges, including maintaining community cohesion, maintaining the commitment to relocating together, ensuring clear communications, and preventing rumors and opposition from surrounding communities (Perry and Lindell 1997).

In addition to planned relocation, there are several cases in which a large disaster event resulted in significant displacement of persons, at times permanent displacement. One example of this is Hurricane Katrina. Although mass internal displacement occurred following the devastation of Hurricane Katrina along the Gulf Coast, resettlement was not seen as a viable strategy at that time, and local governments resisted efforts to provide residents with viable options for relocation. However, many residents of the hardest-hit communities, such as St. Bernard Parish in Louisiana, did choose to relocate. As is often the case, individuals and family groups made the decision to move to another community while making an effort to retain their social and community network. Many families were in fact able to resettle in St. Tammany Parish, a community that is further inland, and to strategically purchase properties in proximity to each other (Lasley 2013).

More recently, community-scale resettlement efforts have involved tribal communities on the forefront of climate change impacted areas (Dalborn et al. 2014; Maldonado et al. 2013). These have included Kivalina Island in the Arctic and the Isle de Jean Charles Band of Biloxi-Chitimacha-Choctaw in Louisiana, both of which are currently navigating the process of a

planned community resettlement. These communities are navigating resettlement; at the same, the federal government must figure out how to create policies that support these efforts.

Several groups have called upon the United States government to craft a policy, or even create an interagency group, that can work with communities facing resettlement. These communities must currently interact with a wide range of federal agencies and policies, some of which can be contradictory. All resettlement efforts that involve federal funding struggle to work within the constraints of the existing federal policies that have not been designed for use in this context.

Historically, the United States did at one time have a Resettlement Agency. The Resettlement Administration was established by president Roosevelt in 1935, through Executive Order 7027 (Namorato 1998), and was funded by the Emergency Relief Act of 1935 in response to the tremendous impacts on farmers that had resulted from the drought. The administration was developed to resettle farmers that were living on land that was no longer arable and also attempted suburban resettlement through the creation of towns. A total of 4400 families were resettled, and three towns were designed and constructed.

However, the Resettlement Administration was absorbed by the Farm Security Administration in 1937 amid widespread criticism over the cost of the resettlement and disagreement over the basic premise of resettlement. There have not been any further attempts at federally supported community resettlement, beyond the few small community relocation projects following flooding that were previously mentioned, since that time. In 2016, however, the State of Louisiana was awarded a grant from the United States Department of Housing and Urban Development to assist with the resettlement of one community, with funding later allocated for a second community, in Alaska, that had competed for the same funding and had not been awarded. As a result, the federal government is now looking at how best to manage resettlement and is convening the Council on Environmental Quality (CEQ) to create policies.

## International Examples

Although there are some examples of communities facing resettlement due to climate change, and vast migration from countries that are facing drought or other increasingly damaging natural hazards, there are no real examples of a successful community resettlement. Instead, there are examples of mass displacement resulting in increased vulnerability.

Historically, the majority of mass-planned resettlements have been a result of large infrastructure or development projects and have primarily impacted indigenous or rural communities. Despite efforts to minimize the negative impacts of these resettlements, none of these can be considered a success. Despite the very different context for community resettlement in the United States, much can be learned from these failed efforts. One of the most important lessons to be learned is the need for full community engagement and for the consideration of livelihoods.

In fact, Michael Cernea, a leading scholar in the field, has argued that communities that are resettled should be given a fraction of the benefits from the development and potential development to avoid having the resettlement lead to their impoverishment (Cernea 2007). Island nations, facing the loss of their entire land mass, will present a unique problem that will require international cooperation to resolve.

## Conclusion

Community resettlement is increasingly being seen as an adaptation, or hazard mitigation measure, of last resort, as communities are faced with increasing environmental risks. As communities make the decision to resettle, or as governments make the decision to create policies around community resettlement, it will be tremendously important to learn from the various efforts that have taken place previously. One of the key lessons to be learned is the need to fully engage the community in planning, throughout the entire process.

Another key consideration will be the timeline for resettlement. A community will not come to the decision that resettlement is necessary until extensive damages have already been experienced, and many members have already moved to another location. In order to be successful at recreating and strengthening the social bonds of the community, and increasing resilience through the resettlement, planning for resettlement must include those community members who have already left the vulnerable site. Additionally, policies and plans for resettlement will have to take into account the size and cohesiveness of the community (Louisiana 2015). Large urban environments will require different approaches than small, close-knit communities.

The current community resettlement efforts underway in the United States, in Alaska and in Louisiana, will serve as test cases for the ways in which existing policy mechanisms can, and cannot, be used in support of resettlement. Learning from these cases, and establishing clear policies, will be critical to the successful use of this strategy in the future. Emergency managers, community planners, and government officials will have to work together to navigate this complex policy environment.

**Social Vulnerability:**

- Unequal exposure to risk to extreme events due to differential socioeconomic and power relations among groups in a given society.

## Introduction

The manner in which disaster is experienced is complex and differs greatly among individuals, households, and communities. This entry presents a literature review of the concepts of social capital, social vulnerability, and community resilience in the context of disaster. These concepts assume that there are benefits by treating the impacted public as a potential partner in response, recovery, and mitigation. Community resilience receives the greatest attention as it has been linked to improved disaster response and recovery through more holistic mitigation and preparedness activities. The impact that specific individual, household, and/or community factors may have on the disaster experience is also examined. To provide a theoretical framework for this examination, multiple models of community resilience are presented, and the impact of social vulnerability and social capital on resilience is considered.

By considering resilience as the result of networked community capacities, Norris et al. (2008) demonstrate that as an individual or household's network expands, social capital increases resulting in increased resilience. The application of a "network systems" model or framework provides further support for the inclusion of the impacted community members in all phases of disaster situations. Within this model, the potential role of social capital on the alleviation of vulnerability and enhancement on resilience is of paramount concern. Finally, this project reviews strategies intended to increase the social capital of vulnerable populations by incorporating community members as individuals, volunteers and within community-based organizations (CBOs) in all phases of the disaster cycle.

## Social Capital

A large body of literature exists regarding social capital. The concept of social capital provides researchers in a variety of disciplines (e.g., public administration, sociology, political science, geography, social work, psychology) an opportunity to consider vulnerability and resilience from different perspectives. Social capital generally refers to a social resource that provides its holder with some level of support and/or power through direct or networked social relationships. As a resource, social capital may be utilized in social transactions and may be considered available for exchange in the same manner as economic capital, physical capital, or human capital.

Briggs (1998, 2004) breaks the concept of social capital into subcategories defined by the type of relationships that connect members of the social network of interest. He defines these subcategories as *bonding and bridging* capital. Bonding social capital represents the connections among people who are alike, connected through family/kin relationships and/or geographical location. Bonding capital plays a key role in daily interactions and is important for "getting by." Bridging social capital represents the connections among people who are unlike or separated by social status, geographical location, and/or resource access. This form of social capital may provide leverage for those in less powerful positions to access key resources to improve their general position in greater society. Woolcock (2004) presents an additional type of social capital, *linking.* Linking social capital is a special form of bridging social capital that emphasizes vertical access to individuals and institutions in positions of political and economic power. Linking social capital will be considered a form of bridging social capital for the remainder of this entry.

Bridging social capital reservoirs differ among individuals, households, and communities. Low economic status, limited property ownership, low educational attainment and low social status negatively impact social capital when power-based reciprocal relationships are considered (Lin 1999; Putnam 2000). However, socially and economically disadvantaged individuals and communities are more likely to have access to higher levels of social capital than other forms of capital such as economic or political capital (Light 2004). This access is typically facilitated through bonding networks. Because social capital is network-based, interactions among individuals and communities that enhance relationships of trust and reciprocity will serve to improve both forms

(bonding and bridging) of social capital. Rupasingha et al. (2006) and Sherrieb et al. (2010) identified indicators of social capital and opportunities for expanding potential social capital capacity. These indicators include social support, social participation, and community bonds. Opportunities for new connections coupled with meaningful, intentional exchanges and maintenance of the linkages over time are essential for the strengthening and expansion of the networks associated with social capital accumulation (Adger 2000; Lin 2001; Norris et al. 2008; Putnam 2000).

## Social Vulnerability

The concept of social vulnerability explains the unequal relationship between the exposure to risk and the social disruption experienced by different individuals, households, and communities. It also explains why some are more likely to suffer greater losses and disruptions at the time of impact and why some take longer or fail to re-establish pre-disaster conditions. Alexander (2000) defines vulnerability as the potential for casualty, destruction, damage, disruption, and other forms of loss in any particular extreme event. Wisner, Blaikie, Cannon, and Davis (2004, p. 11) provide the following working definition of vulnerability: "The characteristics of a person or group and their situation that influence their capacity to anticipate, cope with, resist and recover from the impact of a natural hazard (an extreme natural event or process). It involves a combination of factors that determine the degree to which someone's life, livelihood, property or other assets are put at risk by a discrete and identifiable event (or series or 'cascade' of such events) in nature and in society." In their description of the "Progression of Vulnerability" component of their "Pressure and Release" (PAR) model, vulnerability is increased by limited or restricted access to political power, influential societal structures, and other resources. The PAR model also considers limiting social ideologies such as exclusive caste systems, a variety of negative dynamic forces, and resulting unsafe conditions that also serve to diminish access to key resources. Any condition that restricts access to assistive or supportive resources increases social vulnerability. These same forces and conditions restrict individuals and households from expanding personal networks and social capital reservoirs.

Research has determined that increased vulnerability is due to exposure to the hazard and/or failure to access resistant shelter (Anderson 2008; Cutter and Finch 2008; Zahran et al. 2008), poverty (Alexander et al. 2006; Bankoff 2003; Nigg et al. 2006; Van Willigen 2001; Walsh 2007; Zahran et al. 2008), ethnicity (Anderson 2008; Bolin 1986; Ethridge 2006; Johnson et al. 2002; Nakagawa and Shaw 2004), disability (Mileti 1999; National Council on Disability 2009), and gender (Fordham 1999; Morrow and Enarson 1996; Norris et al. 2005; Rodriguez et al. 2006).

Cutter et al. (2003) explored the intersection between exposure to geographical hazards and social vulnerability/resiliency to create a place-based index of vulnerability (SoVI). While this index has inherent limitations including the relatively large unit of analysis (county) and reliance on census data, the researchers developed a multifaceted index providing a consistent point of comparison between vulnerability statuses based on geographical location. Within this index, socioeconomic status, employment, family structure, social dependence, and civic engagement are included as social aspects of vulnerability. The consideration of civic engagement is a key avenue to expand social networks that may lead to lower levels of social vulnerability. This link may provide a potential strategy to not only reducing vulnerability but also enhancing overall community resilience. This connection will be explored in more detail later in this entry.

### Social Vulnerability and Differential Disaster Experience

The disaster phase of recovery illustrates the effect social vulnerability may have in the disaster context. Drabek (1986) established the most widely utilized concept of the disaster "cycle" (preparedness, response, recovery, and mitigation). Drabek broke recovery into two phases:

*restoration* occurs during the first 6 months post-event, while *reconstruction* is the period following the restoration period. Reconstruction has no chronologically defined termination. Other researchers expand on this definition and define recovery as encompassing all post-response activities intended to return the impacted area and community to a pre-disaster state. Bates and Peacock (1989) view recovery as social reorganization, a post-disaster adaptive process. This adaptation has the potential to have a negative or positive impact on the victims. The process of adaptation is a critical component of resilience to be explored later.

Neal's (1997) discussion of the four-phase disaster calls into question the finite divisions that Drabek's model suggests. Supporting the need to put recovery into a social context, Neal points out that victims experience response and recovery at different rates based on a variety of factors. This *differential* experience does not allow for a temporal or spatial definition of the phase of recovery as individuals, households, and communities may be participating in different activities concurrently. Some recovery activities also encompass tasks that are specified as belonging to other phases. For example, in rebuilding residential structures to meet new building codes (e.g., earthquake or hurricane resistance), mitigation of future hazards is supported. From Neal's work, it is easily understandable how activities associated with response and/or mitigation may also be integral to the recovery process. Cutter et al.'s (2008) DROP model reflects the impact social factors may have on recovery as reflected in differential recovery times for different individuals, households, and communities. Finch et al. (2010) build on Neal's assertions regarding differential recovery. Studying the impact of social vulnerability on the disparate level of social disruption and rate of recovery in different neighborhoods and communities, the research team concluded that the social factors associated with recovery are interconnected, complex, and directly influenced by pre-disaster vulnerability levels.

In light of the differential recovery experiences illustrated by previous research, it is necessary to expand the concept of recovery. Recovery planning should consider the social aspects of community as well as the potential for the reduction of risk and vulnerability for community members. For a community to return to a pre-disaster state, social networks and bonds must be re-established. Bolin (1989) emphasizes that a return to the pre-disaster state may not be possible given the potential level of physical and social disruption created by a disaster. Depending upon the level of disruption wrought by the disaster event, those impacted may include the direct victims of the event and those who experience secondary and/or subsequent disruptions essentially expanding the definition of the impacted community.

## Community Resilience

While vulnerability describes the level of disruption, an extreme event may exert on an individual, household, or community; resilience is the ability of the affected to "bounce back." Mileti (1999) defines resilience to disaster as the ability of a community to withstand an extreme event without suffering devastating losses, damage, diminished productivity, or quality of life without a large amount of assistance from external sources. Tying resilience directly to sustainable individual and household livelihoods, the Department for International Development (1999) considers resilience as a function of available assets that include human, natural, financial, physical, and social capital. This definition operationalizes resilience as the ability of an individual or household to cope with and recover from stresses and shocks and maintain or enhance its capabilities and assets both now and in the future without undermining the natural resource base. Furthermore, this definition focuses on the process of recovery and considers the creation of resilient livelihoods as an output. When resilience is considered in terms of sustainability, the interaction between an individual or household and its overall social network may be conceptually considered as a definitive component of community resilience (Carney 2002).

It is a common mistake to equate a reduction in vulnerability with an equal improvement in

resilience. It is in the consideration of resilience that the complex interaction of social vulnerability, social capital, and resilience become evident. Vulnerability characteristics influence the level of social capital (and the type of social capital) one may access in time of need. Social capital, in turn, positively influences the level of resilience a community may display during an extreme event.

Cutter et al. (2008) examined resilience based on factors associated with location and considers resilience and vulnerability as overlapping concepts rather than oppositional ones. While not focused on social capital, the researchers include two dimensions ("Social" and "Community Competence") that encompass many factors that contribute to social capital. Their "DROP" Model (Appendix A) incorporates pre-disaster conditions within the natural systems, built environment, and social systems. This model helps us conceptualize the interplay of multiple dynamic factors within a community. However, it does not operationalize these factors or identify a point of practical resilience enhancement.

## Resilience and Social Capital

Chen et al.'s (2006) work regarding community involvement in a disaster preparedness program provides further evidence that the power of engaging community members may have on improved resilience by increasing bridging social capital. Chen studied a geographically vulnerable Taiwanese village prone to cyclones and flooding. By involving a traditionally marginalized fishing community in defining its own risk and preparedness priorities, community members adopted a higher level of personal responsibility and communal obligation. As a result, both bonding and bridging social capital was increased through the network of trust forged between the villagers and the government response agencies. In turn, the entire community's resilience improved through both physical mitigation projects and enhanced social capital. This type of community partnership may allow for cultural aspects of the vulnerable community to be respected, honored, and preserved (Gaillard and Le Masson 2007; Newport and Jawahar 1998). In the case of the Taiwanese village that Chen studied, traditional housing design was determined to be more cyclone-resistant than the more "modern" housing the government initially proposed. Traditional housing patterns not only enhanced physical disaster resistance but also supported continued high levels of bonding social capital and demonstrated a commitment to shared local knowledge.

## Resilience, Social Capital, and Adaptive Capacity

Social capital has a potentially profound impact on resilience when considered as one aspect of a community's *adaptive capacity.* A system's (community) ability to absorb the impact of an extreme event is considered its adaptive capacity. This ability to respond, adapt, and/or absorb the negative impact of a disaster is a key component of social vulnerability and resilience (Bankoff 2003; Cutter et al. 2008; Norris et al. 2008). It is through the framework of adaptive capacity that Cutter et al.'s (2008) DROP Model assumes an overlapping relationship between vulnerability and resilience. Many factors that reduce vulnerability also expand resilience but the relationship may not be direct and fully oppositional. However, it is generally accepted that as *adaptive capacity* is expanded, vulnerability is decreased. Adger (2000) asserts that social capital is the key to a community's ability to cope with unforeseen and hazardous events (adaptive capacity). Norris et al. (2008) expand the definition of adaptive capacity to include the ability of an individual, household, or community to absorb social disruptions.

Improved adaptive capacity has also been shown to have a direct, positive effect on community resilience. When confronted with a disaster or other disruptive event, individuals, households, and communities rely on their individual and collective capacities to facilitate recovery. Expansion of one's adaptive capacity may be achieved by accumulating additional physical, social, or financial resources. Adaptive capacity may be expanded through enhancement of sustainable livelihoods, reduced social isolation, strengthened social bonds, the creation of diverse sociopolitical linkages, hazard exposure reduction, infrastructure improvements, and improvement in the

equitable distribution of economic resources (Anderson 2008; Cutter et al. 2008, 2010; Rodriguez et al. 2006; Wisner et al. 2004). All of these activities represent the establishment of greater levels of social capital among individuals and collectives that facilitate access to political, physical, and financial resources.

Smit and Wandel (2006) consider adaptive capacity in relationship relative to stakeholder engagement in disaster planning. They conclude that as stakeholder participation increases, social systems are strengthened and adaptive capacity is expanded resulting in improved community resilience. Ensuring representation of all members within a community in the planning process as full stakeholders results in improving the resilience of more vulnerable populations. This concept of adaptive capacity is compatible with the model of resilience presented by Norris et al. (2008) discussed later.

### Resilience, Social Capital, Adaptive Capacity, and Networks

A community's level of overall resilience appears to be associated with the degree to which its various assets are networked and the degree to which these networks overlap to create a shared experience and perspective. Ganapati (2009) defines the concept of social capital within the network framework as "civic networks as well as norms and social trust that facilitate collective action" (p. 28). Resilience is a function of economic development, information and communication network development, community competence in the disaster context, and overall social capital (Norris and Stevens 2007). When resilience is high, a community can absorb and cope with a variety of potential traumas by utilizing appropriate assets (Wisner et al. 2004). In his discussion regarding recovery, Kirschenbaum (2004) asserts that social ties (bonding and/or bridging social capital) or *networks* provide the greatest potential for recovery. The concept of the social network implies that the linkages within a community are multidimensional and that key individuals may provide "bridges" between networks. Kirschenbaum states that the density and intensity of social linkages between network members as well as toward those in positions of power determine the strength and effectiveness of a network.

Research concerning poor countries and/or traditional societies demonstrate that otherwise marginalized communities may still demonstrate high resilience to natural disasters (Holland and VanArsdale 1986) when a strong social network exists. This is especially true when there is no expectation of external assistance. In these instances, the affected community relies on indigenous coping mechanisms, resources, and social ties to support the recovery of the entire community. Since there is no expectation of assistance from outside the immediate social network, communal assets are the basis of recovery. Gaillard and Le Masson (2007) support these findings in their examination of the social networks within indigenous communities of the Philippines. Rejecting post-disaster relocation efforts imposed by the government, the community initiated its own relocation strategy. By directing its own reorganization, the community demonstrated significant adaptive capacity and resilience.

Family or "kin" bonds are the strongest connections that individuals maintain. However, this type of bond may be extended to friends and neighbors in many developed societies as family members become dispersed physically (Drabek et al. 1975). Work by Klinenberg (2002) and Putnam and Feldstein (2003) emphasizes the dangerous effect that the lack of a strong social network has on individuals and marginalized populations. Beggs et al. (1996) established that the strength of an individual's social network affected the ability to access disaster aid from formal organizations. Survivors of Hurricane Katrina identified their social networks as their greatest source of financial, social, and psychological relief (Forgette et al. 2009). Their findings supported the assertion that family, friends, and place combined for the most powerful social bonds. This research also demonstrated that individuals with the largest social networks exhibited the greatest resilience. Hutchinson and Vidal (2004) explore this phenomenon as they examined the challenge of reducing vulnerability

(economic, physical, and cultural) within marginalized communities within the USA.

### Networks, Social Capital, and Access to Power Systems in the Disaster Context

Berke and Campanella (2006) introduce resilience as the measurement of successful recovery efforts. They establish the importance of including the poor and most socially vulnerable in recovery and mitigation decision-making as important in improving resilience. Emphasizing the importance of pre-existing social networks, Berke and Campanella suggest that repairing these networks following disaster-caused disruption cannot be separated from resilience. Because of the tendency of state and federal recovery efforts in the USA to discount citizen involvement in the recovery process, governmental recovery projects tend to create barriers to resilience. Governmental response and recovery agencies are typically hierarchal and bureaucratic. Within this organizational structure, incorporation of local and nongovernmental organizations is problematic. Unfamiliar with the "system" or established processes, local voices present perspectives and propose solutions not pre-established and within the comfort zone of the lead agency. As a result, local knowledge and preferences are discounted in exchange for the maintenance of agency expedience (Weick and Sutcliffe 2001).

Norris et al. (2008) tie the concepts of social capital, adaptive capacity, and networks together to operationalize overall community resilience in their model (Appendix B.) Norris presents "social capital" as one of the key adaptive capacities available to a community and fundamental to its overall level of resilience. The authors break down social capital as encompassing the following components: (1) received social support, (2) perceived social support, (3) social embeddedness, (4) organizational linkages and cooperation, (5) citizen participation leadership and roles, (6) sense of community, and (7) attachment to place. When considered jointly, the components indicate that social capital represents the entire social matrix in which an individual, household, or neighborhood functions.

## Social Capital and Increased Disaster Resilience

This model of resilience illustrates the relationship between social vulnerability and resilience as it incorporates vulnerability factors into the social capital component. Therefore, social vulnerability, social capital, and resilience are inherently linked in the context of disasters. Using this model, it is demonstrated that activities that increase social capital will improve overall resilience. It may also explain how increased social capital may reduce vulnerability by providing socially disadvantaged individuals and communities' access to political and social power brokers. Norris et al. emphasize that adaptive capacities are dynamic and can be applied to an individual, organization, or larger community. This model also considers the overall resilience of the community specifically in a disaster setting. Using this model as a template, a variety of strategies may be considered and employed to enhance one or more of the contributing factors of social capital and subsequently assumed enhanced overall community resilience. Intentional inclusion of the most vulnerable (and most likely the most impacted) community members in recovery, mitigation, and preparation phases is an important first step. Providing support services to facilitate inclusive participation (e.g., childcare, transportation, scheduling meetings outside of typical work day hours) will increase the likelihood of sustained involvement and representation of vulnerable households. Inclusion of community members in these activities will increase the "social capital" capacity component of the Norris model and should result in improved resilience.

### Therapeutic or Altruistic Community

One goal of increasing the resilience of marginalized communities is improving levels of social, political, physical, and economic assets. The disaster context may provide an opportunity for intentional social capital enhancement. Research suggests that the period immediately following impact may provide a window for increasing long-term community resilience through intentionally community-based recovery, mitigation,

and preparedness activities. Fritz and Mathewson (1957a) described this period as the establishment of the "therapeutic community." Barton built on the concept of the therapeutic community when he created his model of the "altruistic community" in his work (Barton 1969). This phase of social solidarity, high levels of altruism, helping behavior, and social supports becomes the social context for response and initial recovery (Dynes 1970; Golec 1983; Rubin 1985).

These early researchers state that emergency conditions invoke a strong human desire to alleviate the discomfort and suffering of disaster victims (Fritz and Marks 1954; Fritz and Mathewson 1957a, b; Barton 1969). Barton also points out that the victims themselves exhibit strong volunteer behaviors toward other victims when their own suffering is not overwhelmingly severe (such as loss of family member or severe injury.) In his discussion regarding the reasons why community members are key first responders, Dynes (2003) points out that this response reinforces the social ties, obligations, expectations, and communication networks which provide the social stability (social capital) in the affected community.

This type of solidarity may extend beyond pre-impact networks. While studying the victim response following the London subway bombings, Drury et al. (2009) demonstrate the strength of the immediate bonding that may occur after a disaster. In this example, a crowd with no or very limited social connection immediately identified with each other and responded collectively in a positive and helpful manner.

In most cases, victim volunteer activity tends to follow associational pattern (kin, friendship, and neighborhood) immediately following disaster impact. This form of bonding social capital facilitates immediate response activities. Individuals with strong bonding capital report positive feelings regarding the ability to recover and a strong sense of self-efficacy. Gordon (2004) encourages response and recovery agencies to work quickly to strengthen these bonds through open communication regarding the recovery process and preserve the "social fabric" of the affected communities. Gordon's work emphasizes the need to honor cultural differences among the victims and allow different groups to construct their own disaster-related priorities. It is critical that bonded communities are not separated and that place-based attachments are respected during recovery.

There are some exceptions to the therapeutic community response. Heeren (1999) asserts that the majority of victims will assume that other victims experienced similar emotions and impact as they did. Due to this perception, the victims create heightened bonds to each other. This tight bonding results in high levels of social and practical support among the victims. Unlike Drabek (1986) and Fritz and Mathewson (1957b), Heeren's research also suggests that victims may create boundaries between themselves and others who did not experience the disaster directly. Picou et al. (2004) suggest that differential disaster impact and recovery can create a "corrosive" community. This corrosive community may negate any potential vulnerability reduction the initial social solidarity might provide.

Barton's (1969) foundational model of the altruistic community included concern regarding the differential interpretation of disaster impact on victims. If the victims are considered separate or significantly different from the supporting community, the therapeutic/altruistic community may not develop or be exceptionally short-lived. In order for the altruistic community to develop and be maintained, less impacted community members must have direct contact with the victims or the victims must have meaningful visibility. Failure to create either situation often results in blaming the victims or reducing the perceived connection to the victims and subverting the altruistic/therapeutic community. Ursano et al. (2008) state that differential recovery experiences, differential support, or poor communication promotes a rapid transition from the therapeutic environment to communal disillusionment, mistrust, and anger.

Despite the possibility of corrosive community development, the majority of researchers (Bolin 1989; Ethridge 2006; Ganapati 2009; Rodriguez et al. 2006) view the therapeutic community period as an opportunity to address vulnerability by taking advantage of the heightened sense of solidarity. Olson and Gawronski (2003) identified

the solidarity and volunteer response among Mexico City residents after the 1985 earthquake as a catalyst for political reform. In a less dramatic manner, the therapeutic community supports and facilitates new linkages between systems, allows new organizations to emerge, and provides a supportive environment for the establishment of new networks (Drabek 1986; Quarantelli 1989, 1992, 1993). In their review of collective behavior, Weller and Quarantelli (1973) identify the altruistic actions of the therapeutic community as meeting their criteria for emergent norms and emergent social relationships. They also note that the institutionalized behavior of preexisting organizations is oppositional to emergent community-based organizations (CBOs) that arise following disaster impact. Dynes (1970) found that the more rigid institutionalized structures existing prior to disaster are not supportive to CBO formation. He concludes that disaster causes the impacted community to become "disorganized" allowing the formation of emergent organizations and new operating structures.

### Grassroots Citizen and Community-Based Organization (CBOs) Participation

The emergence of grassroots citizen groups and expanded CBOs following disaster is well documented. A grassroots citizen group is truly emergent and did not exist prior to the disaster. These groups tend to form to meet a real or perceived unmet need. Community-based organizations (CBOs) may have existed prior to the disaster but often accept advocacy roles or disaster-related functions that they did not hold before the event. Much of this research has been conducted outside of the USA including India (Newport and Jawahar 1998; Rodriguez et al. 2006), Japan (Mimaki et al. 2009; Nakagawa and Shaw 2004), Taiwan (Chen et al. 2006), Turkey (Ganapati 2009; Karanci and Aksit 2000), Indonesia (Holland and VanArsdale 1986), Mexico (Olson and Gawronski 2003), and China (Shieh and Deng 2011). Research within the USA includes the 9-11 World Trade Center attack (Gotham and Greenberg 2008), California wildfires (Goldstein 2007), Hurricane Katrina (Ethridge 2006; Luft 2009; Nigg et al. 2006) and technological disasters resulting in flooding (Blocker et al. 1991), contaminated drinking water (Cable and Degutis 1991), and the Exxon Valdez oil spill (Picou et al. 2004).

As the emergency period transitions into response and recovery, involvement of the affected individuals tends to be facilitated by grassroots and/or CBOs. These post-disaster emergent or expanded CBOs provide a vehicle for increasing social capital (Wedel and Baker 1998). In addition to preserving in-group bonds, volunteering provides an opportunity for community members to forge bridging links between a "disinvested" or disadvantaged community with the mainstreamed society (Vidal 2004). In her study of the effect of community mentorship through voluntary involvement, Gress (2004) demonstrated the positive effect volunteering has on a community's bridging social capital. The role of membership in volunteer organizations has been shown to enhance the number and strength of bridging social networks (Michel 2007). This expanded bridging network also increases an individual's sense of personal responsibility to the greater community.

For overall community resilience to be expanded, CBOs must be involved in the recovery planning process. The community must also be included in mitigation decision-making to preserve communal bonds while reducing exposure to hazard or threat. Because communal bonds are often place-based, this involvement should include rebuilding and economic development decision-making. To avoid the overemphasis of perspectives of those with high levels of pre-disaster social capital, care should be taken to include CBOs comprised of the most vulnerable impacted community members.

Following the terrorist attacks on 9/11/2001, volunteers reported that their efforts assisted in transforming their self-assessment as victims to empowered community members (Lowe and Fothergill 2004). Post-disaster evaluation in Indonesia following the Indian Ocean tsunami indicated that involving local volunteers provided many benefits to both the local community and the effectiveness of disaster relief (Leitmann 2007). As discussed previously, Chen's et al.

(2006) research demonstrated that inclusion of interested community members in the planning phase is essential for effective identification of disaster risks, mitigation, and response strategies. He also postulates that such inclusion will strengthen connections within the community (bonding social capital) and between the support agencies and community members (bridging social capital), reducing the vulnerability of the most vulnerable community members.

Local management of the recovery process improves effectiveness and results in increased long-term resilience through increased bridging networks and the empowerment of previously marginalized groups (Coughlan 2004). These benefits included the recognition that local capacities may meet immediate lifesaving needs so that external resources could be reserved for long-term needs. His findings also support Chen's et al. (2006) conclusion that the incorporation of community members into disaster preparedness, mitigation activities, and planning process prior to a disaster has also been shown to be beneficial in increasing a community's resilience. Lunn (1990) found that the creation of a layperson's training program for disaster mitigation and response training in Tasmania increased funding for mitigation projects immediately.

Following the Tangshan earthquake, Mitchell (2008) found that the inclusion of local people in the planning process for both economic and physical recovery and development resulted in increased consideration for the more vulnerable members of the impacted community. It also resulted in an improved sense of satisfaction of the overall recovery process. Local involvement also facilitated the incorporation and acceptance of mitigative projects as part of the recovery plan and further improved community resilience to future disasters.

Disasters and extreme events may offer an opportunity for the creation of social capital and immediate adaptive capacity expansion. In his study of emergent neighborhood groups following the Golcuk, Turkey earthquake, Ganapati (2009) concluded that local leaders would often strengthen bonding capital and leverage it into new bridging capital. Through the process of community organizing, Turkish neighborhood groups began to create networks and mobilize international and domestic aid groups in support of the community's recovery efforts. In a similar manner, the inclusion of a vulnerable fishing community in disaster recovery and mitigation processes following multiple cyclones resulted in effective changes in construction techniques and community adoption of preparedness measurements (Newport and Jawahar 1998).

Pais and Elliott (2008) point out the negative impact that CBOs may have on the recovery process if they do not include members of the vulnerable community. CBOs tend to be composed of the more elite, wealthy, and powerful members of an affected community. Poor people volunteer less and join fewer voluntary organizations than those with higher socioeconomic status (Banfield 1968). As a result, those with less social capital are often underrepresented despite their higher levels of disaster-induced social disruption. Lack of involvement of the more socially vulnerable may result in increased social stratification and changes in the ethnic and economic population patterns within the area. Putnam (2000) asserts that communities with high levels of civic participation that may be measured by voluntary organization participation have higher levels of social capital. Civic participation is one aspect of the "social capital" adaptive capacity within Norris et al.'s model of community resilience (Norris et al. 2008). Rohe (2004) agrees that civic engagement is one indicator of social capital but only if it is accompanied by strong social networks, high levels of interpersonal trust, and effective collective action.

## Inclusion and Social Capital

If volunteering and participation in voluntary is an indicator of social capital, the poor are at a distinct disadvantage. Because existing membership in a voluntary organization is associated with higher levels of volunteering, special effort should be made to increase the numbers of more marginalized community group members in volunteer organizations (Michel 2007). Response and

recovery agencies may want to purposively recruit members of more vulnerable groups for leadership opportunities. Krajeski and Peterson (1999) state recruitment and development of traditionally unprepared community members for leadership positions requires more time and effort than including preexisting community leadership in disaster planning processes. However, because of the increased time commitment involved in leadership training, the level of interpersonal and interorganizational trust is likely to be high. High levels of trust improve the effectiveness of planning activities and strengthen the interactive relationships. Community members consistently indicate a desire to be included in all phases of disaster planning (Karanci and Aksit 2000). The inclusion of these typically vulnerable communities in the planning, response, and recovery phases also improves overall community resilience. It also reduces underrepresented groups' vulnerability as effective mitigation projects incorporate local knowledge and preferences. Due to the inclusion of community members in the planning process, outcome acceptance is increased (Mitchell 2008).

Because the formal disaster relief system is designed to respond financially and measures recovery in economic terms, the economic goals of the socially powerful are more often represented in rebuilding efforts. This may result in the disintegration of the preexisting social networks by separating many of the vulnerable community members from their place-based linkages. This permanent dislocation of the vulnerable community results in greater vulnerability for the poor and ethnic minorities. This increased vulnerability naturally diminishes the resilience of the overall community.

Community activism may counteract the trend to underrepresent more vulnerable groups. Morrow and Enarson (1996) illustrate this form of activism through their study of women's experiences during the aftermath of Hurricane Andrew. Following their virtual exclusion from the formal "We Will Rebuild" recovery planning committee, women from economic and ethnically vulnerable neighborhoods created a counter-group, "Women Will Rebuild." This group was able to gain enough political momentum to force the more pre-disaster powerful institutional structure to include them in a meaningful way. The authors concluded that intentional involvement of women reduced gender-based vulnerability and increased the adaptive capacity of the overall community.

Past research has examined the organizational structures of emergent CBOs (Luft 2009) and mobilization of ethnically focused CBOs (Anderson 2008). Research examining the potential of incorporating CBOs into the recovery process has focused on economic development and physical rebuilding (Alexander et al. 2006; Berke and Beatley 1997; Ganapati 2009; Gotham and Greenberg 2008), disaster preparedness and response (Alexander et al. 2006; Chen et al. 2006; Mimaki et al. 2009; Newport and Jawahar 1998; Patterson et al. 2010; Rodriguez et al. 2006), or political change (Blocker et al. 1991; Cable and Degutis 1991; Goldstein 2007; Olson and Gawronski 2003). Nakagawa and Shaw (2004) link social capital, CBOs, and recovery but do not examine long-term effects regarding overall resilience. In examining the failure of formal response and recovery organizations to meet the needs of the residents of New Orleans following Hurricane Katrina, Mitchell (2006) proposed that the integration of CBOs into a networked recovery process would improve the rate of recovery and resilience overall.

## Conclusion

Inclusion of disadvantaged communities in planning, preparation, mitigation, and recovery activities appears to be a key to increasing community social capital and resilience. This effect may be greatest in economically disadvantaged communities and assist in ameliorating poverty (Brown 1991; Saegert 2001; Woolcock 2004). Patterson et al. (2010) point out that inclusion of vulnerable people in the planning process is not enough. Vulnerable people and communities must be considered full participants in throughout the entire disaster cycle. Their input must be valued and incorporated in the resulting plans and strategies.

The partnerships created from the inclusion of vulnerable communities must be meaningful and based on trust.

# Community-Based Organizations

Osaore A. Aideyan
Department of Politics and Government, Illinois State University, Normal, IL, USA

## Synonyms

Grassroots development organization

## Definition

A bottom-up approach for popular participation in development efforts. It is an innovative approach to developing communities in response to the failure of top-down development strategies.

## Introduction

Community-based organizations (CBOs) are non-profit membership organizations (public or private) open to all residents of the physical community (a neighborhood for example), and focused on issues and concerns at the local level. They are institutional blueprints for improving citizen's abilities based on local sociocultural conditions (Dill 2010). The primary purpose of community-based organizations is the improvement of the physical, economic, and social environment of its geographic area of operation. They achieve these goals by addressing one or more critical problems of the area – housing, health, education, microfinance, safe water, and sanitation. Most CBOs focus their attention on the needs of persons of low and moderate income.

Community-based organizations can be identified by a number of names, including association, networks, alliance, and commission. Examples of community-based organizations are the local Chamber of Commerce, Advisory Neighborhood Commissions (ANCs), and Transportation Management Association (TMA).

As a democratic instrument to bring about sustainable change, CBOs have the following characteristics:

- First, they are governance institutions that improve the ability of citizens to make choices through open and public discussions, and direct involvement in the design and implementation of programs that affect particular communities. This is in contrast to institutions where transnational bureaucrats are empowered to determine what happens to people who live long distances from power centers. According to Evans (2002, 55), this model of development "implies that choices about those allocations and growth strategies must be democratic not in just the thin sense of having leadership succession determined at regular electoral process, but in the thick sense of messy and continuous involvement of the citizenry in the setting of economic priorities." In essence, COBs are a means to empower citizens vis-à-vis development (Dill 2010).
- Second, ownership of the development process by the people. According to the United States Department of Transportation, a community-based organization focuses on issues and concerns at the local level, not on a national scale. They may also participate in regional coalitions with similar groups in support of an issue such as affordable housing, water quality, or connection of open space (U.S. Department of Transportation 2002). Accordingly, they are able to represent and advance the interests of particular target communities. Likewise, Dill (2010) notes that since CBOs are formally distinct from state institutions, they are assumed to represent and advance the interests of a particular community, granting them license to make claims on target audiences, namely, national and transnational development actors.
- The third component of CBOs as a development paradigm is that the effectiveness of development institutions depends upon their ability to work with the grain of the local

sociocultural environment. Values should not be exogenous. They should be compatible with the cultural norms and practices of each community (Dill 2010).

- A fourth characteristic of CBOs focuses on their size and organizational structure. Whether the CBO is organized as in informal steering committee, a traditional board, or a complex network of organizations, the majority of the leadership positions and staff consists of local residents. In addition, the main operating offices are located in the community. The following are examples of organization members: individual members of the public, representatives of community and advocacy groups, church leaders, representatives of the business community, and elected officials. Depending on each organization, members may volunteer or may be nominated, appointed, or elected (U.S. Department of Transportation 2002). Many community-based organizations hold regular meetings for a specific period where they discuss the issues of common concern. Though participation is voluntary, meetings are open to all members of the community with interest in the particular issue (U.S. Department of Transportation 2002). Most CBOs sustain themselves through the collection of membership and annual fees (Dill 2010).

Community-based organizations do not exist in a vacuum. They must establish local relationships as well as partnerships with state and federal agencies and organizations throughout the public, private, and nonprofit sectors (West 2009). Effectively, they serve as intermediaries between national actors and transnational actors and community residents.

## Utility of Community-Based Organizations

According to the U.S. Department of Transportation (2002), working with CBOs allows professionals in different sectors of the economy to tap into key community players and an organizational structure that has already been created. For example, regularly scheduled meetings of CBOs can be avenues for disseminating information and gathering input on transportation plans, programs, and projects at a grassroots level.

CBOs can also be used to gain consensus about an issue or a project. In this sense, they can serve as platforms for identifying and investigating particular issues in more depth, gaining community level information, and community impact assessment (U.S. Department of Transportation 2002).

Since community based-organizations are typically organized at the grassroots level, participation tends to be broad-based. Effectively anyone can be active in such a group, which promotes bridging relationships as opposed to bonding relationships.

## Models of Community-Based Organizations

West (2009) has introduced three basic models of community-based organizations that are representative of the numerous such types of organizations. They are categorized as follows: independent organizations, networks, partnerships, or regional initiatives. We add to this list other community-based organizations frequently cited in the literature. These are foundations and faith-based community organizations.

### Independent Organizations

Perhaps the most representative of this type of community-based organization is the local Chamber of Commerce. Their organizational structures usually consist of a volunteer board of directors with committees responsible for different issue areas. Typically, they pursue a variety of interests including economic development, leadership programs, community promotions, governmental affairs, and are diverse as the communities they serve (West 2009, 108).

Another type of community-based organization that is representative of fundamental organizational forms of CBOs is community

development corporations (CDCs). They are the principal vehicle for community development. These nonprofit organizations serve a particular geographic area and are normally controlled by its residents. A board of directors usually elected from the membership governs CDCs and may also have board positions reserved for representatives of key local institutions such as banks, city government, or the hospital. A paid staff and volunteers execute the programs of work.

CDCs are best known for their production of affordable housing. However, CDCs do more than just construct housing, and instead engage in a range of activities from small business development to workforce training to social service provision (DeFilippis and Saegert 2012).

### Networks

These are collaborative community-based organizations pulling resources together to achieve common goals or solve problems too large for one organization to tackle. By collaborating, organizations are able to leverage power of numbers in exercising influence, and maximizing limited resources of communities.

Networks might exist to exchange information among organizations or businesses that share common interests such as trade associations (West 2009). Other networks consist of numerous CBOs engaged in the provision of services from the local to the international levels.

Other notable networks that are important economic development tools are flexible manufacturing networks (FMN) and business cooperatives. FMNs may engage in simple collaborative efforts like sharing of information to jointly own production facilities or share information technology infrastructure. Business cooperatives are community-based organizations established to provide a range of services for local businesses ranging from identifying business opportunities to providing support services, access to capital and cooperatively owned equipment.

### Public-Private Partnerships

These are collaborative arrangements between the public and private sectors which involves the public partner paying, reimbursing, or transferring a public asset to a private partner in return for goods or services. Although controversial in terms of its benefits for taxpayers, supporters of PPP cite cost savings, innovations, and improved quality of services as some of the potential benefits of this arrangement. Opponents on the other hand cite increase in unemployment and violations of statutory laws as key drawback of PPPs.

According to the US National Council for Public-Private Partnerships (2002), there are at least three different levels of public-private partnerships (PPPs), outsourcing, privatization, and a combination of both outsourcing and privatization. Outsourcing is the process of contracting by a public agency for the completion of government functions by a private sector organization. For example, contracting maintenance for a city hall to a private enterprise. Privatization on the other hand, is the sale of government owned assets to the private sector. For example, when government turns over prison functions to provide providers.

### Regional Initiatives

According to West (2009), regional initiatives provide a framework for addressing society's most complex problems. Very often these are problems that no one community or political administrative division can handle alone thus requiring some forms of collaboration with others. Issues relating to air quality, infrastructure investments, transportation, and economic development that are well beyond the ability of one municipality fall in this frame of reference. Regional initiatives can be very useful in economic development.

Regional development initiatives involve formal institutional designs, shared decision making, and participation of governing bodies in the region. Depending on the objective, project scope, actors, and timing, these institutions vary structurally. They can take the form of consolidated government functions such as combining police forces to address safety and security issues across multiple jurisdictions, special districts

in-charge of providing social services and amenities, and special taxing districts (West 2009).

By coming together to create regional marketing organizations this form of community-based organizing has been identified as one of the best tools for rural communities that otherwise would not have the resources to market themselves, or even to develop infrastructure by themselves.

### Foundations

These are nonprofit, tax exempt public charities primarily funded by contributions from individuals, corporations, government units, and private foundations (West 2009). Most community foundations focus more on grant making than on providing direct charitable services to the locality. Community foundations are usually endowed by individuals or groups and may be for general or specific purposes.

### Faith-Based Community Organizations

Faith-based community organizations are nonprofit providers of unique services to communities. They are unique in the sense that not only they do meet the spiritual needs of community members, they are known for providing food, clothing, and shelter to community members in need. More recently, with governmental assistance, faith-based organizations have expanded into workforce training and housing initiatives.

According to the US Department of Housing and Urban Development (2001), there are three types of faith-based organizations (FBOs) – congregational, national networks, and freestanding religious organizations. Congregational organizations are more representative of FBOs because of their affiliations with denominational organizations such as the Catholic diocese, and their service organizations, such as the Jewish Federation or Notre Dame University. National networks are special purpose providers formed to mobilize energies of individuals and congregations around specific projects such as Habitat for Humanity or the Christian coalition. Freestanding religious congregations are independent organizations that are not part of a congregation but have a religious connection organized to pursue special development objectives.

## Conclusion

Community-based organizations are effective bottom-up tools used for addressing local needs. They embody a multiplicity of formal institutions, interests, and activities to meet the ever-changing conditions and needs of local communities. CBOs often incorporate elements of community organizing that empower individual members of society to take charge of their destinies. CBOs by their nature are well positioned to coproduce public goods by mobilizing an untapped pool of local human, financial, and material resources (Dill 2010). However, the demands of participation might place unusual financial and social burdens on low-income persons in the community.

# Company Structure and Legal Implications

Lorna Hardin
Penn State DuBois, DuBois, PA, USA

## Synonyms

Business form; Business structure; Entity form

## Introduction

Soon after any entrepreneurial activity begins, the entrepreneur will receive requests for information. For example, tax authorities will want to find out how much income the activity generates. Providers of capital (including creditors and potential investors) will want to see financial records for the activity before supplying the funds needed to scale up. Insurers will require information about aspects of the organization that they are insuring (e.g., inventory). To fulfill information needs, separate records must be kept for the economic activity, apart from the entrepreneur's personal financial records. At this point, the entrepreneurial activity will necessarily gain an identity that is separate from its founder. It will become a separate entity.

Globally, many governmental jurisdictions allow entrepreneurs to choose the legal form for a new entity from a pre-established set of forms permitted in that jurisdiction. Applicable laws stipulate the prerogatives and obligations of the entity based on the type of organization that the owner has chosen to "house" specific economic activity. The choice of entity form represents a trade-off between the advantages and disadvantages that available entity forms confer, based on the characteristics of the economic activity involved and the priorities of the entrepreneur. Entrepreneurs should think about entity form at the inception of any economic activity and periodically afterward. Having chosen a legal form, entrepreneurs must typically file legal documents with the governmental jurisdiction in which the entrepreneur wishes to operate. In the United States, entity form is a matter of state law with variations in related legislation among the states. Internationally, entity form may be governed at the federal level.

The chapter is organized as follows. First, the choice of entity form has implications related to control, tax effects, legal liability, ability to raise capital, continuity of existence, and required legal filings. A brief overview of these issues is provided. Second, common entity forms are described in light of these key parameters. Finally, several matters that are integral to the choice of entity form are described. These matters include jurisdictional considerations, the need to reevaluate entity form, advantages of operating a group of related entities, and the importance of tailoring the legal form of an entity with well-written organizational documents.

## Key Parameters

One way to conceptualize the differences between entity forms is to consider the parameters that differ across available options. Entrepreneurs must weigh these parameters in light of the unique circumstances surrounding their own business.

## Control

Control refers to the question of who is legally authorized to make decisions on behalf of an entity. Important decisions include choosing how to finance the operations of the organization, which assets to deploy, and what opportunities to pursue. In a sense, an entity is defined by the person or group with authority to enter into contracts on behalf of the entity. This is true because an entity's contracts collectively set its strategic focus. Intuitively, it would seem that the owners of an entity would legally control it, yet exceptions exist. Entrepreneurs should understand that the choice of entity form can affect their ability to retain control of the organization and its operations.

## Tax Effects

Taxes assessed on income from economic activity can differ markedly because of the entity form that is chosen to house the activity. The costs of compliance with tax laws can differ significantly as well, depending on the complexity of required tax returns. Nevertheless, the higher tax cost associated with a particular entity form may be warranted if the form confers other benefits that allow the organization to thrive.

## Legal Liability

Entrepreneurs face two major sources of financial exposure, including the risk of insolvency and the risk of being held financially responsible for damages arising from entrepreneurial activities. To varying degrees, entity forms can be used to shield individual owners from personal legal liability for losses arising from the organization. Concerns about legal liability may or may not be a primary concern in the choice of entity form, depending on the nature and scale of operations.

## Ability to Raise Capital

Very often, organizations will seek outside financing in order to fully realize the potential of a good business plan. For example, debt may be used to buy assets such as property and equipment that will increase output capacity. Alternatively, entrepreneurs seek investors to contribute cash or other assets in the effort to scale up operations. Some entity forms are more amenable to growth through external financing than others.

## Continuity of Existence

Dissolution of an organization is not an issue in daily operations. Nevertheless, a plan for dissolution (or continuity) of the organization should be put in place long before the issue arises in practice. A fundamental question here is whether the organization continues to exist after the departure of an owner. The answer is dependent upon the entity form. Owners may leave a business for several reasons, including death or disability; sometimes an owner decides to sell or is forced to leave following disagreements with co-owners. While it is true that the assets and employees of a business physically remain in such cases, continuity of existence refers to the legal existence of the entity. Pre-planning for such events is critically important because if the organization ceases to be recognized as a legal entity, the contracts of the organization (with suppliers, employees, customers, and creditors) and, by extension, its operations will be disrupted.

## Required Filings

Before commencing operations, an organization is required to submit organizational documents to the government unit that will exercise jurisdiction over the new organization. In the United States, for example, individual states govern entities. Accordingly, organizational documents are filed with the secretary of state. Periodic filings are also required as a condition of continuing to operate legally. Dissolution is accomplished through submission of yet more filings. Tax returns represent an additional obligation. Entrepreneurs seldom have the necessary experience to maintain compliance with required filings; typically, an accountant, attorney, or both must be enlisted to assist with this responsibility. Entrepreneurs who fail to comply with filing requirements will incur fines and penalties in excess of filing costs. Worse, government entities are authorized to terminate entities that fall out of compliance. Thus, paperwork is a necessary part of the operation of an entity. Entrepreneurs should be aware that the financial burden of required filings varies across entity forms.

## Entity Structure

The key legal issues identified in the foregoing discussion exist for organizations worldwide. That said, available legal entities are established by

individual jurisdictions and variations occur. Typical arrangements are described in the following paragraphs with a focus on prevalent forms in the United States. In practice, the selection of a legal form should be made with the advice of professionals who are well-versed in local laws. The choice of entity form entails a process of deciding how important each of the factors is to the success of a given entity and selecting the best fit among available alternatives. Five broad classes (or types) of entities are described in the following paragraphs, including sole proprietorships, partnerships, limited liability companies, corporations, and exempt organizations. Note that several entity forms may exist within a class of entities, each differing from the others in terms of the key parameters described previously.

## Sole Proprietorship

At the most informal level, a business entity may be one individual (the proprietor) who owns and operates an economic activity for profit. This entity form is a sole proprietorship (Internal Revenue Service 2019, p. 3), by far the most common entity form (Statistics of US Business 2017; Nonemployer Statistics 2018). A sole proprietor has complete authority to make every decision regarding the business. An entrepreneur without partners has other options in terms of entity form (depending on the jurisdiction), such as a limited liability company (National Conference of Commissioners on Uniform State Laws 2006, Art. 2, Sec. 201(a)). By definition, however, the entrepreneur who has not made legal filings to separate the finances of the economic activity from his personal financial affairs is operating a sole proprietorship. In essence, there is no need to choose a sole proprietorship as the entity form because it is a default status.

If the entity were separated from the entrepreneur, it would be required to file separate tax returns. In the United States, a sole proprietorship declares its income and is taxed on the proprietor's individual tax return. The simplicity of filing both individual and business taxes on a single return is a benefit of organizing as a sole proprietorship.

The lack of a legal firewall between the individual and entity can be a drawback of operating as a sole proprietor. Because the entrepreneur and the activity are a single legal entity, the proprietor is personally responsible to pay debts of the proprietorship if the economic activity does not generate enough cash to pay them. In other words, the sole proprietor has unlimited legal liability for the debts of the sole proprietorship (Internal Revenue Service 2015, p. 3). In many cases, unlimited liability is not an issue. Sole proprietors can insure the physical assets of a business. Employees can be insured for any injuries that occur on the job. Liability insurance can be used to cover losses from customer claims of injury. But insurance policies have limits, and no insurance company will provide blanket coverage against insolvency.

The specific circumstances are relevant in the determination of whether unlimited liability is acceptable. For example, a restauranteur leasing 10,000 square feet and employing a full staff has more exposure to losses than a consultant who works from home and has no employees. In general, entrepreneurs whose businesses have high fixed costs, a long production cycle, or uncertain profits have higher exposure to losses. In these situations, an entrepreneur could shield personal assets from the business' potential insolvency by using a different entity form that will separate the business from the owner, thus limiting the entrepreneur's exposure to personal legal liability.

Sole proprietorships primarily fund growth using either the entity's profits or borrowings. An entity is more likely to "outgrow" the sole proprietorship form if the strategic plan includes rapid growth because sole proprietorships lack access to sophisticated financial arrangements that are used by larger companies to raise capital (e.g., issuance of stocks and bonds). Sole proprietorships are typically small entities (SUSB 2017), due in part to their relative inability to raise capital. In fact, improved access to capital is often the goal when sole proprietorships are converted by their owners to other entity forms.

A sole proprietorship does not offer continuity of existence because of the legal view that the organization and the owner are one and the same. In essence, the business ceases to exist if a

sole proprietor becomes incapacitated or dies. To be clear, the assets will remain and are subject to inheritance laws, but a disruption in operations is likely to occur during the time that such matters are resolved.

Despite the lack of legal formality associated with a sole proprietorship, some legal filings are required. For example, local or state governments may require a sole proprietor to register with the state, purchase a business license, or furnish evidence of liability insurance. The tax return will be slightly more complex (and professional fees more costly) with the addition of information about the business. Formation of the business is less costly, however, because a sole proprietor is not required to transfer the titles of assets used in the business over to the business itself since the business has no legal existence apart from its owner. For the same reason, dissolution is also streamlined. The relative absence of required paperwork associated with a sole proprietorship likely accounts for its status as the most common organization form.

In summary, the sole proprietorship is a simple, for-profit entity form in which the entrepreneur and the business are legally undivided. The entrepreneur has complete legal control over the entity as there are no additional investors with an ownership stake. Income from the business is taxed as the entrepreneur's personal income. The entrepreneur is responsible for financial obligations of the business. The business' ability to raise capital is limited to the financial resources of the entrepreneur. Lacking an independent identity, the business has no continuity of existence. Finally, the burden of legal filings is the lowest of any entity form.

## Partnerships

A partnership exists when multiple individuals co-own an economic activity (NCCUSL 1997, Art. 2, Sec. 202(a)). There are three basic types of partnerships: general, limited, and limited liability. A partnership is a separate legal entity from the partners (NCCUSL 1997, Art. 2, Sec. 201(a)). Partnerships can own property (NCCUSL 1997, Art. 2, Sec. 204), an arrangement which confers some protection to the partners from personal financial distress of other partners. In the event that one partner incurs unpaid personal debt, creditors can legally sue for title to that debtor partner's share in the partnership but cannot take ownership of individual assets of the partnership, since partners do not directly own assets of the partnership. A creditor that is granted possession of a partnership share is entitled to a proportionate share of the profits of the partnership, but mutual agency does not extend to the creditor (NCCUSL 2006, Art. 5, Sec. 502, 503).

In the United States, 44 states have adopted the Uniform Partnership Act of 1997 ("RUPA"), a piece of legislation that stipulates how general and limited liability partnerships operate by default and also how the partnership agreement may alter the default rules. As a result of widespread adoption of the RUPA, there is substantial consistency across states. Internationally, partnerships are common, but variation in rules exists. Limited partnerships are not governed by the RUPA. Partners are not required to be natural persons. For example, individuals, trusts, estates, corporations, and even other partnerships may be a partner.

## General Partnership

In practice, an informal general partnership may operate as multiple sole proprietors working together. In time, however, questions about the status of the organization may be raised, for example, due to a tax audit, a supplier or customer lawsuit, or a legal dispute between the proprietors themselves. If two or more individuals operate a business together informally (without declaring the entity form of the business in paperwork filed with the controlling jurisdiction), the business will legally be deemed a general partnership. Quite frequently, co-owned businesses operate as general partnerships out of inertia rather than intent. In a general partnership, each partner can serve as an agent of the partnership, committing the partnership to contracts in support of ongoing operations. The resulting shared control of the

organization is called "mutual agency." While mutual agency is the default arrangement, partners may alter the terms of mutual agency by any agreements that the partners make to limit shared control.

The partners have what is called joint and several responsibility for the debts of the partnership (NCCUSL 1997, Art. 2, Sec. 306). Joint liability means that all partners are collectively responsible for partnership debt, while several liability means that one partner may be held responsible for all partnership debt if the others lack funds to pay the debt. One fundamental drawback of a general partnership is that every partner has legal exposure for losses stemming from the acts of other partners. Depending upon the kind of operations housed by the partnership, this could be an untenable situation. For example, medical doctors, dentists, and engineers commonly assume financial risks in conjunction with their professional work.

## Limited Liability Partnership

For many professionals, limited liability partnership (LLP) may be more appropriate than a general partnership because it protects each partner from losses due to negligence or misconduct of other partners. Partners in LLPs do not automatically have decision-making authority (NCCUSL (2006), Art. 3, Sec. 301(a)). Depending upon the jurisdiction, the law may restrict the use of an LLP to members of specific professions. Again, depending upon the jurisdiction, an LLP may further shield partners' personal assets by limiting the partners' liability for debts of the partnership to the amounts they have invested.

## Limited Partnership

The third type of partnership, a limited partnership (LP), is different in operation than general or limited liability partnerships. A separate piece of legislation governing LPs, the Uniform Limited Partnership Act of 2001 (ULPA) has been adopted by 24 states. An LP must have at least one general partner and one limited partner (NCCUSL (2001), Art. 2, Sec. 201(d)). The general partner (or partners) exercises control. Limited partners do not have authority (agency) to make decisions on behalf of the organization (NCCUSL (2001), Art. 3, Sec. 302(a)). Their liability for debts of the partnership is limited to amounts they have invested in the partnership (NCCUSL (2001), Art. 3, Sec. 303(a)). In contrast, general partners' liability for debts of the partnership is unlimited (NCCUSL (2001), Art. 4, Sec. 404(a)).

A limited partnership may be a good fit for an entrepreneur who wishes to retain control of a relatively capital-intensive business such as a restaurant, real estate management, or oil and gas exploration. One or more general partners will raise capital by selling partnership interests to limited partners, who are passive ("silent") investors. The capital supplied by limited partners is used to purchase productive assets. The general partner will then manage the assets to generate income, often receiving a salary and other compensation. Limited partners share in the profits, typically receiving quarterly or annual distributions. Numerous limited partnerships are often managed by a single general partner. Each partnership may contain, for example, a single asset such as a building or gas well. With each successive project, limited partners choose whether to invest and, if so, how much. Limited partners' proportion of ownership interest in the project is determined by the amount of their investment.

## Issues Common to All Partnership Types

Partnerships have flexibility when compensating individual partners. Partners need not be paid equally. Depending upon the jurisdiction, general partners may be required to draw a reasonable salary, which is subject to payroll taxes. Partnerships are taxed under a variety of schemes at the state level (and internationally). For example, a flat fee may be assessed, or a tax may be applied to the revenues, income, or assets of the partnership.

In the United States, the Internal Revenue Service requires businesses to self-identify their entity type under the "check-the-box" regulations

(Treas. Reg. § 301.7701-2(a)). This choice in turn determines the method by which federal income tax will be assessed. One reason for this system is that states recognize many business entity types, while the federal government for tax purposes recognizes only three: a corporation, a partnership, or an entity that is disregarded as separate from its owner. If an entity is recognized by its local jurisdiction as a corporation, it is subject to corporate income tax at the federal level. Corporation income tax is described in the section on corporations. If an entity has only one owner (and is not a corporation), income from the entity is taxed to the individual owner as if no entity exists. If an entity has two or more owners (but is not a corporation), the entity is taxed as a partnership. (The US federal tax system permits several entity types to be taxed as partnerships (i.e., pass-through entities) including general and limited partnerships, LLPs, LLCs, and S corporations. Some of these entity types will be described later in this text. Entities that would otherwise be taxed as pass-through entities may elect to be taxed as corporations, but this is almost always disadvantageous for reasons that will become clear in the discussion of corporate tax.) Under federal partnership tax rules, the entity's income is allocated ("passed through") to the individual partners and taxed as income at the owners' individual tax rates. Pass-through taxation is also a common treatment for business income internationally. Depending upon what the partners have agreed to do, the partnership's income may be distributed to the partners or retained in the partnership to fuel growth. Either way, each partner is individually liable for taxes owed on his or her share of partnership income. In essence, the tax is triggered by the earning of the income rather than its distribution.

Under the Tax Cuts and Jobs Act of 2017 (H.R.1 2017), individuals with pass-through income may be eligible to deduct 20% of that income before calculating their tax liability. Several caveats apply. In order to take advantage of the deduction, a taxpayer must have income above a certain threshold. If the source of the pass-through income is services provided by the owner, the deduction is phased out after income exceeds certain thresholds. The high-income phaseout does not exist for entities that are not involved in providing personal services, for example, for manufacturers. Finally, the deduction is scheduled to be phased out in 2025. While the details of the 20% deduction are beyond the scope of this text, it represents a significant benefit to taxpayers who operate pass-through entities.

US tax law is quite flexible in terms of how taxable items may be allocated to partners. So long as the allocation follows a plan that is recorded in the partnership agreement, it is not necessary to allocate income (or losses) in proportion to the partners' ownership shares in the partnership (IRC §704(a)). This flexibility can result in tax savings for the partners. For example, if one partner can derive more benefit from tax credits owing to his or her personal tax situation, the partnership agreement can stipulate that 100% of tax credits will be allocated to that partner.

When a partnership is formed, partners frequently contribute separately owned productive assets to the partnership (e.g., real estate, equipment). For reasons discussed later under required legal filings, partners should either title contributed assets to the partnership or execute a written agreement between the contributing partner and the partnership that sets the terms by which the partnership may use the asset. One benefit of the partnership form compared to a sole proprietorship is that raising capital for growth is facilitated by the fact that multiple owners can pool their individual resources. At the same time, a corporation may offer even greater access to capital than a partnership, for reasons that are discussed in the section about corporations.

Rules related to continuity of existence are inconsistent across jurisdictions, both in the United States and internationally. In some jurisdictions, the withdrawal of a partner triggers dissolution of the partnership by law. Under RUPA (governing general partnerships and LLPs) and ULPA (governing LPs), partnerships are not dissolved solely because a partner withdraws. Even so, withdrawal of a partner will trigger dissolution in some situations. For example, all partnerships must have at least one partner, and an LP must have at least one general partner. If all

partners withdraw from a partnership or the general partner withdraws from an LP, the partnership dissolves. Continuity of ownership is beneficial because unintended dissolution of the partnership may be disruptive to operations and have negative effects on the financial status of everyone involved.

As previously discussed, a small general partnership may operate informally, given an abundance of cooperation between owners. When the business begins to acquire assets or hire employees, the partnership should be registered with the jurisdiction in which it will operate. If the business was licensed as a sole proprietorship, new filings should be submitted to reflect the new partnership status. Organizational documents, such as a partnership agreement and operating agreement, must be drafted and filed with the jurisdiction. Although partnerships are not directly subject to income tax, an informational return must be filed to show how income and other taxable items of the partnership are being allocated to the partners.

If partners contribute separately owned productive assets for the partnership's use, all partners should be aware of and agree upon the value of contributed assets. Appraisals may be sought. One reason is that the partners' proportionate share of equity in the partnership is affected by their contributions. It is also critically important to either transfer legal ownership of such assets to the partnership or to memorialize an agreement between the owner and the partnership of the terms under which these assets may be used. If the partnership fails to take title to, or execute an agreement governing the use of, the productive assets, the owner-partner retains the right to block the partnership from using the asset, potentially disrupting operations. Partners should also be cautious when paying for upgrades to individually owned assets out of partnership funds, because this effectively enriches one partner at the expense of the partnership.

Dissolution of the partnership requires payment of partnership liabilities, a distribution of remaining partnership assets to the partners, and filing of final tax returns. The partnership must also apply for and receive clearance from the jurisdiction, for example, verifying that all payroll and sales taxes liabilities have been satisfied.

In summary, the partnership form involves a transition from the complete control exercised by proprietors to mutual agency. Compared to a proprietorship, a partnership provides greater access to capital. Limited liability or limited partnerships offer limits to partners' personal liability for partnership debts, although in practice, creditors frequently request partners to personally guarantee indebtedness. Taxes are no greater than those imposed on a proprietorship, but a partnership is required to file an informational return. The extent to which a partnership provides continuity of existence varies across jurisdictions. The burden of legal filings is greater for a partnership than a sole proprietorship, particularly during organization and dissolution. But required filings establish the partnership form, which provides access to capital and protects individual partners by limiting their personal liability for business debts and preserving their equity claims against other partners.

## Limited Liability Corporation (LLC)

A limited liability company (LLC) is often described as a hybrid between a partnership and a corporation, although LLCs need not have multiple members. LLCs provide their owners with remarkable flexibility. Many LLCs effectively combine the advantage of pass-through tax treatment accorded to partnerships with the limited liability of a corporation. In the United States, the LLC is a relatively new entity form, but every state now allows LLCs to organize, and 20 states have adopted the Revised Uniform Limited Liability Company Act (NCCUS 2006).

Because of the short history of LLCs in the United States, laws related to their operation are not yet settled, and a lack of uniformity exists across jurisdictions. Against this backdrop, two implications are of note: First, the organizational documents for an LLC should include a clear and comprehensive operating agreement that is tailored to the needs of the owners. Second, a limited liability corporation that operates across jurisdictional boundaries should be careful to register as a

foreign LLC in each jurisdiction to ensure that the operating agreement (rather than local law) will be used to settle any legal dispute.

Despite these challenges, the LLC has rapidly gained prevalence in practice. Growing sole proprietorships often choose to convert to an LLC. Owners of LLCs are called members. Depending upon the state of organization, an LLC may have an unlimited number of members, and similar to the rules for partnerships, members need not be natural persons (NCCUSL 2006, Sec. 1007).

An LLC may be member-managed or manager-managed (NCCUSL 2006, Sec. 407(a)(1)). If the operating agreement does not designate the LLC as manager-managed, it is member-managed by default. Members of a member-managed LLC are assumed to be agents of the LLC and to share equally in management decisions (NCCUSL 2006, Art. 4, Sec. 407(a)(2)). The operating agreement should include a statement of authority describing the control of the organization. The limited liability corporation should meticulously follow procedures set forth in the statement of authority. If an unauthorized representative of the LLC engages in transactions with a third party who is unaware of the proper lines of authority, the LLC may be unable to later invalidate the unauthorized representative's agency on behalf of the LLC.

Some jurisdictions limit the types of economic activities that LLCs can be used to operate. For example, licensed professionals may be required to use a different entity form, such as an LLP. LLCs are nearly always subject to partnership tax rules, both internationally and in the United States. The LLC form shields its members from personal liability for LLC debts. Members' personal exposure to loss is limited to amounts invested in the LLC. The proportion of an investor's ownership is typically based on the funds that the investor has contributed to the LLC and is expressed as a percentage denoting the proportion of the LLC that the investor owns. Alternatively, some LLCs allow investors to purchase ownership in equal denominations (referred to as "units"). Investors wishing to invest more in the LLC purchase additional units. LLCs with multiple members have improved access to capital as a result of pooling funds. The existence of an LLC is not affected by the departure of members. The operating agreement can stipulate the terms under which members can sell their ownership share of the LLC. For example, existing members may be given right of first refusal. Existing members may also reserve the right to reject the sale of an LLC share based on the identity of a prospective buyer if the operating agreement so states.

The flexibility of an LLC is beneficial, but the costs of organization can be a drawback. The operating agreement should be drafted by a competent attorney who is familiar with local laws governing LLCs and willing to work collaboratively with the founding LLC members in stipulating the rules of operation. Legal fees can be significant, but a well-written operating agreement can reduce the expense of litigating disagreements that arise during the LLCs existence.

## Corporation

In contrast to sole proprietorships and some partnerships, the corporate form is a separate legal entity from its owners. In the United States, about half of the states have adopted the Model Business Corporation Act (2002). Without exception, corporations can enter into contracts and, by extension, can be the plaintiff or defendant in a lawsuit. In the United States, several Supreme Court decisions have established that corporations enjoy equal protection under the law, which means that government agencies cannot discriminate against a corporation in the execution of laws or in the operation of the courts, for example, due to the corporation being registered outside the jurisdiction of the court or due to the mere fact that the entity is a corporation.

Control of a corporation is diffuse by design. The corporate charter or articles of incorporation must set the number of ownership shares that a given corporation is authorized to issue to investors. The process of dividing an asset (such as a company) into many equal, smaller ownership shares is called "securitization." Ownership shares of the corporation are called "stock." This arrangement is in contrast to how ownership

shares of most other entities are handled, where the proportion of ownership is flexible based upon the amount of the owner's initial investment. In a corporation, investors, who are also called stockholders, may buy additional shares to increase investment.

Stockholders lack mutual agency; corporations are manager-managed, as opposed to owner-managed. Owners of stock typically are accorded one vote per share of stock, although a few corporations have multiple classes of stock in order to vary voting rights among investors. For example, a particular class of stock may have no voting rights, or super voting rights. Stockholders vote to elect a board of directors, who represent the shareholders' interests. Directors nearly always hold stock in the corporations they serve. The maximum number of directors is stipulated in articles of incorporation. Directors may also be employees of the corporation, but not by virtue of their directorships. Instead, directors are self-employed. They engage in strategic, long-term planning and provide independent oversight to the management team, which is responsible for daily operations of the firm. Boards of directors may meet monthly or quarterly, although they work on corporate initiatives between meetings.

Founders of corporations can maintain control of their corporations by owning a majority (or all) of the voting stock and serving simultaneously as directors and management. Directors who are employed by the firm are called "inside directors." Directors who are not employed by the firm are called "outside directors." Outside directors are chosen for specific expertise. For example, directors are often attorneys, financial services professionals, or retired executives with experience and connections in the industry in which the firm operates. Outside directors are invaluable because their independence from management allows them to provide objective feedback to the management team. Stockholders' control over the corporation is limited to voting to replace unsatisfactory directors with new directors who will presumably provide better guidance and management oversight.

Corporations are subject to varying tax regimes at the local and state levels (as well as internationally). Taxes may be imposed on gross revenues, assets, or income. Some jurisdictions charge a flat annual fee. A drawback of the corporate form in many countries (including at the federal level in the United States) is that corporate income does not pass through to stockholders until it has been taxed at corporate tax rates. Some corporate income (net of corporate taxes) is then distributed to stockholders as dividends, which are taxable a second time as income to the stockholders receiving the dividend. Notice that tax at the individual level is triggered by the payment of dividends. In pass-through entities, tax is triggered by the earning of income, not its distribution. There is some ability, therefore, to defer the second, individual layer of tax associated with corporations by retaining the income of the corporation rather than paying it out. The opportunity to retain income is not absolute; some jurisdictions have rules about how much income can be retained, imposing financial incentives to distribute the corporation's after-tax income to stockholders.

The Internal Revenue Service offers an arrangement that mitigates the effects of the so-called double tax associated with corporations. A corporation may elect to be treated as an S corporation for income tax purposes (I.R.C. §1361(a)(1)). The name "S corporation" comes from the location of the rules for this entity type in the Internal Revenue Code: Title 26, Chap. 1, Subchapter S. This status does not affect the legal entity form as a corporation; it solely affects taxation. To qualify for S corporation status, a corporation must have a single class of stock, fewer than 100 stockholders, and all stockholders must be natural persons who are US citizens (I.R.C. §1361(b)(1)). Providing the requirements are met and stockholders elect to be treated as an S corporation, the entity is accorded pass-through tax treatment, identical to entities previously discussed, thus eliminating the double tax drawback of corporate status. Individual stockholders' tax liability for the income of the S corporation is triggered by the earning of income, rather than the distribution of dividends. Many S corporations exist, but the advent of the more-flexible LLC entity form in recent years has led to few new

S corporations being registered. In states where certain activities are barred from operating as an LLC, however, S corporations offer an alternative.

As a separate entity, a corporation provides the strongest protection from liability of any entity form. Even so, separation between owners and the entity may at times be disregarded, for example, by a court in settling a legal claim. If owners fail to treat the business as a separate entity, the courts will follow suit. By implication, owners should not co-mingle the funds of the business with personal funds and should keep separate financial records for the business. The owners should also maintain sufficient funds in the business to cover reasonable losses. The entity cannot be used to protect an owner from personal liability for misconduct (e.g., failure to maintain safety equipment, illegally dumping toxic waste). Finally, the owners must maintain the entity in good standing with the jurisdiction in which it is registered, which includes filing required documents (including tax returns) and paying tax liabilities and registration fees.

Corporations are uniquely able to raise capital due to their structure. Corporations are commonly run by professional managers with board oversight. This structure gives stockholders assurance that the company will operate with shareholders' interests in mind. In contrast, owner-managed entities put owners in a position to operate the organization in pursuit of their own interests. Further, stock can be sold easily due to its uniformity. Venture capitalists will provide an infusion of capital to companies only if they expect to see rapid, relatively short-term growth. These investors prefer to buy and sell stock than to find a buyer for less-uniform partnership shares. Because a corporation has a separate legal existence apart from its owners, the death or departure of a stockholder has no legal effect on continuity of operations.

Among the various entity types, corporations have the greatest paperwork burden at all stages of their existence. This is particularly true if the corporation raises capital by issuing stock to investors, because government entities will take an active role in protecting the interests of stockholders by requiring detailed reporting from the corporation. One aspect of this process is the need for an audit of the books and records of the corporation by certified public accountants. Separate tax returns for the entity are another added expense.

In summary, a corporation is more expensive to operate because it bears the burden of increased taxes and reporting. With the admission of additional owners, complete control is sacrificed, but founders can often maintain some control, and continuity of the organization is assured. The corporate form provides superior protection from personal liability to stockholders and the best access to capital of any entity form.

## Tax-Exempt Entities

Entrepreneurs should not discount tax-exempt entities without due consideration. Internationally, many jurisdictions allow analogous entity forms. Business activities at for-profit entities are aimed at generating profit. Economic activities undertaken by tax-exempt entities are focused on creating a societal good or furthering a specific cause. Most entrepreneurs will choose a business entity structure, but in some situations, organizing a tax-exempt entity (perhaps in conjunction with a separate business entity) is advantageous. A broad range of activities can qualify for the benefits of tax-exempt status including "organizations organized and operated exclusively for religious, charitable, scientific, testing for public safety, literary, educational, or other specified purposes," as well as "social welfare organizations, civic leagues, social clubs, labor organizations and business leagues" (I.R.C. 501(c)).

Tax-exempt entities do not have owners. Depending on the specific type of entity, they may be governed by boards of directors or, in some cases, a single person. If the tax-exempt entity uses a board of directors, daily operations are overseen by a manager, who may also serve as a director. With tax-exempt status, the entity itself captures any value created rather than the entrepreneur. For some entrepreneurs, the satisfaction of meeting a societal need or other positive aspects of the work may be more valuable than building financial equity.

Despite lacking ownership, the founder of a tax-exempt entity who serves as a director and manager retains effective control of the organization. Salaries for management at tax-exempt entities may be commensurate with salaries paid in the for-profit sector for similar work. Managers are shielded from personal liability in the same way that managers of corporations are.

Tax-exempt entities can certainly generate revenue from the sale of goods or services, but a major benefit of this form is that their income (with exceptions) is exempt from tax. As a result, more funds are available to pursue the organization's mission. Tax-exempts also supplement revenue with contributions from fund-raising. Donors to some (but not all) tax-exempt entities may deduct their contributions, a fact which incentivizes giving. A related benefit is that many tax-exempts receive services from volunteers. Because a tax-exempt entity is separate from its founder, there is continuity of existence as long as the organization has support for its mission.

Tax-exempt entities are required to produce numerous legal filings. Although they are exempt from income tax, they are required to file an informational tax return. It is not unusual for tax-exempt organizations to receive professional services (such as tax filings) at no cost.

Stand-alone tax-exempt organizations include healthcare providers such as hospitals and nursing and personal care homes. Cemeteries, historical sites, fine arts organizations, meditation communities, job training centers, animal sanctuaries, and many other types of activities can be run as tax-exempt entities. Exempt organizations can also be run in conjunction with related businesses. For example, a business that sells outdoor gear and wilderness excursions may sponsor a tax-exempt organization that promotes wilderness camping for young people. A well-known exempt entity, the Mozilla Foundation, describes its mission as "ensuring the internet always remains a global public resource that is healthy, open, and accessible to all" (Mozilla Foundation 2021). The Mozilla Foundation receives support from its taxable subsidiary, the Mozilla Corporation, the creator of the Firefox web browser. When a tax-exempt entity is paired with a related business, it can be mutually beneficial for both organizations. In many jurisdictions, there are statutory limits to the direct financial benefits that a business can derive from a related, tax-exempt organization, but some latitude often exists. Abusive transactions are referred to as "self-dealing." An example of self-dealing would be if a taxable entity overcharged a related tax-exempt entity for goods or services.

## Related Issues

### Jurisdiction

Each legally authorized entity form (e.g., a corporation) is defined by the legislative bodies, courts, and executive agencies of relevant jurisdiction. Specific provisions vary across jurisdictions. Each economic entity is responsive to multiple layers of jurisdiction (e.g., federal, state, local). Accordingly, an understanding of the laws applicable to a specific entity is essential to identifying the optimal entity form in practice. For example, certain kinds of activity may be precluded by law from operating under specific business forms in a given jurisdiction. The choice of legal form should be made with input from legal and financial advisors who are familiar with the laws of the jurisdiction in question as well as the dynamics of the organization.

Before leaving the topic of jurisdictional influences on entity form, it is worth noting that geographic presence is not the only means by which an entity may fall under the jurisdiction of a governmental agency. Business owners frequently register entities in jurisdictions where the entity has no physical presence in order to benefit from favorable laws or tax regimes. For example, many companies choose to register as Delaware businesses because Delaware has no business tax and the courts have expertise in contract law. As a second example, the US Supreme Court recently held that a state may require an online retailer to collect sales tax on goods shipped to the state, despite the retailer having no physical presence in the state (South Dakota v. Wayfair, Inc. 2018). These examples illustrate the importance of understanding jurisdictional opportunities and obligations.

Second, finding the optimal entity form is not necessarily a one-time decision. Particularly in early years, entities tend to undergo changes in focus, management, and even ownership. Milestones in the organization's organic growth may create opportunities to shift the entity to a more appropriate legal form. For this reason, it is good practice to review an entity's legal form when major shifts or changes occur in the life of an entity. Legal and financial advisors can often provide valuable perspectives on entity form.

Third, the optimal entity form frequently consists of multiple interrelated entities as opposed to a single organization. Multiple entities can be used to limit liability. For example, an entrepreneur may operate multiple "sister" entities in order to sequester relatively higher-risk operations (and potential legal claims) in one entity while protecting other segments of the business from liability. It may happen that the more-risky operations result in a legal judgment that exceeds the capital of the entity housing those operations. By virtue of the fact that the assets of the main business are held in separate entities, they would not be available to satisfy the judgment. This is true despite the fact that the related entities may share owners in common. It is increasingly common to see businesses organized into many LLCs under common control. The drawback of this strategy is that some jurisdictions impose an annual fee on each LLC, and each LLC also has an obligation to file informational tax returns, but these considerations may be an acceptable cost to achieve limited liability.

Multiple entities can also be used to gain tax advantages. This is possible in any situation where differences exist in the rate at which income from different entity forms is taxed. For example, in the United States, individual income is subject at the federal level to a progressive tax scheme. Income in the highest bracket is taxed at 37%, while income earned by corporations has been taxed at a flat rate of 21% since 2018. All else equal, owners of economic activities can reduce tax by legally shifting income to entities with lower tax rates. In essence, a lower tax rate on income leaves more net income for owners to enjoy. To be sure, every country has enacted laws that limit the most obvious kinds of tax arbitrage. Even so, a competent tax advisor can often help a business owner reduce taxes by taking advantage of the disparate tax rates of multiple entities.

Finally, the importance of the organizational documents cannot be overestimated. Entrepreneurs should choose a competent legal advisor who will seek input from the entrepreneur in the drafting process. All investors in the entity should sign the organizational documents, and an official copy of these documents must be filed with the jurisdiction in which the entity is established. LLCs should file a copy of the certificate of organization in all jurisdictions where they operate. In the United States, the proper authority for filing of organizational documents is the secretary of state.

Organizational documents are critically important in setting the rules by which an entity will operate. While the choice of entity establishes very broad rules, operating agreements fill in the gaps. In many situations, the organizational documents can establish alternative procedures if the default rules in prevailing law fail to meet the needs of the owners. It is critically important for entrepreneurs to understand and abide by the terms of the organizational documents in operating the entity.

One important function of the agreement is to set limits on the activities of the entity. Over time, an entity may drift into activities that are inconsistent with its original mission. If co-owners disagree about a new direction that the entity is taking, disputes may be resolved by referring to a description of the entity's purpose in the organizational documents. Agreements may also set limits on the ability of owners to operate separate businesses, either to focus owners' effort on the business at hand or to avoid competition or self-dealing.

## Conclusion

Every organization can benefit from a good fit between operations and entity form. Entrepreneurs should take a proactive role in deciding

which form will best support the growth of their business, both at the inception of business and, periodically afterward, taking into account the type of operations that are housed within the entity, future plans, and which parameters are most important for their organization.

# Comparative Administrative Culture

Jean Mercier
Department of political science,
Université Laval, Québec, Canada

## Synonyms

Culture and administration; Hermeneutics and administration; Isomorphism and administration; Population ecology and administration; The dynamics of governance

## Definitions

Governance: A first meaning of the term presents the word as an equivalent of "government," but it can also refer to a mode of administration different from traditional, hierarchic government, which uses more interactive and participative methods to achieve public sector goals. In new institutional economics, it refers to the choice economic actors make between hierarchy, contract, and market.

Hermeneutics: It refers to the art and methodology for understanding difficult or challenging texts in literature, religion, or the law. It was extended in social sciences and administration to include an avenue to understand challenging social or administrative elements under study.

Interpretive (or interpretative): In the spirit of interpretive sociology, it refers to the study of motives and world views, in the case of individuals and societies. When motives or world views are shared among different persons, the term "intersubjective" is used.

Isomorphism: The tendency for organisms, in competition for scarce resources and pressures for survival, to adopt similar structures. This tendency has been applied to organizations, under the population ecology movement.

New institutional economics (NIE): A branch of economics that studies institutions and more specifically the choice between hierarchy,

contract, and market, with the notion of "transaction costs," the costs of doing business with outside partners, as a key notion.

## Description

This chapter (this entry) describes briefly the manner in which comparative administrative culture was studied in the last four or five decades, starting with comparative public administration in developed and developing countries. It then compares classic public administration with the more recent notion of "governance" and explores the many dimensions of this now familiar term (governance). It then looks at two more recent lenses to study administrative systems and culture. The first is the biological notion of "isomorphism," the tendency for organisms, and indeed organizations, to resemble each other through time. The second draws from the tradition of hermeneutics to better understand the interpretive dimensions of comparative administrative culture.

In this entry in the Encyclopedia, we will first present an overview of the evolving trends and context of comparative administrative cultures. In a second part, we will look at some of the different disciplines used in comparative administrative culture. After looking at different disciplines, we will take a closer look at two relatively recent additions and lesser known disciplines which can add to the understanding of the question under study: first, isomorphism, on the one hand, and then hermeneutics, on the other hand. Each of these two methods represents opposing trends in the study of administrative cultures: isomorphism represents the tendency to draw on factors seen as more objective factors, traditionally represented by economics, and hermeneutics represents the more interpretative factors, traditionally represented by interpretative sociology.

In terms of content, over the last few decades, the topic of comparative administrative culture has seen many trends and change of focus.

At the outset, after World War II, the emphasis was on comparing the administrative cultures of developing countries and developed ones, in the hope (explicit or not) that there would be universal lessons that could be applied from the latter to the former.

After this initial trend, a series of other trends emerged.

Because of its tremendous economic growth, Japan and its own administrative culture became one of the favored subjects. Japan did indeed exhibit all the signs of a particular administrative culture. Only, this time, western countries were looking to receiving lessons, not so much giving them. It was an important change of focus.

With globalization processes all around us, the focus changed again. This time, and beginning in the 1990s, the comparison was not always between countries. Indeed, the comparisons shifted toward comparing classical administrative Weberian systems to other universal models, namely, the private model, and later still to what became known as the governance model. Governance has become a generic term, just like administration. But, for our part, here, we will treat it as a particular administrative formula, different from classical administration. The focus of these two models was, indeed, on presumably universal models, and not so much on national ones. Both the private model (and its application, privatization) and the governance model were often seen as applicable everywhere, regardless of local administrative traditions. Whether these models were truly universal concepts is another question, or course, and many saw in these proposals a lingering desire to impose western ideals to the rest of the world. Still, the explicit discourse was universal in tone and, to a large extent, in content, at least, at the outset.

With time, the private model, with its very prescriptive and sometimes implicit recommendations in favor of privatization of public sector activities, lost some intellectual appeal among students of administration, and, to a lesser extent, among administrators. The ideological content of these propositions became too obvious to propose its universal applications.

The second model that challenged the classical Weberian model was the concept and the ideas

related to "governance." The concept, which has many dimensions, has been around comparative administration for a few decades now, since the 1990s. Its intellectual appeal is greater than the previous model of privatization, because, essentially, it is less prescriptive, and, at least on the surface, less ideological. It is often presented analytically, even as a sign of the times, and not always as the right way of doing things. Yet, the prescriptive elements did not disappear completely, as we will see in describing the different dimensions of governance.

At the outset of the notion of governance, there was an international relations dimension. Indeed, in international relations, a classic Weberian model was often inapplicable, because of the voluntary, participative, and somewhat disorganized aspects to the field of study, not to mention its shaky and fragile bases. And so, participants, individual countries and international organizations, were led to negotiate and to advance their agendas in anything but hierarchic and ordered steps, which led to permanent negotiations and continued and lateral interactions. Some observers noticed that these types of permanent negotiations and interactions were also true at the internal, national level, especially in nations with a federal structure, a structure which is found in many important and significant nations, and also in the European Union.

With time, the model of governance migrated to the more general fields of political science, administrative studies, and public policy. It became, more and more clearly, an alternative to the classical model of administration. There were some prescriptive dimensions to this trend toward governance, but its analytical dimensions were not overwhelmed by them. Analytical work was done to evaluate how governance became a way of doing things administratively, how it was linked to larger patterns, such as globalization and the growth of information systems, and not so much as the proper way of doing things.

Seen in this light, that is to say in a more descriptive and analytical light, public administration and policy became interested in such topics as the use of policy instruments, and how governance type instruments such as flexible and interactive negotiation with participants and stakeholders, the adoption of internationally agreed upon norms and flexible light economic incentives appeared as alternatives to the one way, hierarchical tools of classic administration of policy implementation (Salamon 2002). This choice of tools, longtime seen as simple "administrative details" unworthy of sustained interest in political science or public policy studies, became later worthy of intellectual analysis. The choice of policy instruments became to a large extent the empirical terrain for the comparison between classical government patterns and emerging governance trends. The approach was not totally free, however, of prescriptive dimensions, as it was argued that the more recent and challenging administrative and public policy subjects, more particularly those related to environmental challenges and greenhouse gas reduction policies, were more in tune with governance policy instruments than with traditional hierarchic ones. Indeed, the large number of participants and stakeholders, tied together by a common goal but not by a strict hierarchy, seemed to be comparable, in many ways, to the unstructured and somewhat chaotic relations that players in the international field were already familiar with.

There is a third dimension to the idea of governance, and it comes from the field of new institutional economics. It would be inappropriate to distinguish here between traditional institutional economics and new institutional economics (NIE), but let us say that the vision of governance is, in this case, above all analytical and conceptual.

In the case of NIE, the term governance becomes a larger, generic term that includes different modes of organizing (Williamson 1975, 1983).

According to NIE, indeed, all human interaction of a productive or economic nature involves a choice of governance mode: either hierarchy, contract or market, or a mix between those three basic modes. Seen in this light, the choice of privatization, seen earlier, is but a choice in favor of those three modes, in fact a mix of market and contract. Governance, as seen by NIE, is not primarily prescriptive or ideological, since all three modes

have their advantages and limits. Indeed, hierarchy has its own advantages, and the other modes have their downsides, in the sense that when one goes outside its own hierarchic organization to produce a service or a good, he increases his "transaction costs," the cost of doing business with an entity which has its own interests and agenda and with which we have to organize the terms of the collaboration. These latter costs are reputed lesser when dealing with one's own hierarchy, since much of the terms of the collaboration have already been set. On the other hand, the outside entity one deals with, often more specialized, as in the case of a subcontractor, has its own economies of scale, which brings down its production costs. So, in a case where a public entity, say a government, decides to parcel out a public policy or public administration task, he must balance the increased transaction costs, a disadvantage, with the possible reduction in its production costs, an advantage. And so, to take an example from the privatization school, whether in the case of health or in road construction, the final decision is one that must be looked at case by case, empirically, with no clear decision obvious at the outset.

The final dimension of the governance notion we want to look at here, in a comparative manner, constitutes somewhat of a return to a prescriptive mode. It concerns the notion of governance as a series of procedures and processes that apply to both private and public entities. It is sometimes referred to as principles of "good governance." These principles aim at assuring that those who are entrusted with responsibilities that others have given them are held responsible for their actions. Those principles usually include accountability, transparency, and, more generally, the respect for open organizational processes. They are applicable, as we stated earlier, to both private and public entities. They are prescriptive in the sense that they aim at presenting and prescribing the right way of doing things. They are very present in the conditions that organizations such as the World Bank and the International Monetary Fund impose on countries or organizations that receive international aid. Because in many cases, the organizations imposing the conditions take western countries as an implicit model, "good governance" is not always immune to some form of cultural imposition. And good governance also may take an ideological dimension when it assumes that privatization of public entities is required to improving efficiency, effectiveness, accountability, and the respect for open processes. In essence, there is a possible throwback to the prescriptive and the imposition of western values, in this particular approach to governance.

Let us now turn to the use of different disciplines and approaches to compare the study of administrative cultures.

Let us first state that we will not be looking only at a given country's overall administrative patterns. In a given national setting, there are indeed other avenues to explore, both larger and smaller, than the national government itself. Indeed, there are administrative cultures in different organizations in the same countries, even in the same government. To take a current example, there are different organizational cultures in a ministry devoted to natural resources in comparison to a ministry devoted to environmental policies and the reduction of greenhouse gases. So much so that, according to some observers, an environmental policy dominated by a natural resources ministry will give little results in terms of environmental protection, as its organizational goals and administrative culture, beyond its official title, are fundamentally to increase production from natural resources, and not primarily environmental protection. In this view, basic organizational goals permeate all of the organizational culture, with very concrete and real effects.

Let us now return to the disciplines and intellectual traditions to better understand these particularities. We will conclude on two possible disciplinary avenues to explain and understand administrative entities: isomorphism, on the one hand, and hermeneutics, on the other.

Let us also point out to the fact that we are not only looking here at administration per say but also at comparative public policies. Indeed, as the world becomes smaller, becoming a global village so to speak, there are comparisons as to why and how different entities seem to differ as to tools and levels of success in different policy

challenges. Taking the larger view, let us look at some examples.

Europe, and Western Europe in particular, has had more success than North America on greenhouse gas reduction policies. How are these successes related to a specific European policy and administrative culture?

Much has been written concerning the "American exception." In a comparative perspective, the expression does not refer to a superior or inferior administrative system, but to a tradition different from other democracies.

To answer these policy and administrative questions, a large array of disciplines have been called upon, from organizational theory to anthropology. Disciplines looking at the "larger picture" appeared often useful in these tasks. Some of these disciplines have focused on subjective or intersubjective elements, as opposed to more objective ones. These include, among others, anthropology, sociology, and even history.

Even within sociology, there are several avenues to better understand the particularities of administrative systems: among those avenues to better understand administrative cultures, let us mention the historical school approach, the ideational approach, and the institutional approach. These different sociological approaches are different, but they can also be combined. Indeed, an administrative system can exhibit institutional particularities, based on some founding ideas, themselves related to their particular historical experience.

Let us now turn to different disciplines to understand administrative cultures. There is a change in focus here in the sense that, much like economics, the goal is explaining phenomena through the application of objective, universal concepts, and not subjective ones. Let us take the example of the tendency for some type of organization in the same field, everywhere in the world, to become similar in structure. That is counter to the tradition of looking, in comparative administrative culture, at differences, not similarities. But that may be a growing focus, as the world becomes, as suggested earlier, a global village.

In a nutshell, there now is the study of how, with time, administrative systems become, in many respects, similar. To explain this latter trend, notions coming from the natural sciences, such as population ecology, have been called upon to explain the tendency for many organizations and administrative systems all around the world to become more and more similar in structure. For example, universities across the world are adopting more and more similar administrative structures, with different faculties looking at different contents, and a central administration entity for services and support. This basic administrative mode has many variants, but on the whole, there is a move toward a certain standardization of university administrations. It draws from American universities, which themselves have drawn historically from German universities.

Now let us look at our next subject, a relatively recent addition to the explanations of such administration phenomena (of growing resemblances), a tradition more related to the search of objective factors. Indeed, the trend toward common patterns has a theoretical base, coming from the natural sciences, and it is referred to process of "isomorphism." It is, in natural sciences, the tendency for organizations in competition for common resources to resemble each other with time. The explanation, in the natural sciences, is that, with time, there is a structure that becomes optimal in a competitive environment and those organisms that survive will adopt those structures to augment their chances of surviving. In social and administrative studies, the trend toward similar structures, isomorphism, can be explained differently, and, indeed, different explanations were offered (Hannan and Freeman 1989). Essentially, isomorphism was often explained differently for private and public organization. In private organization, the explanation was more in tune with the explanation from the natural sciences, namely, the need and the will to survive. For example, if some businesses adopted a multidivisional structure, in the middle of the twentieth century, it was because of competitive pressures from those business organizations that already adopted these

structures with positive results. Let us keep in mind here that what is looked at here is the administrative structure itself, and not so much what the organization does in terms of product or services. It would concern more on how there are trends on how to organize certain public sector tasks than on what the resulting structures choose to do with them.

Drawing now from the search for objective factors in sociology itself, the fundamental dynamics for isomorphism in the public sphere are different, in sociology, from the explanations given for isomorphism in the private sector. Indeed, the notion of "institutional isomorphism" was offered as the dynamics behind the tendency to adopt similar structures in the public sectors around the globe. In some cases the reasons appeared less clearly rational. In particular, the prestige of the organizations that were imitated seemed to be an important justification, even if only unconsciously. Others included coercion, as when funding organizations impose structural conditions, such as privatization, to the receiving of funds. Even considering these semi-rational dynamics, the explanations were still more objective than interpretative sociology.

If the relatively recent trend of utilizing the natural sciences, namely, isomorphism, to understand the dynamics of administrative trends, our next subject, the use of the hermeneutic method, is going in the opposite direction, namely, in the direction of the interpretative dimension of the study of administrative cultures. Indeed, hermeneutics is somewhat related to the trends we described earlier in sociology, more specifically those involved in understanding interpretatively administrative and policy elements in the public sphere.

The question becomes then: What does the hermeneutic method add to our understanding of administration and policy?

The reason we will give here is that some of the most important administrative and policy challenges of our times, and the social dynamics behind them, are intriguing and not entirely clear and thus require interpretative understanding. These challenges are also those that seem intractable (Lejano and Leong 2012). There are many such intractable challenges. They range from the global incapacity to deal with the reduction of greenhouse gases, the difficulties in dealing with government corruption in the developing world, or then again, in the national sphere, the challenges of dealing with better gun control in the United States and to the difficulties in achieving real decentralization in France (Mercier 1994). There may be rational explanations to these challenges, notably the presence of economic interests, yet their persistence calls for additional interpretation and understanding.

Hermeneutics is an approach that aims at understanding when what is before us is challenging, intriguing, and difficult to understand. It has a long tradition in making clearer difficult to understand texts, religious, or legal texts. Its method has then been applied to "text like" human production, to art, to architecture, and to all human creations, under the leadership of French hermeneutic philosopher Paul Ricoeur. We can include administrative systems and policies under what can be analyzed with the help of hermeneutics, especially when the goal is to understand what has proven to be intractable and not satisfactorily understood.

There are internal controversies within the hermeneutic school of thought as to whether the hermeneutic approach is a true method or only a general outlook that cannot be reduced to methods and prescriptions. Among the former group, let us call this the methodological hermeneutics school; there are a few prescriptions which can be applied to, among other human creations, administrative cultures.

The first is that, in understanding a phenomenon, an administrative phenomenon, for example, there is always, in practice, a pre-understanding. The analyst himself/herself cannot but use all him- or herself in looking at a phenomenon, he/she is immersed in a historic reality that cannot disappear, it is there, and it even can be used to understand the situation more fully, more completely. Indeed, we do not look at the phenomenon under

study with a completely clean slate. We all have our subjectivity, and it cannot just disappear, but we can learn to use it and deal with it. In studying administrative corruption in developing countries, for example, my pre-understanding can be based in economics: I can, for example, even before analyzing the phenomenon, have a pre-understanding that the fundamental reason for corruption is caused by objective economic factors such as poverty. In another pre-understanding of the same phenomenon, another analyst will start with the sociological pre-understanding that the basic reason is the difficulty for bureaucrats to consider larger, impersonal entities beyond family, ethnic group, or tribe in societies where the latter entities are still the basis for social interaction. What is important is not that there are no pre-understanding, there will always be, it is that we are conscious of its presence and that we are ready to discard it if, in studying the phenomenon, the pre-understanding proves to be unfounded.

A second prescription is related to what is called the relation that should exist between the parts and the whole of what is looked at. Indeed, when looking at a difficult to understand phenomenon, there is a back and forth dynamic between the individual elements under study and the overall understanding of it. The parts help us to understand the larger phenomenon, and the larger phenomenon helps us understand the parts. A satisfactory understanding must, after this back and forth movement, be able to relate the two. At the end of the process, the understanding must have a certain unity, a common thread, an overriding explanation to understand its individual elements. If none is found, and the understanding is a series of unrelated elements, then the hermeneutic method may not add to the understanding of the phenomenon under study.

A third prescription is to the effect that true understanding can be undermined by opinion. If it is true that all understanding is related to a pre-understanding, this pre-understanding must not be strongly related to strong convictions, personal convictions, such as moral stances. In studying corruption, for example, we must not treat the phenomenon with a strong moral disapproval, because this moral stance can reduce our chances of really understanding it.

In conclusion, in studying comparative administrative cultures, there has often been a pull, a certain tension between explanation and understanding. Economics is often related to explanation, as it does not address the subjectivity of those under study. Sociology, and more specifically, interpretative sociology, inspired by Max Weber, sought to understand the phenomenon under study taking into account human subjectivity, sometimes referred to as "intersubjectivity."

In looking, here, at isomorphism and hermeneutics, we have looked at approaches representing each of the two basic orientations of comparative administrative culture, isomorphism representing the tendency to explain by universal and objective elements and hermeneutics representing the tendency to understand through more subjective and intersubjective elements.

The study of comparative administrative cultures will continue to oscillate between these two polar points, and, hopefully, both will contribute to our continued understanding of the objects of our study, comparative administrative phenomena.

# Comparative Administrative Cultures Between Developed and Developing Countries

Murat Onder and Israel Nyaburi Nyadera
Department of Political Science & Public Administration, Ankara Yildirim Beyazit University, Ankara, Turkey

## Synonyms

Administrative culture; Bureaucracy; Developed countries; Developing countries; Public administration

## Definition

To examine the features of administrative cultures in developed and developing countries with emphasis on the similarities and differences.

## Introduction

In social sciences, most concepts have different meanings to different people or fields. Public administration in any country, region, or continent across the world reflects, among other things, the unique sociocultural, economic, historical, and political experiences the particular entity had over time (Dwivedi 2005: 19–21). In addition, the level of fragmentation, development, and globalization also affects the nature of administrative culture. Past traditions and myths especially those with direct influence on one's psychology have a significant influence on the characteristics of practices in the public sector. Hofstede (1986, 308) defines culture as "the collective programming of the mind which distinguishes one group of people from another." Equally, the term "administrative culture" can be and has been interpreted in different views. Jreisat (2009: 37–9) defines administrative culture as "norms and values that shape and influence bureaucratic attitude, interpersonal relationship, and performance." Pečarić (2011: 385) defines administrative culture as "as a set of individual reflections of all the individuals, which in a specific working relationship with public duties and powers reflect their personal characteristics." In other words, it refers to the analysis, perceptions, and interpretation of bureaucrats' behavior. The analysis of these behaviors can be done internally, for example, by examining how public servants interact among themselves or with their superiors as well as internal organizational units on the one hand. On the other hand, it can be done externally, mainly by examining the nature of politics, other public and private organizations, the media, character, and beliefs of the citizens among other factors. Administrative culture thus represents a set of public interests as it seeks to represent both the collective interest of people and personal attitudes and behavior. In addition, given that culture is a reflection of people's interaction within a society, the sum interest adds value and uniqueness to how public administration is practiced and studied since it reflects the peoples' beliefs, character, history, and status.

Public administration as a discipline and profession has continued to play an important role in various spheres in our societies. Between 1940 and 1970, the public sector was held with high esteem; however, when several countries began to experience the impact of the 1980 global economic crisis, businesspersons and politicians put the blame on the bureaucracy with specific attacks on the bloated bureaucracy. At this time, private sector management techniques, skills, and practices were considered as the possible solution to the ills the public sector was facing, known as New Public Management era that was adopted in many developed countries and later spread to other parts of the world (Ayhan and Önder 2017). The New Public Management set the stage for the transformation of administrative culture in many countries by blending their national cultures and administrative cultures. However, not all countries adopted the new

culture in the same level and ways, and to date, various countries have different administrative cultures because of this complex process of blending dominant global demands and local cultural elements.

Comparative public administration is getting significant among practitioners and policy-makers (Chandler 2014; Farazmand 2001). Initially, the emphasis on public administration case studies was concentrated in developed countries. However, as more countries started gaining independence, scholars, donor agencies, and governments have begun to develop significant interest in the nature of administrative culture, most of which were different from the ones in the "West." Over time, the importance of including case studies from developing countries in comparative politics and public administration grew tremendously. Indeed, during and after the struggle for independence, many nations had hoped for prosperity and development which led to demands for better living standards. The actor of choice in the development process became the state which was tasked with initiating, coordinating, and implementing the development plans. Many governments from the new states embarked on efforts to search for administrative structures and systems that would effectively ensure their development goals.

The efforts to restructure their administrative systems were characterized by copying the structures and administrative models from developed countries. However, the application of these new systems had disastrous results in part because their implementation did not take into account the unique cultural aspects that public administration in developed countries was embedded (Onder and Nyadera 2019; Aykaç and Altunok 2018). Noteworthy, with increasing globalization, countries are interacting more often irrespective of their administrative, military, cultural political, economic, religious, and intellectual differences. Despite what others would describe as a clash in civilization as a result of these encounters, it is useful to note that the same has enabled both sides to learn and share ideas, experiences, as well as administrative culture. This explains the manifestation of various hybrid administrative models which represent different sets of culture from different societies across the world.

This section, therefore, seeks to highlight some of the resemblances and variances among developed and developing countries' administrative culture. It argues that despite the differences in applications, there are some similar trends that characterize public administration in developed and developing countries.

## Comparative Administrative Cultures

The distinction between developed and developing countries has over the years been pegged on the sociopolitical, economic, and industrial development (Kuhlmann and Wollmann 2014). Developed countries include a set of countries consisting of but not limited to Canada, Western European countries, Japan, and the United States. Heady (2001) adds to this list China, South Korea, and Russia being in the "second tier" of the development process. For a variety of reasons, developed countries enjoy higher overall standards of living than most others. Their citizens generally have higher levels of income, better health care, higher literacy rate, and equal protection under the law (Jreisat 2010). Developing countries are characterized by low living standards, less democratic, low literacy levels, high unemployment, as well as weak institutions. This section examines some of the salient features that characterize the administrative culture of developed and developing countries.

### Developed Countries

The success of most developed countries is pegged on an effective, innovative, and efficient administrative system characterized by among other things the ability to formulate and implement short-, medium-, and long-term development and strategic plans (Nyadera 2017: 23). The bureaucracy, in particular, is flexible and functional. There are few instances of ready susceptibility to interventions or personal pressure for one to perform their duties. Majority of public officers are preoccupied with propriety and correctness in dispensing their duties (Gullien 1994).

The indifference unto feelings or convenience of individuals, as well as excessive self-importance that characterize administrative systems in developing countries, is very minimal in developed countries. In addition, obsession with the inflexible and obligatory authority of precedents, departmental decisions, arrangements, or forms is less adhered to compared to other jurisdictions.

Rationalism more than secularism is equally an important cultural distinction of most developed countries. This facilitates the security and peace of minority groups. Secularism ensures that there is no favoritism based on identity or religious belief when it comes to the provision of public services. It also means that there are no obstacles for people of minority belief or orientation when it comes to joining the bureaucracy.

Democratic and inclusive culture is another common feature in developed countries. There is a significant relationship between democratic or authoritarian trends at the national/executive level and the behavior of public officers. Since most top administrators are recruited based on merit, it tends to be a mutual relationship between high- and lower-ranking public servants. This critical aspect may be taken for granted, but its significance toward teamwork and efficient operations in an organization cannot be ignored. For example, in developing countries, due to political appointment, many high-ranking public servants develop a feeling of being untouchable and arrogance which derails good relations with the low-ranking administrator. Decision-making is highly inclusive, therefore making the resultant policies a clear reflection of the public opinion. Public participation in policy-making is much higher than in less developed countries. This is supported by transparency in revenues, expenditure, and implementation of policies as well as the decision-making process. Transparency results in higher trust levels between the people and the government.

Low uncertainty avoidance can be seen in many developed administrative structures. This means that the culture is characterized by low dependence on the set rules and a higher probability of risk-taking (Franke, Hofstede, & Bond, 1991). There is more comfort with entrepreneurship and ambiguity and intrinsic motivation as a result of meaningful and interesting work that gives public officers room for creativity and growth is much higher than in developed countries. Individuals who opt to work in the public sector are aware of and highly motivated by the rewards that come forthwith.

Developed countries also enjoy more decentralization of power and resources among various levels of the administrative structure. This comes with obvious benefits such as quick decision-making given the reduced red tapes that would occur if consultation needs to be done higher up the bureaucratic ladder. In addition, given the increased level of responsibility each public officer has bestowed on them, they tend to be highly motivated in their work as they have a feeling that their efforts will contribute directly to the people. Quicker decision-making means that more things or work can be done within a shorter period as opposed to stagnation as one is waiting for approvals. More resources devolved to lower levels of the administrative structure also lead to efficiency and ease in addressing pertinent issues that are affecting people at the grassroots.

Masculinity vs. femininity (Hofstede 1991) has been an important topic of debate over the years. The question of equal pay, equal employment opportunities, or some tasks being reserved for certain gender has informed the culture of many administrative systems. Critically, women have often paid a bigger price in the process, and their plight has indeed been raised by activists and scholars globally. Developed administrative systems have been able to make the necessary adjustments, and today it is very common to find women and men doing similar tasks, getting equal pay, and competing equally for available opportunities. This culture is reflected in the recruitment and promotion of public officers.

There is the use of modern and advanced systems in administration. Most administrative systems in developed countries benefit from the use of efficient and modern technology in carrying out operations. These advanced systems help promote better information flow within the organization, comprehensive planning, record keeping, better coordination, and ease of supervision. Platforms such as e-government have not only improved

service delivery but also led to reduced costs and time needed to get service. On the other hand, developing countries face outmoded methods and systems of administration. Corruption is easily curtailed by the adoption of these advanced technologies.

Power distance in developed countries is lower than in developing countries. Power distance refers to the interaction between junior and superior officers in an organization (Hofstede 1991). Low power distance implies that while there is strong respect for hierarchy and superiority, low-ranking officers can challenge the decisions of their superior on legitimate and reasonable grounds. Public officers at all levels are involved in participatory leadership, and low-ranking officer depends less on superiors. In addition, if the superior wants a junior officer to enforce illegality or engage in activities that contravene the law, there is likelihood that such a decision will be challenged.

### Developing Countries

Public administration among developing and less developed countries continues to face serious challenges when it comes to fulfilling their duties in providing public services. Indeed, despite the hyped negative image these entities attract, it is important to note that various governments have often embarked on reforms to try and overcome the challenges experienced within the public administration system but with little results. This paper argues that these failures need to be extensively examined and that means looking at the administrative culture of developing countries.

Heady (2001: 299–302) points out a number of common traits that can be associated with a developing country's administrative system and structure. One of the most challenging issues is that bureaucracies in developing countries are less result-oriented. This, in turn, has serious ramifications on the performance and efficiency of public institutions in developing countries. In most cases, public entities in developing countries tend to focus on achieving goals and in the process give little emphasis on the means of achieving program objectives. The consequence of this is that in the short term, minor success can be achieved on smaller goals, while long-term initiatives tend to be negatively affected. This explains why long-term-oriented planning strategies are hardly achieved since performance is undermined due to a lack of sufficient measures that can promote result-oriented management culture.

According to Riggs (1964: 14–18, 28–33), administrative systems in developing countries are faced by heterogeneous and overlapping features caused by the presence and deep-rooted remnants of historical economic, political, religious, and social elements. As a result, an illusion that the new administrative structures are autonomously coined around modern systems of administration is often created. Thus, interpreting the administrative culture of these societies will require a deeper understanding of the overlaying interrelationship between ancient cultural practices and efforts to implements modern administrative systems.

Another characteristic facing most developing countries is the absence or limited use of strategic and development plans. The culture of planning ahead of implementing policies and development projects is an important feature in many developed countries, and this is credited for much of their success. Short-, medium-, and long-term plans are supposed to guide the bureaucracy on the direction the country is supposed to go. It helps reflect on the past situations, current status, and future prospects of the society. Indeed, one can observe that developing economies tend to allocate very little time, resources, as well as manpower to develop and ensure smooth implementation of strategic and development plans. Ironically, even among the few countries that adopt development plans, most of the time the plans themselves are heavily borrowed from other countries. In addition, once these plans are launched, they are not strictly followed or adhered to during the implementation process. The consequence of adopting administrative models from other countries has resulted in disastrous outcomes due to the incompatibility of some of the policies with the local situation. Seemingly, policy-makers tend to ignore some noneconomic or administrative factors that enable certain systems to work within a particular society. For

example, little attention is given to the historical, religious, and cultural beliefs, leadership quality, and financial and technical support from external actors that play a crucial role in shaping the administrative culture of a given country.

The level of corruption among developing countries has become deep-rooted within the administrative system that most bureaucracies have become synonymous with corruption. Described as a culture of corruption, public sector entities such as the executive and the judiciary and their various departments lead in most national corruption index in developing countries. Corruption disrupts formal and legal trends of public administration, and it facilitates impunity, loss of public funds, and lack of merit. This further worsens the failure to implement effective development and administrative principles in these countries.

Inadequate skilled personnel to either develop, implement, or monitor policies is another salient feature developing countries tend to experience more often. Limited skills among public officials remains a big hindrance to reform efforts more so if the new strategies are complex. Related to the above, sometimes the resolve to import policies and development plans is as a result of deficiency of skilled personnel who can develop the policies locally. This is ironical given the fact that there are very high levels of unemployment in developing countries, yet recent years have seen increased numbers of educated people in these societies. Sometimes this shortage is artificially created by the loopholes in the recruitment processes in developing countries which do not emphasize on merit. Nepotism, political patronage, ethnicity, and corruption are some of the main causes of this problem.

Overstaffing and low output are an important characteristic of administration in developing countries. This goes hand in hand with the concept of "free riders" most of whom are supporters of the ruling party who threaten to shift their political support elsewhere if they are not "rewarded." The government, therefore, turns the public sector as a place to absorb their supporters irrespective of their qualification or necessity to have such people working. The resulting huge wage bill means that the same employees lack proper motivation due to low and delayed payment of wages leading to constant strikes. The political implication of getting rid of the labor-intensive method of production and introducing the capital-intensive means, that is, the adoption of technology, whose advantage is efficiency and higher output, will not be realized. It will or should be remembered that an important feature of the now less popular structural adjustment programs pushed for by the World Bank and IMF to developing countries was the necessity to have a lean workforce in the public sector that would be efficient and reduce the wage bill. Insufficient and/or inappropriate working facilities continue to affect the output of public administrators in developing countries (Jreisat 1997, 2012: 29)

Political interference is equally very high within the administrative system of developing countries. Lack of independent institutions means that there is a lack of a consistent culture or standard operating procedure. Political elites will often interfere with decision-making, appointments, and promotion, funding to independent institutions, as well as the structure of these entities. Most often this leads to high turnover, especially of middle- and high-ranking administrators. The impact of this is that these organizations lose institutional memory due to frequent changes in management; at the same time, career administrators would choose to work for private sector rather than the government in order to have job security.

## Conclusion

This section has examined mostly the different characteristics of administrative culture between developed and developing countries. It emphasizes that while much of the discussion has been centered on the unique differences, there are many similarities that developed and developing countries share. Partly this is attributed to the impact of globalization on the administrative cultures of various societies. In addition, even the differences mentioned continue to reduce as countries, especially in the developing world, are restructuring

their administrative systems in order to improve service delivery. The adoption of New Public Management, as well as Good Governance practices, by developing countries is helping to reshape their administrative culture. Challenges such as corruption, overcentralization, and nepotism are increasingly being fought, and although most developing countries are still lagging in this dimension, there are good signs in the long run. Of importance, however, is that culture continues to play a crucial role in determining the success and failures of various administrative entities. Therefore, stakeholders should continuously review the existing practices to ensure only those that are in line with effective and efficient public service delivery are retained.

Decentralization; Downsizing public bodies; Innovation; Institutional reform; Modernization; Rationalization; Structural adjustment; The management of change

## Definition

Administrative reform is a political and administrative process that is carried out to improve or reorganize public sector organizations. The scope of administrative reforms varies from efforts to launch comprehensive policy change with the goal of accomplishing broader policy objectives, to the introduction of minor technical regulations that maintain public authority and the organizational capacities of a well-functioning state. Ideas underlying current public administrative reforms address the needs of state actors to resolve problems, such as economic crises, bureaucratic inefficiency, or lack of control. The importance of public administrative reform is obvious from the fact that state effectiveness is an important condition of state survival.

## Introduction

Administrative reform is one of the most dynamic aspects of modern state, as it deals with the core public sector, the administrative side of the government, and public management. Administrative reform encompasses measures to reorganize the structure of executive bodies, their principles of operation, and the ways in which they interact with other actors (organizations and citizens). The success of administrative reform largely depends upon the will of the key national players to properly manage policy implementation process. Issues of policy content, timing, and implementation strategies are equally important.

Samuel Huntington (1968) in *Political Order in Changing Societies* outlines the importance of institutionalization and its meaning for social change. The presence of political institutions, in his point of view, is justified by the fact that institutions give "substance to public interests," and as such, help distinguish politically developed societies from underdeveloped ones (28). This observation speaks directly to the study of administrative reform process.

The development of reform ideas underlying modern administrative reform discourse took place in line with global political developments observed throughout the history of decolonization. The starting point of modern stage of administrative reform, as such, goes back to the collapse of European and non-European empires, their centralized structures and regimes. The proliferation of ideas about administrative reforms was further triggered by the collapse of authoritarian systems during the second half of the twentieth century and the development of reform ideas, which emphasized the importance of institutional modernization.

Since the early 1960s, public administrative reform has been widely accepted as a means of bringing about change in state organizations. Accordingly, a variety of factors triggering change in institutional, ideational, and cultural arenas have been identified. Caiden (1969), for example, defined public administrative reform (PAR) as political struggle accompanied by the "artificial inducement of administrative transformation against resistance" (Caiden 1969, 65). The role of ideas, power, authority, and influence in implementing policy change and in changing the *goals, structures*, *and procedures* of modern democracies were strongly emphasized (see, for example, Lee and Samonte 1970). Finally, a number of studies elaborated on the so-called "moral content" of public administrative reform that seeks to maintain or create a superior model of bureaucratic organization by removing the historical institutional flaws in it. ("Moral" content refers, mainly, to the process of decolonization.)

Today, various experts suggest that public sector reforms are driven by diverging reasons, and the term "administrative reform" is used as an umbrella notion for the process of complex transformation involving a multitude of ideational, institutional, and interest-based processes. Administrative reform is generally understood as process, which is politically bound, meaning that administrative reform is **"power politics in action"** containing such features **as "ideological rationalization, fights for control of areas, services, and people, political participants and institutions**. . ." (Caiden 1969, 9).

The reasons to reform national and subnational systems of public administration worldwide include ideological, technical, and political considerations. The first of this is ideology, or value change process accompanied by the change of elites or their reorientation toward the establishment of new rules and administrative procedures. A second category of reason for reform is political. In this case, administrative reforms accompany steps taken by the top-level political actors to realign formal and informal power alliances among the actors and stakeholders engaged in a symbolic relationship with one another. Finally, the third set of reasons for administrative reforms is technical. It encompasses a wide range of incremental measures aiming to improve bureaucratic performance mechanisms and therefore adjust to the changing environmental conditions. The substance and the meaning of public administration and civil service reforms vary, despite the observed trend toward convergence of policy ideas and instruments.

## Sources of Change

Historically, all efforts to modernize state bureaucracy and state institutions originated either at the top or at the bottom of society, depending on a political and social context (Peters 2008a). For example, American government reform that denounced the distribution of officials' positions as a result of spoils system (see Tenure of Office Acts 1820 and 1867, Pendleton Act of 1883, the Hatch Acts 1939 and 1940, and CSRA 1978) originated in public dissatisfaction with the government (bottom-up process). By contrast, in Europe, relevant institutional changes came about as a result of global pressures, such as the dissolution of imperial institutional structures throughout the first half of the twentieth century and the development of European Union institutions during the second half of the twentieth century.

The trend of change that occurred between the 1980s and 1990s in Western European countries has been guided by the ideas of New Public Management (NPM) approach directed toward a more flexible and more complex societal organization. Although reform programs varied across states, most of them applied a range of neo-liberal ideas to the reform of state institutions. Among major dimensions of New Public Management paradigm were efforts to minimize the size of government, outsource public services, improve performance management system, introduce budgeting mechanisms, etc.

Christensen and Lægreid (2011) identify two waves of NPM and post-NPM administrative reforms. The first wave started with the crisis of state authority and focused on structural devolution, market-based principles, and economic efficiency. The second wave, by contrast, included a greater focus on value-based management, central capacity, control, and coordination mechanisms.

The stages of new public management reform are closely associated with the shifts in democratic accountability patterns taking Western societies from "input" to "output" democracy (Peters 2008a). "Input" democracy, in Peters' (2008a) view, may be defined as a process accounting for participatory side of a well-functioning democratic state (elections and public engagement). By contrast, "output" democracy refers to the established connection between collective and individual actors and public bureaucracy (transparency, information, and service delivery). These concepts speak directly to the distinction of "input" and "output" legitimacy introduced by Scharpf (1999). "Input" legitimacy refers to a range of opportunities available to the public to access the decision-making stage of policy formulation. "Output" legitimacy justifies the existence of government based on the outcomes of policy process, such as "achieving the goals that citizens collectively care about" (Ibid., 19).

In recent years, there has been a growing influence of external pressures triggering nations to reform their public administration systems. For the most part, state modernization efforts in non-Western societies occurred within the framework of policy diffusion or policy transfer mechanisms.

Policy diffusion may be defined as a process that occurs when governments enact decisions similar to those enacted in other jurisdictions, or when governments' decisions influenced by prior

policy choices in such jurisdictions. This process describes a broad range of phenomena embracing policy learning, policy emulation, and policy transfer mechanisms.

The process of policy transfer, for example, involves the direct application of knowledge and policies from one political setting – past or present – to another settings due to the involvement of global actors. Policy learning, unlike policy transfer, builds on the "success stories" exemplified by the consequences of similar policies in various settings, normally driven by the national elites. Finally, policy emulation is an attempt to copy the symbolic, structural, and substantial characteristics of other policies regardless of their consequences due to inspiration or competition that happens "when units react to or anticipate one another in the attempt of attracting or retaining resources" (Gilardi 2016, 10).

The underlying logic of all policy efforts aiming to adopt knowledge from foreign experience relies on the idea that Western societies have already achieved the necessary level of development and accumulated the necessary pool of expertise that is ready to be transferred to other societies. This view, however, omits the idea that local institutional and cultural conditions create significant barriers to the reform across nations.

Manning and Parison (2003) assert that the reforms in the area of public administration, particularly, in a transitional context, have never been a self-evident priority. Therefore, the introduction of administrative reforms – both in Western and non-Western countries – occurred despite the variety of institutional and ideological constraints:

> Given the enormous difficulties entailed in shifting *vested interests*, there is no intrinsic reason why administrative reform should rank alongside structural reforms or social reforms as a priority for action. There is of course a growing recognition that institutions are more important for development, but it is not at all clear which institutions are the most crucial and there is very little evidence that the specific details of government structure and accountability arrangements affect growth. (Manning and Parison 2003, 12)

Frustration with the status quo and financial and political problems feature prominently among the reasons for the reform of national institutions. The list of reasons to conduct administrative reform has extended over time to include such issues as the lack of bureaucratic efficiency, unresponsive and unaccountable bureaucracies, the lack of sensitivity to changing human needs, and other common problems related to bureaucratic quality and performance.

In non-Western societies, the shift toward the New Public Management mechanisms has been accompanied by the crises of state authority, political and economic circumstances that varied across national boundaries. Therefore, the timeline of new public management reforms in Western and non-Western societies did not coincide. Central and East European countries engaged in extensive governmental reform as a part of Europeanization (or democratization) project that was partly triggered by the collapse of the Communist system. The failure of highly centralized states to resolve problems of collective action contributed to the development of public demand for massive administrative changes.

In a more recent literature on public sector reforms, attention has shifted from the descriptive analysis of NPM to the discussion of paradoxes associated with implementation of this strategy, the relationship between administrative reform and democracy, discontinuities and unintended effects of reforms (see, for example, Barzelay 2001; Politt and Bockaert 2004; Peters 2008a, b; Christensen and Lægreid 2011). Interestingly, nearly all of these studies have viewed civil service as a single (though essential) part of comprehensive administrative reform project, which covered the principles of formation and management of public bureaucracy. The scope of civil service reform is, however, broader because it is not confined to state executive.

Evidence provided by the aforementioned accounts suggests that the number of countries that managed to resolve their governance issues at once with the use of NPM mechanisms has been strikingly insignificant, although innovative and all-inclusive public policy changes were attempted nearly everywhere. A few policy dimensions, such as e-governance, appear to be more successful than others on a cross-national basis. Bureaucracy, in this respect, is nearly

always engaged in governments' efforts to shift the blame for some of the observed policy failures.

Lynn (2010) argues that the notion of convergence which describes the tendency on behalf of national reform leaders to adopt similar reform strategies, and programs involving similar terminology, is reinforced by the variety of actors, such as the OECD, the International Institute for Administrative Sciences, the International Public Management Network (IPMN), the UN and other global forces. What follows from this analysis is that the "choices of administrative arrangements may be a resultant of socialized choice taking within relevant organizational fields" (116).

The pool of actors involved depends on the following factors: political regime, the stage of development, institutional structure, and international political arrangements. All of these are "filters" of the domestic decision-making, which imply that national conditions do not necessarily suit some of the proposed policy changes.

On a theoretical level, recommendations devised by the World Bank, the European Union, and the United Nations make every single effort to merge the ideas of rationalization and modernization perspectives. In this context, recommendations originating in research on good governance follow the logic of new public management paradigm.

Recently, there has been a growing debate about the structure of public policies and the necessity to adjust such policies to preexisting institutional and cultural conditions. This trend in public discourse has been reinforced by evidence from case study analysis demonstrating that the adoption of wrong strategies may lead to suboptimal outcomes.

The meaning of public administration and civil service reforms varies from one country to another, despite the adoption of similar instruments and mechanisms. For some countries, government reform is all about structural change and innovation (among these cases are Western democracies and some developmental states, such as Singapore); for others, it is all about establishing greater control and subordination of civil servants to the top level political executive.

In Post-Communist societies, the challenge has been to change accountability mechanisms, provide a viable incentive structure, and train professionals in line with broader trends of institutional reform dynamics. For example, in the Czech Republic of the early 1990s, public administration reform was blended with the reform of territorial self-government and regional administration. Significant changes were not even attempted until the time of accession to the EU in 2004.

Starting from the early 2000s, the New Public Management discourse with its emphasis on effectiveness and efficiency prevailed in most CEE states, as well as in Russia. Research on the "state after communism" (see Nunberg 1999) has demonstrated that many public bureaucracies in postcommunist Europe appeared to be resistant to any kind of change, and even more so to the process of all-encompassing transformation. Problems associated with the reform commonly originated in the complexity of the required change, the lack of vision, and finally, the lack of policy-making expertise in the area of personnel management. Therefore, the range of questions embraced by the post-Communist administrative and civil service reform discourse covered profound and fundamental issues, such as the role of the state in economic development, as well as the process of microimplementation, which includes setting up the goals, strategies, activities, and contacts of the actors involved.

## The Difference Between Administrative Reforms and Civil Service Reforms

Public administration and civil service reforms represent separate, though closely related, policy domains. Administrative reform encompasses measures to reorganize and downsize the structure of executive bodies, including principles of operation and the ways in which they interact with one another, the citizenry, and with other organizations. Civil service reform, by contrast, focuses exclusively on issues concerned with the formation and management of the civil service (in all branches), including bureaucratic recruitment, training, pay and promotion, discipline, and

security of tenure (aimed at improving state administrative capacity and the quality of state service).

Historically, "administrative reform" and "civil service reform" have been used almost interchangeably. Quite recently, however, these notions were embraced by the so-called "good governance debate" which is used as an all-inclusive framework for making policy decisions more effective in terms of accountability and citizen participation. The notion of civil service reform has become closely intertwined with the process of political and economic decentralization. The reason for this is the influence of international development community promoting the idea of CSR as a part of reform package designed to bring about greater economic austerity to the financially unsustainable regions. For example, one of the United Nations publications (UNDP/MDGD 2001) argues that CSR contributes to "macroeconomic stabilization by restoring budgetary stability, strengthening revenue collection, managing aid, and improving development performance" (11). At the same time, CSR may contribute to the design and implementation of programs for social development, which is conditioned by the fact that both capacity of civil servants and their morale are significantly improved.

Internationally, CSR encompasses varied practices for setting up efficient systems of budgeting, service delivery, recruitment, promotion, payroll, and other aspects of an effective civil service. In many cases, these processes are closely intertwined with the national programs of economic reform.

The literature on Central and Eastern European transition suggests that the process of democratization has influenced the dynamics state-building efforts in relevant societies. It is observed, for example, that the process of democratization – specifically, the process of institutionalizing party competition prior to the consolidation of state bureaucracy – is likelier to result in a stable, politically neutral civil service (see, for example, Grzymala-Busse 2004). Thus, even though the actual linkage between various aspects of reform and the process of democratization is not fully explored, it is obvious already that the process of democratization may not only result from public sector reforms, but also serve as a precondition for transitioning to a new model of rational (modern) bureaucracy.

Generally, despite the fact that there is an obvious juxtaposition between bureaucracy and democratic governance, civil service reform may indeed be used as a method of value change influencing human behavior in a profound manner. First of all, modern instruments of CSR, such as participatory budgeting system, appear to be essential to promoting and sustaining pluralism in political life and ensuring the participation of citizens in public activities (Peters 2008a). Second, the lack of political neutrality and the increase and the pervasiveness of corruption among politicians and civil servants are all hindering the development of democracy in many countries.

Streamlining the incentive structure for civil servants promises to resolve issues of poor bureaucratic performance and motivation underlying such problems as poor quality of public goods. Thus, by establishing clear and transparent rules of the game for a great number of policy actors (political actors, individual bureaucrats, civil society, bureaucracy as a uniform entity, and others), including clear and effective mechanisms of law enforcement, such reforms can improve the chances of a well-functioning democracy to survive. Specifically, this process is supposed to connect the two varieties of democracy, i.e., "input" democracy, which is exercised through the election channel, and "output" democracy, which is built upon a direct connection between public officials and citizens (Peters 2008b).

A major challenge to CSR is devising an appropriate reform implementation strategy, as well as incentives to ensure that civil servants fulfill their responsibilities according to the newly established institutional constraints.

It is important to emphasize that comprehensive reform of governance systems requires commitment from political and administrative leaders, which is difficult to plan ahead of time. In this respect, policy-makers worldwide have recently advised in favor of incremental policy adaptations, suggesting they are less likely to be defeated by the lack of proper planning mechanisms and political or financial support at any point of time.

The UN policy analysis, for example, concluded that comprehensive strategies were "neither possible nor desirable" in a wide range of transitioning and developmental states, given the difficulties of agreeing on a reform package and then implementing its elements (UNDP/MDGD 2001). In this respect, the study suggested focusing on a set of realistic and popular issues that could generate both political and administrative support to the subsequent reform developments. "This issue package [which starts from popular measures] can then serve as a CSR 'entry point', simply because most policy issues are interrelated: performance relates to both capacity and motivation, which, in turn, relate to training and systemic environment. Once positive results are achieved in some functional areas, these can 'snowball' in reinforcing efforts in other [policy sectors]" (31).

It is important to mention that the difficulty of CSR implementation originates in the nature of policy field and resources involved in the process of reform implementation. First of all, CSR belongs to the range of policy issues that rarely appear on public policy agenda through the pressure of massive discontent. Second, CSR goes beyond institutional processes and structures, as it deals with human behavior, which is difficult to change in a short period of time.

One of the reasons, which make CSR particularly difficult, is that it belongs to the range of problems with the costs concentrated within the government, whereas effects of these reforms are not immediately visible. In case of CSR, the situation is particularly difficult because civil servants have a direct interest in maintaining status quo rather than achieving change. Some of the most obvious characteristics of this type of reform make it difficult to track or measure change process. This type of reform may therefore succeed whenever regime is stable, widely accepted, and insulated from the possibility of capture by entrenched interests.

## Conclusion

This entry has provided an overview of comparative administrative reforms, including the development of global discourse around the field of public administration. Administrative reform has been defined as a complex process aiming to achieve the goal of bureaucratic rationalization (or, in some cases, modernization) of state executive, political and institutional realignment in a context of regular or irregular change. The ideas underlying public administration discourse address the needs of state actors trying to find the right balance between the processes of political centralization and institutional decentralization. The importance of public administration reform is obvious from the fact that state effectiveness is an important condition of state survival. This reform may be described as a historical process aiming to maintain or modernize state institutions.

The meaning of public administration and civil service reforms varies from one country to another, despite the observed global trend toward policy convergence. For some countries, public administration reform is all about structural change and innovation; for others, it is all about establishing greater control and subordination of civil servants to the top level political executive.

The discussion of Western and non-Western patterns of bureaucratic reform confirms that state actors embrace ideas from global public administration discourse. However, the usefulness and applicability of such universal solutions is frequently questioned, whereas domestic political elites tailor the goals of the reform process to their own political needs. The crisis of state authority has now become a recurring theme of academic discussion. A viable solution to this crisis has not been found.

An important yet highly neglected feature of all research dealing with public administrative reforms concerns implications of such discussion for representative democracy and democratic theory. The literature on Central and Eastern European transition suggests that the process of democratization has always been closely intertwined with administrative and institutional change. Thus, even though the actual linkage between various aspects of administrative reform and the process of democratization is not fully explored, it is obvious that the process of

democratization and state formation are not mutually exclusive. The choice of values and institutions underlying public administration reform may reinforce the process of democratic consolidation leading toward the establishment of rational service-oriented bureaucracy. This process requires a long-term learning strategy aiming to overcome the tendency of national governments to use public administrative reforms instrumentally as a way to fill political gap rather than resolve policy-oriented issues.

## Definitions

Being a comparative study, this section of the entry tries to clarify the concept of comparative public administration as well as the generic term of public service reform. The rationale behind this conceptualization is twofold, firstly, to provide an operational clarity by removing all sorts of nuances and the analytical difficulties surrounding the key concepts, and secondly, the exercise of conceptual clarification in this entry tries to provide themes, framework of analysis, and methodological guide on how to infuse practical relevance to the study.

## Comparative Public Administration

The generic concept "comparative public administration" is not generally endorsed by all scholars as it has been conceptualized in different semantic connotation. According to the Comparative Administrative Group (CAG),"Comparative public administration is a theory of public administration applied to the diverse cultures and national settings and the body of factual data by which it can be examined and tested" (Kuhlmann and Wollmann 2014).

## Public Service Reform

The concept of public service reform means different things to different people. Caiden (1969) uses it to refer ". . . to all improvements in administration; to general administrative overhauls in difficult circumstances; to specific remedies for maladministration; to any suggestion for better government; and to intentions of self-styled administrative reformers. . .."

In this entry, public service reform is defined as "a systematic and integrated effort to bring about fundamental changes in public administration to enhance public administrative capability to achieve national development goals." This definition is designed to accommodate two important components which are the organizational improvements (both structural and procedural) and improvements in the behavior of civil servants.

## Introduction

Administration constitutes one of the most significant components of every political structure, in the sense that it plays a pivotal role in the conception, the pursuance, and the accomplishment of governmental wills and objectives. It has been argued that administrative system of every society is a manifestation of different ecological components existing in that society and it is the expression of both the sociocultural and political structures in such societies that gives shapes and meaning to the administrative system therein (Fitzpatrick et al. 2011). Scholars like George Orwell in his book *Shooting an Elephant* have provided a contextual explanation of how he has seen for all intents and purposes that the administrative system in various parts of the world performs distinctively in order to suit the environment or ecology they are set in.

Against the above background, this entry represents a modest attempt geared toward a comparative analysis of administrative reforms in Nigeria, Malaysia, the Philippines, and Brazil in their quest toward developing a more workable and market-driven public sector. The justification for this study is not far-fetched; this is because as observed by one of the forefathers of Public Administration Woodrow Wilson (1887) "so long as we know only ourselves, we know nothing." Thus, this entry tries to review the changes in administrative institutions, processes, and behaviors across organizational, national, and cultural boundaries. The entry compares attributes and performance of administrative systems and subsystems as well as individuals or groups in positions of decision-making to generate knowledge and enhance understanding of public management. It tries to recognize similarities and differences and underscores successful practices and, thus, tries to expand options and alternative strategies for improving the performance of public institutions (Kuhlmann and Wollmann 2014).

It is imperative to note that ecological factors such as legal norms, culture, politics, the state of the economy, and societal values all have considerable impact on public management, stimulating or stifling systemic traits and performance. Therefore, this entry seeks to discover the patterns and regularities of administrative action and behavior to produce new knowledge and insights and to affirm and refine existing information so that public administration scholars and practitioners could be better able to sort out and to adopt most worthy practices.

## Methodology and Approach

The entry adopts a qualitative comparative research method; it is therefore imperative to

note that there are five different approaches when it comes to comparative study: the inter-institutional approach which seeks to compare two or more administrative units within an organization, the intranational approach which is primarily concern with the comparative study of various administrative system within a particular country, the cross-national approach which is geared toward the comparison of two or more administrative systems or their parts in the settings of different nations, the cross-cultural approach which involves the analysis of administrative system involved in countries forming part of different "cultures," and the cross-temporal approach that has to do with comparison involving different time frames for analysis. To this end, this entry has adopted the combinations of two approaches in its analysis, that is, the cross-national and the cross-cultural approaches.

The rationale for selecting Malaysia, Brazil, and the Philippines as cases of comparisons is twofold; first while the Malaysian case depicted one of the examples of a homegrown experimentation, pragmatic, sustained, and incremental public service reform occurs concomitantly with the political, social, and economic changes thereby providing a clear-cut example of systematic evolution of effective public service. Secondly, the impact of the imposition of the martial law on the Philippine's civil service is similar to that posed by the prolong military rule in both Brazil and Nigeria which therefore provides a sound clue on how to achieve a sweeping reorganization of public service in order to bounce back after an era of great centralization.

## Theoretical Framework

This entry revolves around the Ecological Comparative Paradigm as a framework of analysis. The ecological paradigm in the study of public administration was pioneered by J.M. Gaus (1947), Robert A. Dahl (1947), and Roscoe Martin (1952); however, F.W. Riggs (1961) remains the foremost proponent of the ecological approach in public administration. The concept of ecology in its literal connotation relate with "environment" which incorporates physical, social, and cultural components. Along these lines, it is essential to focus on the connection between administration and environment (both internally and externally) and how they influence each other. Environment is the supersystem; the rest and others like political system, administrative system, and so forth are all subsystem who works under it. It impacts its subsystem and the other way around. They both need to acclimate to each other and furthermore reform and redesign each other now and again to remain up to date where the general public's desires drive the policies which eventually usher in development that inspires the socioeconomic status and environmental level for development to take place. So they are associated and not totally unrelated of each other.

The ecological worldview to public administration accentuates on developing nations and why there was a huge discrepancy among them while applying the Americanized models of public administration and how they adapted up. Its main proponent Riggs found that the primary explanation behind this discrepancy of administrative frameworks is essentially influence by the environmental condition that they are set in. Every nation had an alternate situational setting which assumed a noteworthy role in the molding of the administrative framework in light of the fact that without the assistance and endorsement of its citizens, a country's administrative system cannot survive, and in this manner, it acts as dictated by its environment, and thusly it also impacts the general public with its procedures and methods. In the Ecology of Public Administration (1961), Riggs relied on his field encounters in Southeast Asia and the United States in defining his point of view on public administration in developing nations.

Riggs perceived that the emerging nations have been confronted with the issue of revamping and adjusting their administrative system to accommodate and tackle the challenges accompanying their development prospects. The issue is that administrative ideas and systems developed with regard to social, economic, and political structures of Western nations are not completely

substantial or applicable in the new settings. In this way, Riggs inferred that distinctions in historical, social, cultural, or topographical situations influence the manner by which administration is constructed. He alludes to every one of these issues of the settings as the ecology of administration. Governmental setting is one of the basic determinants of administrative conduct, Riggs observed (1961: 4).

## Underpinning Theory

In his analysis, Riggs consistently emphasized that the comparative approach is indispensable. By comparing societies, we begin to discover whether any particular environmental feature is regularly accompanied by some administrative trait (1961: 3). Following Riggs (1961), we specifically compared numerous administration of developing countries that have important consequences for the administrative system. Thus, to explain the administrative reforms among the four administrative systems, we must look for ecological differences in order to identify how social, cultural, historical, or architectural environments affect the way in which administration is conducted in those four countries and what is there to learn from one another.

## A Comparative Review of Public Service Reforms in Malaysia, the Philippines, Brazil, and Nigeria

### The Malaysian Experience

The Malaysian public administration concentrated on furnishing administrative enhancements with the infusion of new outlook and thinking paradigm. To this end, it focused on internalizing seven foremost qualities in the public sector setting: quality, productivity, creativity, discipline, coordination, professionalism, and responsibility keeping in mind the end goal to build up a forward-looking, versatile, market-driven public administration in order to meet up with the challenges of rapid development (Xavier et al. 2016). Keeping in mind the end goal to accomplish these targets, the Malaysian government adopts the accompanying methodologies among others.

#### Structural Adjustment

Resulting from the report of the study conducted couple of years after independence by American advisors, the administration set up the Development Administration Unit under the Department of the Prime Minister to reorient the reasoning and operational style of the public sector and to serve as a catalyst for the introduction and assessment of reforms in the public sector. Public enterprises were established to supplement the weaknesses of the private sector.

An all-encompassing National Training Institute (INTAN) was established in 1972 to give short and long haul training for the whole country's public sector personnel. Abroad training for chosen key public officers was also conducted (Mohamed and Xavier 2016). In 1970, a far-reaching central personnel office was set up in the Public Service Department to authorize and execute labor administration strategies and activities to upgrade the efficiency and feasibility of the public administration. As necessities changed, another agency, the Malaysian Administrative and Manpower Planning Unit (MAMPU), was set up in 1977 under the Department of the Prime Minister to identify the genuine obstructions of administrative development at all levels and prescribe measures to address them. Fusing administrative and development changes for government employees, MAMPU keeps on paving the path for the modernization efforts in the public sector (Said et al. 2015).

#### Improved Productivity and Delivery of Services

As in Nigeria, the Malaysian public sector and regulatory structures set up in the 1970s were denounced for expanding bureaucratization, red-tapism, and wastefulness. Moderate economic advancement and a considerable deficit budget epitomized these inadequacies (Bianchi and Xavier 2017). The reform movement was therefore pursuit to upgrade the effectiveness of public servants; trimming the span of the public administration and measures to support these activities were equally presented which incorporates total

quality management, performance indicators, and citizen's charter. In 1987, MAMPU set up a Productivity and Quality Management Division, which came up with a program with four prime targets: to re-situate the public workers on the centrality of performance improvement and measurement; to give consultative and consultancy services to government offices on performance improvement and measurement; to coordinate studies on social and diverse aspect of the working environment that could impact efficiency; and to monitor and control productive improvement and measurement by government agencies (Bianchi and Xavier 2017).

The following strategies were instrumentals to the accomplishment of the performance improvement measures: top administration responsibility and support; a structure for overseeing efficiency change; the incorporation of all workers in these undertakings; and training and recognition. The public sector was similarly right size through privatization and the decrease of the civil service. In mid-1980, a staged privatization began selling different public ventures and reshuffling and blending offices and statutory bodies. Almost 150 public ventures were privatized, including aircrafts and shipping, the railroads, and power and communication administrations realizing a normal 10% of the public service, precisely 90,000 employees (Said et al. 2015).

### Making the Most of Staff

To improve the performance of individual public worker, the Malaysian government initiated different direct measures such as the non-discrimination in recruitment practices to improve enrollment and maintenance; a new performance appraisal system; a sweeping compensation package which carries performance incentive; the redesigning of staff training and development policies; and the revamping of public codes of conduct and rules. These measures fundamentally gave women equal opportunities for recruitment, selection, training, and development in the civil service. Additionally, 1% of all civil service positions were saved for the physically challenged people enrolled with the Ministry of National Unity and Social Development. The power of enrollment lies eventually with the Public Service Commission, a free body, which, in a joint effort with the pertinent executive offices, publicizes vacancies, conducts examinations, and meets and selects candidates for various posts. In any case, as of late, these powers have been assigned to heads of divisions in respect of the staff of chosen support service (Said et al. 2015).

### A New Public Service Code of Conduct

In order to make the public service more workable and result-oriented, the Malaysian government earmarked a new set of codes of conduct in 1993, the Public Officers Regulations. The new code was aimed at achieving the following vital targets: creation of exceptionally trained public servants who are capable and focused on their obligations; brilliance in work execution; efficiency and effectiveness in service delivery; and a clean public administration, free of any corrupt practices that could gouge its picture. The regulations stipulate an implicit rules and additionally disciplinary methods. Disciplinary actions can be taking against any government worker found to have committed the following misdemeanors: dishonesty to king, country, and government; setting self-enthusiasm over the public interest; conflict of self-interest with civil service commitments carrying on so as to bring the civil service into notoriety; being inefficient or lazy; being exploitative; being unreliable; passing on or attempting to pass on external influence upon the civil service, regardless of whether to advance one's own leverage or that of others; being defiant or acting in any capacity that may sensibly be deciphered as insubordination; being scheming; and being imprudent in the execution of one's obligations (Bianchi and Xavier 2017).

## The Philippine's Experience

### Nurturing Public Service Ethics

The civil service reform from the Philippine's parlance was anchored on the creation and evolution of sound civil service ethics and values, in the sense that the drive for good and honest governance, which is the permanent characteristic

of a bureaucracy having a world-class stature, involved not simply keeping the organizational structure, systems, and procedures in great running condition (Reside and Burns 2016). Much consideration ought to additionally be dedicated to developing the best possible values, norms, attitude, and work culture in the working environment. This is on the grounds that the internationalization of the right attitude and solid moral values serves as the strong bedrock for continuing administrative reforms. It ought to be noted, then again, that norms and morals are the essential products of environment, not of laws as usually opined. The best plan of action in this way is to adopt and execute mechanism which has the tendency to make a favorable and empowering environment that would inhale life to the desired moral values (Brillantes et al. 2018).

#### Inculcating Bureaucratic Excellence

Like the Nigerian public sector, the Philippine civil service has constantly experienced unfavorable public opinion. Among others, it has been seen and stereotyped as ineffective and besieged by mediocrity. One of the rationales behind such opinion was the impacts of political issues in the civil service especially in the area of human resource management. Concededly, merit criteria for recruitment and selection have to a great extent been ignored and aimlessly trampled upon to provide entry and promotion of political protégé (Brillantes and Fernandez-Carag 2016).

To address this squabbles, the CSC deemed it fit to send one resonating call to state workers across the nation that job performance is sine qua non of job security and that the constitutional assurance on tenurial security should not be a shield for ineptitude, incompetence, and inadequacy. Hence, merit and effectiveness of public servants should be the most important thing in the entire public organizations. One stage toward this direction is to guarantee that the positions in government workforce are occupied by people, who do not just have above-average qualification but whose aptitude, abilities, and skills are certainly beyond reasonable doubt (Brillantes and Perante-Calina 2018).

#### Empowering the Employees

Empowerment finishes the circle in the significant steps taken by the Civil Service Commission during the reform process. Unionism in government developed after the reclamation of democracy in 1996 to a great extent as an instrument for self-defense employees whose jobs were under threat due to the monstrous purge and government reorganization embarked by the new administration. In this way, the 1987 Philippine Constitution ensured government employees the right to self-organization and collective bargaining and fleshed out further by a presidential order (Brillantes and Perante-Calina 2018).

The Civil Service Commission, as the main agency responsible for human resources management of the Philippine government, plays an imperative role in breathing life to the self-empowerment principle, in the sense that Civil Service Commission has stepped up the evolution of dependable public sector unionism. Among others, it begins the act of giving award, with the coordinated effort of employee unions, the Gawad Kalinga or the Employee-Friendly Employer (Government Entity) Award to recognize those government agencies, which have showed bona fide sympathy toward the welfare of their rank and file staff (Brillantes and Perante-Calina 2018).

### The Brazil Experience

#### Transparency

The primary pattern in the Brazilian public service reforms rotates around the improvement of components of transparency, open government, and accountability. A critical evaluation of the public service reform strategies in Brazil demonstrates that half of the reform activities include these principles in the execution procedure. For this situation, the outcome strengthens the view that the Brazilian central government is reacting to public demand in directing and controlling government activities.

An emblematic instance of this pattern among Brazilian activities is the Transparency Portal of the Comptroller General of the Union (CGU) (2007) which provides an impetus for ensuring effectiveness in the monitoring of all financial

execution of all projects and activities of the government. Another mechanism is the Social Security Census: innovative solution for some of the squabbles in the operation of the registry (2007). This statistics made it conceivable to see ill-advised and excessive charges by the Social Security (INSS) and produced investment funds of almost 120 million Reais. The foundation of the Basic Education Development Index (IDEB) (2009) additionally falls into this class as it created greater responsibility for the education sector. Another critical winning activity is the e-SIC – Citizen Electronic Information System of the Comptroller General (2013) – that serves as a passage under the federal executive power, so any citizen may allude to the law on access to public information (Gomes and Secchi 2015).

### E-Governance

The advancement of e-government as a reform strategy to encourage citizens access to and participation in the public administration remains at 13% or 16% and is the most minimal among the patterns broke down. In this angle, the INSS: Scheduled Appointments Program produced significant diminishment of waiting times (2008); the Retirement Program within 30 min (2010); and the Program to the Application of Benefits (2011). The investigation of different reports features projects, for example, broadband internet in state-funded schools by the Ministry of Education (2010); the Network of Tele-assistance to remote regions which enhanced access to particular human services by the Hospital of the Federal University of Minas Gerais (2012); and the mail station turn around logistic of the Brazilian Post and Telegraph Company of 2014 (Melo 2017).

### Network Governance

Acting in network and partnership is seen to be the second most intermittent pattern. It is available in the vast majority of the activities (65%) affirming that co-creation is a vital factor in the detailing and execution of development in the public sector. Certain heterogeneity takes proceedings in the structure of the partnership among government agencies involved in half of the reforms activities which allows sharing of ideas and knowledge; this affirms the observation that the capacity to act together can create critical benefit for the state as well as the distinctive institutions and levels of government (Pinho and Sacramento 2015).

The private sector is an important partner as it is associated with about a quarter of the reform activities by playing the role of advisor or getting directly involved or indirectly with particular public policy. The effectiveness of the performance of the private sector in the network administration system recorded appeared to have increase with the evolution of new public policy frameworks. The participation of social agencies mirrors the proper role of the private sector in an innovative administrative process. The process that bridged the gap between the private and public sectors could be seen in the activities of social services, for example, the Ministry of Social Development and Hunger Alleviation, the Ministry of Health, and the Special Secretariat of the Presidency (Pinho and Sacramento 2015).

Two exceptionally innovative activities in regard to the network systems and partnership for the execution of public policy need be highlighted here. One is the School Route Program of the Ministry of Education (MEC). Granted first place in 2009, it is a partnership of offices of the central government (National Bank for Economic and Social Development), municipalities, various states, the federal district, and NGOs to tackle verifiable issues of transportation to and from the schools in provincial regions. The other activity is the Bolsa Família (Family Allowance) Program. Through the Bolsa, a follow-up of the conditions of the families has possessed the capacity to accomplish huge outcomes (the health agenda of 6.5 million families and the school record participation is of 14 million kids, and young people is monitored) because of the coordination of a perplexing network of government organizations, including ministries of health, education, and social service with all states and districts in the nation (Pinho and Sacramento 2015).

This pattern is convergent with the present administration of the digital age. Keeping in mind the end goal to outperform the competitive and divisive perspective of the NPM, the reform

proposes the expansion in the appropriation of information and communication technology activities as a way to enhance the connections between authoritative units and the general public. These advancements, driven by exponential advances in ICT in the course of the most recent decades, tend to enable governments to become more coordinated and responsive by accomplishing diverse objectives, for example, enhanced information preparing, better administration, improvement and monitoring of public policies, and increased transparency.

Two activities specifically fall into the ICT pattern and goals. The first is the utilization of personal digital assistant (PDA) by Brazilian Institute of Geography and Statistics (IBGE). During the national census, the IBGE gave data and communication in real time in excess of 80,000 enumerators spread crosswise over Brazil. The second activity is the Electronic System of Citizen Information Services (e-SIC), by the CGU, which encourages speedy process thereby decreasing bureaucratization in the submission and processing of the request for the Access to Information Act (LAI). The move to online administrations empowered e-Sic to process in excess of 220,000 applications with a reaction rate of 98% and normal time of 14 days (Gomes and Secchi 2015).

### The Nigerian Experience

In Nigeria, it is indeed the quest for sustainability in service delivery through revamping effectiveness and efficiency that actually provides an impetus for the number of civil service reforms ranging from the 1934 Hunt Committee through Tudor Davies Commission (1945); Walter Harragin (1947); Hugh Foot (1948); Gorsuch (1954); Mbanefo (1959); Morgan (1964); Adebo (1971); Udoji (1974); Onosode (1982); Dotun Philips (1988); Ayida Panel (1994); and Obasanjo Service Delivery Reforms (2003) (Ikeanyibe 2016).

It is imperative to note that the above reforms did not only aim at affecting changes in the civil service alone but in the public enterprises as well. More so as furthermore, the public enterprises in Nigeria experienced rapid growth between 1970 and 1980 through the intervention of these commissions of enquiry. This is because these interventions prompted the government to start rethinking the privatization and commercialization of public enterprise which reached its crescendo between 1999 and 2007 during the Obasanjo civilian administration (Dibie 2018). All these clearly depict attempts at public sector transformation which constitutes one level of administrative development.

Another stage of reform which demonstrates the drive toward administrative transformation is endeavors at revamping the managerial capacity in the public sector. It is however not a simple task isolating activities identified with organizational and structural transformation from these concerned with the enhancement of managerial capacity. This is so on the grounds that all panels that have investigated performance and the workability of the civil service and public enterprises in Nigeria have constantly included suggestions for enhancing managerial capability.

Making a critical glance and x-ray of the outcomes of various commissions saddled with the responsibility of public service reforms in Nigeria, starting from Udoji (1974) to Ani Panel of 1975/76; Onosode (1982); Philips (1988); and Ayida (1994), it is not difficult to identify certain broad areas of action which they all recommended improving efficiency in the Nigerian public service which includes using skills as guides for recruitment and promotion; evolving a result-oriented management practices; adoption of merit system and invigorated and modernized personnel and financial management practices; adoption of unified civil service structure; and adoption of Planning, Programming, and Budgeting System (PPBS) and Management by Objectives (MBO). Salary and welfare package increment and other numbers of recommendations geared toward enhancing performance and efficiency in public sector management. The Service Delivery Initiative (SDI) reforms, popularly called "Civil Service Renewal" under the Obasanjo's regime, came out with a broader and better focused civil service transformation strategies, where, for instance, the reforms mainly focused on the following areas: due process in public procurement; service charter; pension reform, monetization

policy; and National Health Insurance Scheme (NHIS).

The reform has as its strategic objectives the "right-sizing of Public Service; introducing new technology; redefining its mission; retraining officers in line with modern administrative procedures; and integrating the public service into the larger objective of national growth and stability" (Dibie 2018).

However, a critical evaluation of these reform strategies within the tenants of the New Public Management reveals that more efforts are still needed in some key areas such as the citizen charter; this is because despite the introduction of SERVICOM in the 2003's and 2007's service delivery initiative, the quality of service delivery is still very poor. Another important area is the issues of accountability and transparency in spite of the fact that the Nigerian public sector recently embraced Treasury Single Account couple with the operationalization of the Freedom of Information (FOI) Act which should serve as catalyst in speeding up the process for creating a responsive public sector; its juxtaposition with the official Secrets Act appears to have undermined its predetermined impact in entrenching transparency and accountability in the Nigerian public services, particularly in the light of pervasive incidence of corruption cases that litter the Nigeria public sector and has turn out to be very slamming and perplexing.

It is also important to note that the key performance indicators (KPIs), initiated by the National Planning Commission under the Transformation Agenda of the previous regime, appear to have captured this specific principle of NPM. However, making initiatives and implementing same are two different things; hence, only time can justify how the KPIs can prompt public service adequacy in Nigeria.

Finally, there have been enormous and persistent objection from public experts and analysts that costs of governance in Nigeria are high and that this is a burden on the public sector effectiveness. This requires administrative transformation and reform initiative that make for leaner productive and efficient government with accentuation on quality management techniques. This can be better acknowledged through public-private partnership principles like contracting, franchising, successful market provision of some service. The contention of public choice advocates that government can be too huge, detached from individuals, and captured by personal stakes is extremely applicable here.

## Conclusion

This entry provides a general cross-national and cross-cultural review of public service reforms in Malaysia, the Philippines, Brazil, and Nigeria. The entry viewed the reform initiatives in each country from within the prism of the New Public Management in which the following key differences in approaches were identified.

In Malaysia, reforms have been carried out using an integrated approach in order to overcome shortfalls of any particular model when applied individually. Three major reform models have been emphasized. These are structural functional, procedural, and behavioral. Various reform programs implemented have adopted a combination of two of these reform approaches. While the structural-behavioral approach has been closely adopted in the case of privatization, the Mahathir administration has not neglected the need for institution-building, an approach strongly emphasized by Tun Razak. In fact, structural, procedural, behavioral, and institutional approaches have complimented one another in many reform developments. Reforms that have taken place during Mahathir's leadership occurred during a period of heightened national self-confidence. For example, there is no record to indicate that his administration has invited any foreign experts or consultants to help out as was the case during Tun Razak's administration. This shows Mahathir's confidence in the role of PSD and MAMPU, the main driving forces in the current reforms, as reform agents.

Administrative reforms have been viewed by Philippine political leaders as a way to lay down the administrative infrastructure for effective governance. Unlike in Nigeria, Malaysia, and Brazil, the Philippines has no single reform agency that

coordinates and monitors all reform initiatives. The task of initiating and overseeing implementation of administrative reforms has been basically lodged with the government's oversight agencies. In addition to the activities of these agencies, many government offices have undertaken reform initiatives within their respective jurisdiction. The reform essentially seeks to reengineer the bureaucracy, minimize overlaps in program implementation by government agencies, and check the expansion of government activities. The streamlining effort, however, is only partially implemented to date because the Congress of the Philippines has yet to enact the legal framework to reorganize the bureaucracy.

This entry also reviewed the extent of the innovations of the Brazilian federal government with regard to the reform strategy geared toward changes in the paradigms of public management of the last decades. The result of the review indicated that the government is not necessarily following any specific well-structured and direct model of management. Instead, the operation of Brazilian public administration is based on a prolific number of similar principles and tools such as transparency, e-governance, and network governance. In this regard, administrative reforms in Brazil have been guided by incremental decisions with an individualized character than by decisions constructed on comprehensive implementation plans to change the normative management models or paradigms.

The Nigerian experience on the other parts displayed an array of reforms strategies which are all geared toward sustainability in service delivery through revamping effectiveness and efficiency of the public sector without necessarily following any specific model be it homegrown or externally borrowed and one particular feature that epitomized the reform strategy is lack of continuity of objectives. There is also an attempt in recent years to transform the public administrative system from the traditional bureaucratic model to the more market-driven NPM; however, more effort is still needed in many vital areas such as citizen charter, cost discipline, performance measurement, service quality, and accountability.

## Synonyms

Compliance; Criminal justice system; Responsive regulation; Securities fraud; Self-regulation

## Definition

Responsive regulation is a technique that focuses on dialogues and collaborations that maximize the role of collaborations and minimizes the role of the criminal justice system in the enforcement process.

## Introduction

"Crime without punishment: Canada's investment fraud problem" (Gray and McFarland 2017); "'I trusted him with my money': Woman says broker 'churns' her account, rakes in over $250,000" (Johnson 2017); "Man allegedly defrauded elderly woman of thousands to pay for strip-club visits" (Passen 2017). These headlines sum up the current state of securities fraud enforcement in Canada. Canada lacks a formal strategy to adequately protect the public from securities fraud. The Canadian provincial securities commissions and the self-regulatory organizations (SROs), the agencies responsible for policing Canada's securities markets and financial systems, respectively, are seen as ineffective regulators (Lokanan 2015, 2017a). The Royal Canadian Mounted Police's (RCMP) Enhancing Integrated Market Enforcement Teams' (IMET) failure to deal with investment fraud is also well documented in the literature (see Robertson and Cardoso 2017a; Lokanan 2017b). It is noted that the lack of resources by law enforcement agencies, coupled with ill-equipped prosecutors and an overarching defeatist mentality contributed to this failure (Lokanan 2014). In the cases where criminal convictions have been secured, the sentences imposed and the actual time spent in prison were seen as too lax to have any deterrent effect (Robertson and Cardoso 2017a). In terms of regulatory enforcement, the fines imposed were often not collected, a failure, which leads to question on the deterrence value of securities regulators' enforcement practices (Lokanan 2017a; Robertson and Cardoso 2017b).

To combat this problem, some have argued for Canada to have a national securities regulator (Lokanan 2017a). However, countries (e.g., the United States (USA) and United Kingdom (UK)) that already have national securities regulators also face legitimate enforcement concerns. What we have seen with the Securities and Exchange Commission (SEC) and the Financial Conduct Authority (FCA) (In April 2013, the FSA was split into two separate regulatory authorities – the Financial Conduct Authority (FCA) and the Prudential Regulation Authority (PRA)) in both the USA and the UK is that regulatory efforts have proven not to meet the purpose that the statues are aimed to address, creating a perverse effect and

endangering enforcement goals. The SEC, for instance, has often been cited for conspicuous failure and inefficiencies that undermines its legitimacy (Lokanan 2015; Simpson 2002). One of the many complaints is the command-and-control rule book-oriented strategies that dictate SEC's regulatory goals. The SEC's punitive enforcement approach engenders resistance, which creates a reduced incentive to cooperate with regulators. The same can also be said for the FCA. While the proposals for a national securities regulator in Canada may need some fine-tuning and are not politically realistic at this point, it should not be discarded because of the deficiencies and impracticalities highlighted in the recent Supreme Court of Canada's decision (In 2013, the Canadian government joined with Ontario and British Columbia to create the Cooperative Capital Markets Regulators (CCMR). For the other provinces and territories, most notably Quebec and Alberta, this proposition remains a tough sell. The federal government, together with Ontario, British Columbia, Saskatchewan, Prince Edward Island, New Brunswick, and the Yukon, is currently developing and planning to launch the Capital Markets Regulatory Authority (CMRA) in Canada.).

It is evident that the current regulatory model does not work to protect investors. Perhaps, a more systematic and innovative approach to securities regulation is found in Ayres and Braithwaite's (1992), and Braithwaite (2002) works on responsive regulation (Simpson 2002, p. 99). Ayres and Braithwaite's (1992) model focuses on dialogues and collaborations that maximize the role of responsive regulation and minimize the role of the criminal justice system (see Lokanan 2015). This is not to say that the criminal justice system's role is nonexistent; rather, it is not at the center of the enforcement process. The model they proposed is called responsive regulation. It is contended that regulatory objectives can be met when enforcement agencies display a pyramid with varying degrees of interventionism. The pyramid of sanctions as it is called "suggests that the greater the heights of punitiveness to which an agency can escalate, the greater its capacity to push regulation down to the cooperative base of the pyramid (Ayres and Braithwaite 1992; Braithwaite 2002, 2013).

In an attempt to make a case for responsive regulation, I build upon Braithwaite and his associates' work and argue for government-enforced responsive regulation to secure compliance with laws and ethical standards in Canada's securities industry. I will focus primarily on the self-regulatory organizations (SROs) that are responsible for policing Canada's investment dealers and brokerage firms who trade on the debt and equity markets in Canada – the Investment Industry Regulatory Organization of Canada (IIROC) – as a prototype example where responsive regulation can be applied. Responsive regulation involved engaging all stakeholders of a rule violation to come up with a flexible regulatory strategy that is arrange on a pyramid of sanction. At the bottom of the pyramid are the most frequently used strategies that are less punitive and coercive. The top of the pyramid is designed to deal with the more serious offenses and offenders. I argue that responsive regulation, that is, regulators willingness to escalate securities regulation up the pyramid of sanction and deescalate down the pyramid in response to members' compliance, is a promising strategy to market participants accountable to law and ethical standards.

The argument presented here has both theoretical and practical relevance. Theoretically, it illustrates how responsive regulation can be an effective strategy in regulating market participants in the securities industry. Practically, it builds on the theoretical discussion to suggest ways in which responsive regulation can be encourage as a regulatory mechanism to secure compliance. That said, however, it is not my intention, formidable as it is, to present responsive regulation as a panacea to tackle securities fraud. Rather, the contention is that there is no optimal regulatory strategy. At best, there are just different strategies that have a mix of strengths and weaknesses. In light of the 2008 global financial crisis (GFC), regulation of financial institutions needs as many proposals as possible with the hopes that one will shine through. The objective is to find ways to minimize the weaknesses and maximize the

strengths of responsive regulation to secure compliance (Ayres and Braithwaite 1992, p. 101).

The discussion is organized as follows. Following the introduction, I first argue that in today's political economy of regulatory flux, responsive regulation is a feasible alternative to entice compliance from market participants. I then briefly outline the concept of responsive regulation, sketch its theoretical underpinnings, and explain the key features of the model. In advancing the model, I illustrate how firms are allowed to write their own rules that are then publicly ratified. If the firm fails to enforce these privately written and publicly ratified rules, the rules will be publicly enforced by a government agency. Next, I present a regulatory mix of pyramidal enforcement to show that persuasion and punishment by one system should interact with the other in order for regulatory compliance to take place. This is followed by an illustration of how responsive regulation can work in the context of securities regulation. I use failure to supervise as an illustrative example. Finally, I present a conclusion and highlight areas for future research in the conclusion.

## The Theory Behind Responsive Regulation

The theory of responsive regulation has been developed in response to problems associated with government responses to businesses and the recognition that a significant percentage of businesses will not self-regulate (Braithwaite 2002; Ford 2013; Lokanan 2015; Simpson 2002). The main concern is the effectiveness of private enforcement in regulating corporate misconduct. Responsive regulation is not a clearly defined theory with a set of prescriptions that need to be followed; rather, it is a strategy that depends on the context, regulatory culture, and the history of the organization (Ayres and Braithwaite 1992, p. 5). A theory of responsive regulation can be broadly define as a form of social control against corporate misconduct engaged in by both individual corporations and trade associations that includes private enforcement of laws and corporate policies to prevent misconduct (Ford 2013; Lokanan 2015). Figure 1 below shows a diagrammatic illustration of how responsive regulation will work in regulating corporate misconduct.

As can be seen in Fig. 1, the pyramid of sanctions is geared toward enticing compliance through a combination of persuasion and punishment techniques (Effective enforcement can only occur when there is a genuine desire to comply with the law or when there is fear that the enforcement agency will take effective deterrent-oriented sanctions (see Lokanan 2015).). The aim of this pyramidal approach is to seek compliance through a restorative dialogue-based approach to justice (Braithwaite 2003, p. 30). This line of defense against corporate wrongdoers is mostly informal control, which is the socialization into ethical conduct and belief in the morality of the law (Simpson 2002, p. 112). Corporations who break the law should be persuaded to conform. It is expected that given a chance, firms will do the right thing and acknowledge their wrongdoing. To accomplish these objectives, the regulator first invites the responsible executive(s) to be a part of the dialogue. Two outcomes may manifest themselves at this stage; the individual either accept responsibility and shows remorse for the harm caused, or he/she proves to be a "tough nut" and denies any corporate wrongdoing. When faced with this scenario, the strategy is to widen the circle all the way up to the CEO or director of the company and invite him or her to join the dialogue. The idea is to work your way up the corporate ladder until you find a morally responsible actor who is moved by a sense of shame. The objective is to give the regulator actor the benefit of the doubt by assuming that she/he has a rational self and an irrational self, which means that the individual choses an action alternative that is criminogenic.

There is also the presumption that under certain circumstances, self-regulation may fail. For the minority of recalcitrant executives who fail to comply with the restorative approach, the regulator will take a more deterrence-oriented strategy by escalating up the pyramid. Human beings respond to different motivations. If at this stage

**Comparative and Development Public Administration and Policy, Fig. 1** Pyramid of enforcement sanctions for corporate misconduct

the individual(s) show signs of reform, responsive regulation means that they must move down the pyramid. The pyramid is firm, yet forgiving. The pyramid rewards reform and, in the process, acknowledges the effort the individual has made to comply (Braithwaite 2003, pp. 30–31). If the individual proves to be irrational (unwilling to reform and illicit repair because of his or her contempt for regulation), he or she will be escalated further up the pyramid to threats and actions of increased severity (i.e., suspension and revocation of license) (p. 32). The model does not assume that recalcitrant firms should be dealt with at one level of the pyramid by one enforcement or compliance strategy alone. Rather, the model assumes that the corporations are regulated responsively (and therefore effectively) by different strategies at different times, depending on their responses to different levels of regulatory intervention (Ayres and Braithwaite 1992). Scholz (1984) models regulation as a prisoner's dilemma game, where the motivation of the firm is to minimize regulatory cost while the motivation of the regulator is to maximize compliance outcomes. Under this model, it is assumed that there is equal power between the regulators and the firms they seek to regulate. TFT means that the regulator refrains from a deterrence response once the firm is cooperating; when the firm cheats on compliance, the regulator shifts from a cooperative to a more deterrent-oriented response. The optimal strategy is for the firm and regulator to cooperate until one or the other defects from cooperation. The rational player will then retaliate (the state to deterrence; the firm to a law evasion strategy). If the retaliation secures a return to cooperation by the other player, then the retaliator would be forgiven, and this would restore the benefits of mutual cooperation in place of the lower payoffs of mutual defection (see Ayres and

Braithwaite 1992, pp. 20–23).). In some areas, particularistic laws may serve to weaken the moral force of the universal legitimacy of laws (Simpson 2002). Responsive regulation posits that cooperation with the regulator should be rewarded, while failure to cooperate should be punished (Lokanan 2015).

## The Case for Responsive Regulation in the Securities Industry

The theoretical justification for responsive regulation is that regulators are more likely to succeed if they use strategies that are responsive to the context and culture of those who are being regulated (Ford 2013; Lokanan 2015). Within this context, the fundamental challenge for securities regulators is to design a system that would inculcate an investment culture that will put investors' protection mandate first, while the challenge for governance is to ensure that the system in place is actually applied (see Lokanan 2015). Ford (2013) opens up a discussion on scalability and responsive regulation to global financial regulation that considers whether as a practical matter, responsive regulation can be scaled up to more diffuse, multiparty, logistically complex contexts, such as financial regulation. In putting her proposal forward, Ford looks at the degree to which one of the essential elements of financial regulation – the direct interpersonal relationship as a basis of knowledge and action – is scalable to the kinds of contexts that concern us in financial regulation (Ford 2013, p. 3).

Ford's arguments have merits on the following grounds. The honest trading of securities is the "soul" of a successful capitalist economic system (Rosoff et al. 2003, p. 204). Unlike corporate crime, which hurts workers (e.g., violations of safety and health codes) or consumers (e.g., product safety violations), securities crime can undermine the financial system itself (Calavita and Pontell 1993; Lokanan 2017b; Rosoff et al. 2003). As such, when investment dealers resort to scandalous practices to maximize profits, the grand consequence is a malicious assault on the integrity of the free market system (Lokanan 2017a). Society also suffers from the moral infidelity of corporate leaders who succumb to greed (Calavita and Pontell 1993; Lokanan 2014). Not only are people's life savings and pension funds gutted but the community also loses, as employers shut down their businesses. The failure of the criminal justice system and regulatory agencies to control securities crime (Lokanan 2017a; Robertson and Cardoso 2017a) leads to considerable loss of investors' confidence and even greater loss in those who are trusted to be gatekeepers of the financial system (Lokanan 2014). Greater efforts need to be put in place to design proposals that will shore up investor's confidence, minimize uncertainty and risk, and generally stabilize the financial system (Calavita and Pontell 1993, p. 207).

Such efforts must come to grips with the fact that we live in an era of regulatory flux where "dramatic regulatory, deregulatory, and re-regulatory shifts are occurring simultaneously" (Ayres and Braithwaite 1992, p. 7). The new regulatory state, with its privatization of regulation by the government, has become more common, and governments are now looking for flexible regulatory approaches to monitor publicly traded corporations (Lokanan 2015). These changes are possible, especially in the financial sector, "where power flows through networks that are more fluid and complex than older structures of governance" (Healy and Braithwaite 2006, p. 56). It is particularly applicable to securities trading, where the state has generally left the regulation of the securities industry to the security commissions' agencies and self-regulatory organizations (Lokanan 2015). With the increase in securities fraud (Robertson and Cardoso 2017a; Lokanan 2017b), the public has been clamoring for greater accountability and transparency from brokerage firms. In most jurisdiction, these firms are left to monitor themselves, with securities agencies taking a back seat in the regulatory process – this regulatory style, of course, is the essence of self-regulation.

Fiscal pressures and general incompetence invariably prevent enforcement officers from regularly checking every brokerage firms for compliance with securities laws (Johnson 2017; Lokanan 2014; Robertson and Cardoso 2017a).

Responsive regulation envisions that a firm's compliance can be more effective, if its leaders take on some or all of the legislative, executive, and judicial regulatory functions (Ayres and Braithwaite 1992, p. 103). As self-regulating legislators, brokerage firms would devise their own regulatory rules; as self-regulating executives, these firms would monitor themselves for non-compliance; and as self-regulating judges, the firms would punish and correct episodes of non-compliance (p. 103). By combining "the benefits of voluntary self-regulation with the coercive powers of the state, responsive regulation has the potential to achieve greater inspectorial depth" than rigid "rule book" strategies (Simpson 2002, p. 100).

With a responsive approach, brokerage firms are in a much better position to police themselves than the state (Simpson 2002). Inspections would be conducted on a more regular and in-depth basis (Lokanan 2014). For example, in the pharmaceutical industry, the reputable companies have corporate compliance groups and regularly send teams of scientists to audit subsidiaries' compliance with production quality codes (Braithwaite 1984). Compliance officers will also receive better training, and they will be equipped with more resources and greater investigatory powers at their disposal, as opposed to external regulators (Simpson 2002, p. 100). This is because compliance officers have specialized knowledge of their organization's culture, which makes them more effective investigators than government workers who are forced to be generalists in the compliance process (Lokanan 2017a). Moreover, compliance officer's "greater technical capacity to spot problems is enhanced by a greater social responsibility to do so" (Braithwaite 1982, p. 1468). As such, they are better informed about business practices and the potential for misconduct (Simpson 2002, p. 100).

With the benefit of such insight, it is apropos for brokerage firms to design an internal regulatory system that inculcates a culture that values trust, transparency, and professionalism, while the challenge for the government is to make sure that these values and practices are applied (Healy and Braithwaite 2006, p. 56). It is more likely than not that regulators will succeed when they use strategies that are responsive to the culture of the firms (p. 56). In regulating securities trading, regulatory agencies must take into account the professional and organizational culture of the firms. Indeed, an important principle in making responsive regulation effective is to make sure that it holds executives of brokerage firms accountable with law and ethical standards (Ayres and Braithwaite 1992, p. 103; Simpson 2002, p. 99). At the same time, it must also attempt to protect investors from unscrupulous investment advisors and their respective firms (Lokanan 2014). Responsive regulation is a theory that purports to meets these objectives.

## An Illustration: Application to the Securities Industry

An efficient system of monitoring brokerage firms would ensure that an external regulator from the security agency checks that the internal self-regulator is regulating internally to make sure that standards are externally acceptable (Healy and Braithwaite (2006, pp. 56–58) applied this same approach to health-care providers in the USA.). By doing this, the regulator would satisfy two key elements that underlie the concept of responsive regulation: (1) public enforcement of privately written rules and (2) publicly mandated and monitored private enforcement of those rules (Braithwaite 1982, p. 1483). The external securities regulator would act on behalf of a governance network to make sure that the brokerage firms not only manage their own risk but also the risk of other firms in their network (See Ayres and Braithwaite's (1992, pp. 38–41) work for a review about the importance of industry association to cooperate in regulatory requirements.). For example, all the firms involved in retail trading would not only manage their own risks but also the way their network partners manage their risk. Thus, the Madoff's scandal would not only have repercussions for Madoff but also for all of the other brokerage firms in the USA. In this sense, everyone learns how to continuously improve by monitoring everyone else, and thus governance

is not top-down but collaborative (Healy and Braithwaite 2006, p. 58). This is important because it is through collective intelligence that a responsive regulatory approach can be synthesized and put into action (Lokanan 2015).

It is expected that responsive regulation will foster creative and continuous improvements in compliance strategies. Investment firms who happen to come up with flexible and creative programs designed to entice compliance, and make a good case that their standards are better than the default standards, will be allowed to implement them (This was done in the nursing home industry in the USA, where homes were required to identify their greatest health quality problems, choose one to improve each year, design an intervention, and measure the targeted outcome before and after the intervention. These objectives were accomplished not by a "command-and-control" rule but by the industry's own management creativity in finding better ways to manage patients without tying them to a chair or bed) (see Healy and Braithwaite 2006, p. 58.). This will secure creativity, flexibility, and cost-effectiveness by moving away from "command-and-control" strategies while simultaneously retaining public enforcement capabilities (Healy and Braithwaite 2006, p. 58).

To effectively illustrate the advantages of responsive regulation in the securities industry, it is best to examine one of the common problems experienced when regulating investment firms – failure to supervise (FOS). FOS is the inadequate supervision of a person, process, product, and policy by an investment firm that ran contrary to securities laws and ethical standards (Lokanan 2017a). In exploring ways to detect and prevent FOB offenses, regulators must look beyond the current deterrence model to one that use persuasive and self-regulatory strategies to secure compliance with laws and ethical standards. This approach is grounded in responsive regulation and is geared toward enticing compliance through a combination of persuasion and punishment techniques. A responsive approach seeks compliance through a restorative dialogue-based approach to justice (Braithwaite 2003, p. 30). As a first step in accountability, investment firms and their representatives who break the law should be persuaded to conform. It is expected that given a chance, the individual will do the "right thing" and acknowledge his or her wrongdoing(s) (p. 30).

Through this approach to compliance, each investment firm will be required to put together their own rules governing supervision that will prevent unethical trading practices. These rules should allow the firms to meet their operational requirements without any kind of manipulation while at the same time ensure public accountability and acceptable compatibility with that of other investment firms (e.g., in empowering the British Columbia's Securities Commission to ratify rules for investment firms, the government might want to list a number of criteria that all sets of rules governing trading must satisfy). Once these rules have been ratified by the securities agencies and made available to investors, any violation of them would be considered an unacceptable practice and would be punishable by law. By tying the specificity of these rules to the unique circumstances of the firm for which they were written, they would render fairness in enforceable accounts. As to what constitutes acceptable supervision standards, specificity can replace such blandness without the oversimplification for the majority of firms' inherent in universal securities law governing supervisions. There would not only be external audits, but internal audit groups would be mandated as well. Responsive regulation would produce simple and specific supervision rules that would make more efficient and comparable practices and enable easier disciplinary sanctions of rule violators (Braithwaite 1982, pp. 1473–1474). Regulatory agencies using a responsive approach to enforcement will be well positioned to apply the two key elements of responsive regulation: the role of the regulator (in Canada's case the provincial securities commission) as the "benign big gun" that carry big sticks and the capacity of SROs to start at the base of the pyramid by "speaking softly" to secure compliance or escalate up the pyramid to more serious sanctions for noncompliance (see Ayres and Braithwaite 1992, chapter 2).

## Conclusion

It follows that there is more mileage for regulators to illicit compliance through responsive regulation. In order to entice compliance through responsive regulation, each firm is required to write its own rules. Once these rules are ratified, any violation of them would constitute an offense. The company would be required to establish its own internal compliance inspectors to make sure these rules are obeyed and recommend disciplinary actions when they are violated. If management fails to take action, then the director of compliance will report the matter to the relevant agency to deal with. The role of the compliance agency would be to determine whether the company rules are in accordance with government policies, to ensure that the compliance group is independent of the corporate bureaucracy, to audit the performance of the internal compliance group, to conduct spot checks on the firm's compliance unit in order to ensure that they are making an attempt to detect violations, and to launch persecution for companies who subvert the compliance process (Ayres and Braithwaite 1992, pp. 131–132).

Defection from cooperation is less likely to be an attractive proposition when defectors face an agency with an explicit enforcement pyramid of sanctions, rather than when confronted with a regulator with only one deterrence option (Ayres and Braithwaite 1992, p. 36). A more difficult task is to find the right mix, where regulatory compliance based on restorative principles can be aptly backed up by deterrent-oriented strategies. The enforcement pyramid does just that. It allows regulators to rely on cooperation and self-regulation at the base of the pyramid and more punitive measures for the minority of recalcitrant firms at the top of the pyramid. The enforcement pyramid recognizes that restorative justice, deterrence, and incapacitation are all theories of compliance that have their flaws. The pyramid accounts for this by "covering the weaknesses of one regulatory strategy with the strengths of another" (Braithwaite 2003, p. 32). In short, by cooperating with investment firms until the circumvent rules governing securities trading, regulators avert the counter-productivity by undermining the good faith of the responsible firms (Ayres and Braithwaite 1992, pp. 26–27). A responsive approach allows regulators to be tough on firms who circumvent the laws but also give them an opportunity to reform and favor their socially responsible and law-abiding mandate over their venal selves (pp. 26–27).

Many important questions of how responsive regulation will work are not discussed here. How would it be implemented? How would the difficulties that arise be addressed? When is it appropriate to invoke the pyramid of sanctions? How would penalties be set? What constitutes discretionary punishment? All these questions need systematic empirical exploration. To address these issues, there needs to be new immediacy on research that sheds light on the virtues and greater simplicity of responsive regulation in securing compliance.

# Comparative Approaches to Private, Voluntary Development Aid

Susan Appe
Binghamton University, Binghamton, NY, USA

C

## Synonyms

Citizen initiatives in development; Grassroots development; International volunteering; Small-scale development

## Definition

Private, voluntary development aid is the direct allocation of donations from donors in the Global North to recipient communities abroad, most often through voluntary, nongovernmental organizations.

## Introduction

International development aid includes several channels, such as bilateral actors, multilateral institutions, international nongovernmental organizations (INGOs), private philanthropists, and increasingly international volunteers. Indeed, INGOs – large and small – are major players in the "aid chain" as they have "captivated the imagination of a wide variety of development planners" (Watkins et al. 2012, p. 286). They are important because foreign governments and private individual donors often do not have access to recipient communities. Thus, donors provide money to INGOs, and these organizations work with partner organizations and individuals to implement development aid programs and projects on the ground.

While much of the attention is given to larger INGOs, smaller, private, voluntary development NGOs also play a growing role in development aid. These small-scale INGOs can be described as

"altruism from afar" (Watkins et al. 2012) which has been "enabled by the latest wave of globalization" of the 1990s (Schnable 2014, p. 23). Indeed, there is a proliferation of aid actors more generally which has produced fragmentation and decentralization within the provision of aid ("little aid spread over many projects, programmes or sectors" as well as "little aid from many donors to many countries") (Schulpen et al. 2011, p. 321). Small-scale INGOs become vehicles for citizens in the Northern countries – from the United Stated to the Netherlands – to learn about the Global South (Schnable 2015, p. 310). In today's globalized world, communities are "stretched out" (Silk 1999, p. 8) and globalization has enabled "a widening of our geographical scope of concern" (Sin 2010, p. 985). As such, small, private, voluntary development NGOs are bridges through which ideas of global culture are expressed and transferred and are considered an alternative mode of development to the traditional international aid system.

## Labeling and Describing Small, Private, Voluntary Development Aid

Larger international NGOs (INGOs) have been watched more closely both in the press and academic literature since their "boom" in the 1980s and 1990s and given criticisms to their effectiveness. INGOs are entities between the state and the market which provide goods and services within development, humanitarian relief, and human rights and democracy promotion. INGOs have become a dynamic industry, which in practice has generated many creative labels well beyond NGO (see Table 1).

Recently, scholars have explored labels and descriptions for smaller efforts to development aid as small, private, voluntary development NGOs are growing in number (see Table 2). In the United States, for example, they are an "ever more common way of delivering aid" (Schnable 2015, p. 326), having grown in scope from 1000 in 1990 to over 11,000 in 2010 (Schnable 2015). In fact, private, voluntary development NGOs are found in every state and are in one out of the every three countries nationwide (Schnable 2014). Previously, 20% of US-based INGOs were found in

**Comparative Approaches to Private, Voluntary Development Aid, Table 1** Creative labels and descriptions for INGOs working in development aid

| Acronym | Description |
|---|---|
| GONGOS | Government-organized NGOs |
| GRINGOs | Government-run, -inspired, or -initiated NGOs |
| QUANGOs | Quasi-NGOs |
| BONGOs or CONGOs | Business- or company-organized NGOs organized as tax dodges or to create a benevolent image for a company |
| BRINGOs | Briefcase NGOs |
| BENGOS | Bent or crooked NGOs |
| COMENGOs | NGOs which disappear and then resurface elsewhere or later |
| PANGOs | Party NGOs which seek to mask involvement in party politics by posing as an NGO |
| MANGOs | Mafia NGOs with a criminal dimension |

**Comparative Approaches to Private, Voluntary Development Aid, Table 2** Labels and descriptions for small, private, voluntary development NGOs

| Acronym | Description |
|---|---|
| SINGOs – small INGOs | SINGOs are characterized by their direct allocation of donations from US donors to recipient communities abroad. SINGOs are predominantly volunteer-run and have administrative costs below 5% of the operational budget |
| GINGOs – grassroots INGOs | GINGOs have "meager budgets – often $25,000 per annum or less – and copious volunteer labor" (Schnable 2014, p. 4) |
| PDIs – private development initiatives | PDIs tend to focus on education and health projects, and they have budgets around $50,000. In the Dutch context, private development initiatives (PDIs) have also been referred to as MONGOs which stands for "My own NGO" (Kinsbergen and Schulpen 2016) |

NYC and Washington, D.C., but since 1990 (i.e., the onset of the current wave of globalization), it has decreased to about 11% (Schnable 2015). Likewise, in other parts of the Global North such as the Netherlands, the number of private, voluntary development NGOs is considered large, ranging from 6400 to 15,000 (Kinsbergen and Schulpen 2013).

## Why Small, Private, Voluntary Development Aid?

As stated in the introduction, globalization has enabled greater interaction between the North and the South. Indeed, this has allowed "companies, philanthrocapitalists, famous stars (or: celebrity humanitarians) and 'ordinary' individuals [to] feel urged to actively contribute to the global fight against poverty" (Kinsbergen and Schulpen 2013, p. 50). These private, voluntary development efforts are distinctive because of their voluntary emphasis and philanthropic charge to give time, goods, and money.

In addition to globalization, a second reason for the emergence of small, private, voluntary development NGOs is that the funding environment for development aid more generally in the Global South is shifting and has reconfigured. There is evidence that official development assistance (ODA) is decreasing in some regions (Appe and Pallas 2018). This has created what is referred to as "post-aid world" conditions (Banks et al. 2015; Appe 2017) and has resulted in the need for several adaptive strategies for both Northern and Southern NGOs as well as other development actors (Appe 2017). These shifts have brought about new directions in development aid, including new funding mechanisms and new donors, such as small, private, voluntary development NGOs. Other directions have included innovative financing mechanisms (IFMs), as well as shifts away from government-to-government and donor-to-recipient relationships. In addition, more reliance on market principles in some cases has brought in greater numbers of private companies, philanthropists, foundations, and private individuals. Additionally, many regional and local governments "have moved 'into aid'" (Schulpen et al. 2011, p. 323).

Third, small, private, voluntary development NGOs offer an alternative to larger INGOs and other development actors. Scholarship has yielded criticisms that many INGOs have not lived up to their promises in the Global South. Challenges include project management failures, such as the application of universal management practices across diverse development contexts, emphasizing outcomes over organizational learning, ignoring program management capacity and needs, and the challenges presented by diverse cultural contexts (Watkins et al. 2012). In addition, the co-opting of development goals by policy shifts in the 1990s, the re-organizing of development goals after 9/11, and challenges inherent in addressing the multifaceted nature of poverty have been criticized. The international aid system is under scrutiny for its lackluster progress in alleviating global poverty. Limited progress has led to questioned legitimacy, not only of INGOs but also about the underlying values and methods in the international aid system more generally.

Given the criticisms and the shifting environments, some have called for an INGO reset. As Doane (2016) laments, the INGO "sector needs, at the very least, a tune-up, if not a wholesale revolution to enable it to face modern times" (p. 1). And while in the past when under scrutiny, INGOs have responded with "codes of practice, joint charters, or training schemes" (Doane 2016, p. 2), these tools might not be enough. Doane (2016) posits that INGOs as we know them will not survive, and she asks, "how will INGOs face the issues of today, and what will they look like when they come out the other side?" (Doane 2016, p. 2). Indeed, small, private, voluntary development NGOs might provide an answer to this question.

Small, private, voluntary development NGOs have distinct organizational strengths and offer opportunities to address challenges faced by the international development sector more generally. They have the potential to be more efficient and have higher local impact than larger organizations. Additionally, they have the ability to pilot new projects with the potential to scale up and are

known to have an approach to development that emphasizes relationships and long-term impact rather than short-term outcomes. Despite these opportunities, very little is known about small, private, voluntary development NGOs. There is little empirical evidence about their perceived advantages and potential challenges in comparison to other development actors.

## Small, Private, Voluntary Development NGOs

Small, private, voluntary development NGOs have a dual identity; on one hand, they are framed as "small is beautiful" and "let a thousand flowers bloom" (Schnable 2015) because their smallness encourages grassroot development and their expansion in numbers allows for a diversity of ideas to flourish. On the other hand, scholars have identified how private, voluntary development aid NGOs provide uncoordinated development projects in isolation with high transaction costs (Kinsbergen and Schulpen 2013, 2016). Their voluntary nature, their size, and inherent resource constraints do not lend to having professional legitimacy (Schnable 2016). The question of sustainability also is challenged as relationships are informal and based on personal networks. Kinsbergen and Schulpen (2013) pose the question about whether this is sustainable as these relationships are perhaps linked more closely to friendships than to strategic partnerships. For example, these relationships might not include local authorities and other organizations working in the contexts and as a result hinder development projects (Schnable 2016). Additionally, formal accountability mechanisms and means for monitoring and evaluation are limited, and this might result in little learning within and across private, voluntary development NGOs (Kinsbergen and Schulpen 2013).

Indeed, small, private, voluntary development NGOs do not have a "professional logic that guides" the work (Schnable 2014, p. 13); rather, at their core are time and other resources provided by volunteers. Volunteers are educated but not professionally trained in management or development. Questions remain about the effectiveness of small, private, voluntary development NGOs. The same concerns related to effectiveness of larger INGOs might also transpire in smaller INGOs. The following considerations can be made about these small, private, voluntary development NGOs:

1. Small, private, voluntary development aid NGOs are dependent on volunteers, and as such there are concerns about them being another means in which neoliberal tenets seep into the international aid system (Palmer 2002). The dependence on volunteers suggests that private, voluntary development NGOs might promote further privatizing of development. However, in many cases, acts of volunteering in these organizations have spanned decades, despite global disasters and wars abroad as well as domestic and global economic crises. Withstanding these challenges suggests an ability to maintain a level of sustainability. Further research will need to look at private, voluntary development NGOs' connection to international volunteering and the growing industry – and it is just that, an industry – of voluntourism.
2. Additionally, small, private, voluntary development NGOs hinge on the personal and professional networks of the founders, which are crucial for the organizations' donor base and volunteer outreach. Small, private, voluntary development NGOs are at times aided by the networks of the organizations' founders which are local such as higher education institutions and churches. For example, research has found that private, voluntary development NGOs often have links to religious congregations. In a random sample of 150 small development NGOs in the United States, 41 organizations outline religious rationales for their development work and 46% of the organizations have partnerships with religious congregations (Schnable 2016). Similarly in the Netherlands, 50% of surveyed founders and volunteers of private, voluntary development NGOs self-identify as religious. Further understanding is needed on the role of founders' networks in private, voluntary development NGOs. The founder is often the primary actor who has

the ties with the recipient community, donor relations, experience with the record keeping, and most other major organizational duties. This deserves greater inquiry as it is related to the sustainability in particular of smaller INGOs.

3. For the most part, small, private, voluntary development NGOs are not linked to NGO intermediary organizations. Further research might seek to better understand the challenges produced when working in isolation and not having links to NGO intermediary organizations. Traditional and professional aid actors default to assuming that private, voluntary development NGOs are amateurs who need to be educated in doing "development work in the right manner" (Kinsbergen and Schulpen 2016, p. 1–2). For example, in the Dutch context, training opportunities suggest that small, private, voluntary development NGOs need to follow the professional norms of the more traditional, larger development INGOs. However, this is a tension, as explained by Kinsbergen and Schulpen (2016): "The idea that these private initiatives need to be educated in the work of 'doing development' is in sharp contrast to that of the PDIs themselves" (Kinsbergen and Schulpen 2016, p. 1–2). How might shared learning and training activities strengthen the work of smaller, private, voluntary development NGOs and how might they contradict the essence and values driving private, voluntary development aid?
4. Small, private, voluntary development NGOs also pose questions related to impact. More rigorous research into the impacts of these organizations is needed and this is twofold. First, the impact of private, voluntary development NGOs on recipient communities needs to be further explored through case studies and broader comparative study. More inquiries about the on-the-ground work of small, private, voluntary development NGOs and to what degree they are demonstrating development results are needed. Even the traditional aid community has called on needed changes in the international aid system, particularly related to the fragmentation and decentralization of aid actors (Schulpen et al. 2011, p. 331). The OECD (2009) recommended that "donors should focus assistance on fewer countries, sectors and, in particular, activities" (as cited in Schulpen et al. 2011, p. 322). Small, private, voluntary development NGOs might represent fragmentation and decentralization of aid, but most often these initiatives are focused to one country. More research on effectiveness of this type of aid model is needed.

The second prong is the impact that small, private, voluntary development NGOs and the experiences of their donors, board members, and volunteers have on donor country communities. These organizations are another means in which the North learns about the Global South (Schnable 2015). As explained by Schnable's (2015) work on grassroot development organizations in the United States:

> When grassroots aid workers travel abroad, their understandings of aid-receiving countries will be shaped by their training, language skills, and time in country (or lack thereof). As these volunteers return home and engage in typical nonprofit tasks – setting up fundraising campaigns, building their groups' websites, and engaging in conversations about their work – they will create narratives about the causes of underdevelopment and the role of Americans in remedying it. The dispersion of aid groups is a therefore a force likely to shape grassroots American understandings of Africa, Asia, and Latin America and the place of the United States in the globalizing world. (p. 312–313)

Small, private, voluntary development NGOs can provide an alternative development channel for aid which seeks to contribute to on-the-ground development in the Global South, and, indeed, these organizations will influence how communities in the Global North understand global poverty and development.

## Conclusion

INGOs are important actors in international aid system, and small, private, voluntary development NGOs merit further study. By recognizing

globalization, shifting funding environments for NGOs in many Global South contexts, and the challenges for larger INGOs in the international aid system, smaller, private, voluntary development NGOs might present an alternative mode of development with promise. Undoubtedly, small, private, voluntary development NGOs provide new possibilities and new challenges for the international aid system.

# Comparative Capacity Development

Svetlana Inkina
Center for Institutional Studies, Higher School of Economics, University of Toronto, Moskva, Russia

## Synonyms

Government effectiveness; State authority; State domination; State power; State strength

## Definition

State capacity refers to the "institutional core" of state power, which is the ability of the state and its agents to carry out policies and deliver public goods. State capacity may be described as an operationalized measure of state power, which refers to the ability of the state to sustain itself and induce compliance of state subjects.

## Introduction: Background Concept

Good living conditions (e.g., safety, employment, housing) are fundamental to the well-being of people. These conditions result from economic prosperity, individual rights, public goods, and quality governance, which emerge as a result of a complex interplay among large-scale changes and the strategic interaction of people with institutions. The discussion has not yet been settled around the question of how much state power is required vis-à-vis other societal forces to maintain a well-functioning democracy. Failure to respond to economic crises or deliver public goods may result in the loss of internalized faith in government (the loss of legitimacy). On the other hand, the overdevelopment of state institutions may distort the incentive structure behind the formation of a viable political and economic system.

State capacity is a crucial concept in political science literature. It refers to the process of state

building, e.g., the construction of the state defined by its monopoly of the legitimate use of violence on a given territory. According to McAdam et al. (2001, 78), state capacity is the "degree of control that state agents exercise over persons, activities, and resources within their government's territorial jurisdiction," and therefore, it is highly important for measuring state effectiveness.

The discussion of state capacity gained momentum during the 1970s and 1980s, when the state was no longer treated as a symbolic arena for non-state actors. This "statist" movement – also described as "Bringing the State Back In" (BTSBI) – responded to the weaknesses of pluralist accounts arguing that political power was widely dispersed rather than centered in a limited number of institutions embracing all sorts of management and control mechanisms. Instead, this approach argued that the state can act as an autonomous, uniform, and effective actor triggering economic growth. The view advanced by "statist" scholars responded to the observed conundrums of economic development, such as the growing number of "failed states" (see Helman and Ratner 1992), the unequal performance of emerging economies, the collapse of Communism, and the difficulties of democratization and state-building processes observed all over the world. The views of BTSBI theorists were analytically distinct from Marxist views on economic formation as the decisive factor of power relations, or an elite approach, which focused on circulation and reproduction elites rather than their capacity to act or regulate policy domains.

Academic efforts to conceptualize state power and state capacity started early in modern history. A number of authoritative scholars, such as Talcott Parsons, Reinhard Bendix, Max Weber, Peter M. Blau, Raymond Aron, and others, elaborated on the concept of state power defining it, in generic terms, as the chance or probability of imposing one's will upon the behavior of other persons. Since then, the concept of state capacity has been developed both empirically and theoretically.

Not all academic scholarship, however, has focused on the concept of state capacity exclusively. Instead, alternative concepts were developed, such as state strength (Migdal 1988), state power (Tilly 1975; Mann 1984; Skocpol 1979), government effectiveness (Rothstein 2011), etc., which all describe the ability of the state to sustain itself, execute policies, and deliver public goods.

It is now recognized that some level of state capacity **is necessary for democratic consolidation process to occur** (democracy is not possible when institutions are not in place) (Carothers 2002; Diamond 2000; Fukuyama 2004). In this context, it is acknowledged that there are weak and strong states operating within the confines of strong and weak societies.

High-capacity states provide conditions necessary for economic development, such as regulation, property rights, law enforcement, bureaucratic training, social and economic infrastructure, and other public goods, such as education, health care, and human security. By contrast, low-capacity states provide insufficient conditions for development or do not fulfill their obligations fully, which results in the declining levels of trust in government, economic underdevelopment, and even state failure (Rotberg 2003; Skocpol 1979).

Competing theories of state power (class theory, elite theory, pluralist, and gender theories) inform the discussion of state capacity as an explanatory variable of political relations. Elite theorists, for example, observed that power is exercised by the upper-level social groups who may be identified as leaders in a given field of competence (see Vilfredo Pareto and Gaetana Mosca). Elite groups, in view of the above researchers, may not necessarily seize control over the means of production. Instead, these are bureaucrats and other influential groups that may be divided into the subgroups of governing and non-governing elites.

Both Marx (1967) and Weber (1947) argued that modern states tend to be over bureaucratized and, as a result, use public bureaucracy as a powerful instrument of political management, manipulation, and repressive control (Farazmand 2010). However, unlike Marx (the founder of class theory), Weber argued that bureaucratic organization is one of the most efficient forms of organization.

Finally, the "discursive" elements of state power were propagated by social constructivist theories, such as gender theory, arguing that the relationships of power are reproduced with the use of informal norms and means, such as communication and culture. The discursive elements of state power were taken for granted by structural accounts of power arrangements. However, all these theories agreed on the possibility of instrumental use of power. The meaning of power varies, depending on a historical context and limitations of relevant political science scholarship.

The concept of state capacity promises to narrow the definition of state power to the concept that may be measured either as a uniform or nonuniform entity. The state, for example, may be defined as a set of organizations (or organizational capacities) invested with authority to make binding decisions. This view of the state implies that the state is by no means a uniform entity. Various dimensions of state power may reinforce each other or "steal resources" from other dimensions of state capacity depending on the type of administrative policy enacted by the top-level decision-makers.

## Directions of Research

The discussion of state capacity vis-à-vis policy implementation process allows identifying several important directions of scholarly research:

1. The first direction concerns state power and state domination – the core subject of state capacity literature. Weber defined the state as "a human community that (successfully) claims the monopoly of the legitimate use of physical force within a given territory" (Weber 1946, 77–128). Accordingly, two forms of state domination were identified based on coercive means of compliance and non-coercive means of compliance (authority). State power, in Weber's view, is exercised via bureaucracy, which means that the more professional bureaucracy is the more authoritative the state is. Thus, unlike Foucault, who argued that power penetrates every single aspect of our daily lives, Weber suggests that state agents use power instrumentally.

In line with Weber's distinction of violent and nonviolent means of domination, Michael Mann (1986) identified two forms of power, e.g., *despotic* and *infrastructural power*. Despotic power referred to state's capacity to enforce legislation without routine negotiation with civil society groups (in other terms, it may be described as repression), while infrastructural power concerns state penetration, its operational capacity influencing *implementation* of public policies. The notion of infrastructural power triggered academic debate on state capacity. However, this concept is rarely referred to as "capacity to implement policies," or "policy-making capacity," which could be described as an equivalent of and an operationalization measure of infrastructural power described by Mann.

Nearly all scholars belonging to the group of "Bringing the State Back In" (BTSBI) discussed various forms of non-coercive forms of compliance due to the increasingly sophisticated means of state domination.

Margaret Levi, for example, examined such forms of non-coercive compliance as **quasi-voluntary compliance, consent, and legitimacy** (Levi 1989). She and other scholars (cf. Evans et al. 1985) associated non-coercive forms of compliance with the means used by the state to sustain itself (e.g., fiscal capacity).

Charles Tilly advanced an argument that "war made the state" (Tilly 1975, 42). However, his research accounted for the ways in which European powers engaged in efforts to mobilize resources and thus sustain themselves financially.

2. The second direction of research observed within the BTSBI literature concerns state's relationship to other forces. Several issues have been discussed here: first, how autonomous the state shall be to exercise power and, second, how effective the state can be when it extends its power over community of non-state actors or when it fails to do so (see Ottervik 2013).

Barbara Geddes in the *Politician's Dilemma* (1996) defined state capacity as the implementation power of the state, which falls under the category of bureaucratic capacity.

Bureaucracy, in Geddes' view, has to be insulated (autonomous) from political pressures and adheres to merit-based principles, in order to achieve substantial outcomes. However, bureaucratic autonomy is largely impeded by the dilemmas political actors face when appointing top-level bureaucrats. Among such dilemmas influencing bureaucratic quality are leaders' career incentives, leaders' position within the party, party discipline, party's age, and the distribution of parliamentary seats.

It is noteworthy that the literature on state-society relationship has moved gradually from "state versus society" dilemma (or state against society) to "state-in-society" perspective. For example, Joel Migdal in *Strong Societies and Weak States* (1988) outlined a reverse relationship between state capacity and community capacity. State and society, in Migdal's view, compete in public arena. Therefore, the stronger social organizations are, the less likely the government will dominate the entire process of policy-making. The interaction of the state and society, in Migdal's view, creates several possible outcomes: (1) a full subjugation of social forces characterized by a total transformation of society, (2) state incorporation of social forces and subsequent mutual transformation, (3) adaptation of social forces to state's presence with partial incorporation of social forces, and finally, (4) the failure of the state to penetrate society with little transformative effect of the state on society. Similar to Mann (1986), Migdal defined **state capacity as power**. This take on state capacity was different from the view advanced by Skocpol (1979) and Geddes (1996) who defined state capacity as state autonomy or the refinement of state bureaucracy.

3. Finally, the third issue concerns the role of the state in economic development and the effects of public investment on state capacity development. During the mid-1990s, there has been an increased interest in state industrial policies. Useful analytical insights transpired outlining various institutional conditions that make structural transformation (industrial growth) possible. Peter Evans (1995), for example, argued that institutional structures in place affect economic growth. Among such factors is "state embedded autonomy," which is based on states' organizational coherence (insulation from external pressures influencing the decision-making and implementation capacity) and its connectedness to other societal forces within the industrial sector. Evans identified predatory, intermediate, or developmental types of states. The state was referred to as an autonomous actor whose effectiveness requires a certain condition to be reached that would allow state actors gaining information about other actors and using it effectively with the goals of economic development in mind (state "embeddedness," in this context, meant knowledge about other important industrial players).

In a similar vein, Linda Weiss (1998) observed variation in the developmental capacity of emerging and thriving economies. Based on the case studies of Taiwan, Japan, South Korea, Sweden, and Germany, she identified two types of developmental capacity, e.g., transformative and distributive capacity. Taiwan and South Korea, in her view, represented the cases of the former type; Sweden represented the case of the latter model; finally, Japan and Germany represented a combination of both models.

The relationship of the state vis-à-vis other societal forces remains highly contested. Some authors refer to the state as a uniform entity. However, a growing consensus has emerged over time around the state as a "set of organizations invested with the authority to make binding decisions for people and organizations juridically located in a particular territory and to implement these decisions using, if necessary, force" (Rueschemeyer and Evans 1985, 46–47).

The view of state capacity as a multidimensional concept responds to criticisms arguing that the dichotomy of "weak" and "strong" is likelier to obscure rather than reveal something. In fact, the observed facets of institutional capabilities allow accounting for various dimensions of state power.

The movement toward a more **nuanced** and **differentiated view of the state** may be observed with reference to the discussion of bureaucratic transformative capacity. To remind, Weber claimed that power comes into existence with

the use of bureaucratic instruments, where bureaucracy is an instrument of power.

In this context, Knill (1999) suggests that state bureaucracy is not a uniform entity; it is normally split into groups with distinct transformative capacities, which influence their ability to access policy-making decisions. Capacities of national bureaucracies are defined as a combination of political factors, such as the strength of the executive, the amount of discretionary power allocated to regional and local bureaucracies, the unity of the regional elites, and the ability of such elites to influence policy-making decisions. Therefore, among crucial factors influencing state capacity to implement policies are the existing administrative structure and the national political system.

Based on the cases of Great Britain and Germany, Knill (1999) outlines two varieties of transformative capacity observed in national bureaucracies. The first type is the type of instrumental bureaucracy, which is characterized by the lower number of veto players in a political system and the increased level of political centralization (unitary administrative systems). The second type is the type of autonomous bureaucracy, characterized by the dispersion of power across public space and a variety of bureaucracies acting as the locus of national identity formation. The typology offered by Knill is based on the opposition of common law tradition and civil law (continental) tradition, where the second type is less prone to massive changes in a short period of time. Conditions that help determine the transformative capacity of national and regional bureaucracies may include the way in which power is divided between political elites and civil servants (politician-civil servant nexus), the independent political power of regional bureaucracies, organizational attributes, corruption, clientelism, and so forth.

The discussion of transformative capacities of national and subnational bureaucracies did not receive much attention due to the difficulties of operationalization and measuring institutions in flux.

## Operationalizing and Measuring State Capacity

It is noteworthy that there have been just a few efforts to operationalize and measure state capacity. Cross-country measures of state capacity are nearly absent in public debate. Meanwhile, the discussion of state capacity is important for the study of government performance, including the success or failure of policy-making efforts in a public sector.

One of the many possible indicators of state's capacity to act effectively is the Government Effectiveness Index (GEI), calculated annually by the World Bank (for more information, see World Bank Governance Indicators). This index is used in reference to many diverse phenomena, which is the reason it is criticized for the lack of accuracy in its assessment of real-life phenomena, e.g., measurement validity (see Andrews 2007).

Savoia and Sen (2013) define state capacity as "the institutional capability of the state to carry out various policies that deliver benefits and services to households and firms" (Besley and Persson 2011, 2). As a way of measurement and operationalization, they offer the distinction among the following dimensions of states' institutional capability:

1. Bureaucratic and administrative capacity – this concept reflects upon the level of competence of national bureaucracies, their ability to implement rules and regulations, especially in the area of spending revenues on public goods (e.g., Evans and Rauch 1999; Knill 1999).
2. Legal capacity – this concept includes regulatory capacity and effectiveness of state regulation based on evidence-based policy-making practices; law enforcement capacity, including rule of law, mechanisms for resolving disputes, law enforcement, and an effective judicial system; and security and protection of state borders.
3. Infrastructural capacity – this dimension refers to state operational capacity, the territorial reach of the state (state penetration), i.e., the presence of organizations representing the

state within historically established borders (see Mann 1986; Soifer 2008).
4. Fiscal capacity is the state's ability to sustain itself through wealth, raise revenues, avoid fiscal crime, and minimize economic crime, such as tax evasion, in a contemporary context (see Levi 1989).
5. Military capacity refers to country's external security, state action beyond national borders, with the use of military force, state alliances, and state's ability to use police and military forces that can repress insurgent groups (Tilly 1975; Mann 1986; Hendrix 2010).

Public goods described in this classification system require state interference due to collective action problem, inspired by the very nature of benefits involved in the realization of relevant policies. Public goods are not always well suited for private regulation. That is, at the very basic level, the state is expected to guarantee property rights, protection of citizens from unlawful actions, security, and minimum social rights for its citizens, even in cases where resources are scarce or the state needs to outsource its services (see Besley and Persson 2011).

Measurements of state capacity rely on official documents, such as national statistics; fiscal reports on spending, etc.; and expert opinion surveys. Surveys are useful in cases, where official statistics does not fully account for the observed variables or whenever official statistics intentionally or unintentionally distorts information. Evans and Rauch (1999), for example, use expert surveys to conduct cross-nation comparisons of bureaucratic capacity measured as merit-based personnel policies. These measures relate to the conditions of professional bureaucracy outlined by Max Weber.

One of the most distinctive features of all research dealing with state capacity is its exclusive focus on policy implementation stage, without any reference to the process of policy formulation or the level of policy-makers' expertise. In this context, it is worth exploring not only the extent to which the government fulfills its role in the area of law enforcement or revenue accumulation, but rather the processes of agenda-setting and policy formulation, where significant battles occur around policy goals and mistakes, which underlie policy-makers' perceptions of cause-and-effect relationships about policy problems, happen.

## State Capacity Vis-à-Vis Policy Implementation Framework

During the 1990s, there were a limited number of efforts made by academics to link the discussion of state capacity to policy **implementation framework**. Thomas and Grindle (1994), in particular, argued that successful implementation requires a good strategy, but also massive resource inputs, which have to rely on appropriate structural conditions, such as regime stability and state legitimacy. First, if regime is stable, it is more likely to generate wide-ranging support for the program. Second, if it depends on a few extremely powerful interest groups (such as in case of state capture), it would be more difficult to ensure consensus among the top-level political elites concerning the goals of reform.

The discussion continued with the assessment of features describing "difficult" policy areas which require greater political investments. Among such features are concentration of costs in government, dispersion of benefits (long-term effects of the proposed policy changes), high administrative and technical content (technically complex areas requiring coordination), limited public participation, and long duration of the reform process (Thomas and Grindle 1994, 53–64).

The assessment of the political resource needed to support reform program in such areas requires consideration of who supports and opposes reform program, as well as the degree of support required for reforms to take place. In addition to the political support, bureaucratic, financial, and technical resources must be evaluated.

A number of scholars working within the stream of policy implementation research

elaborated on a variety of conditions that make policy change possible. Sabatier (1986), for example, summarized these conditions as follows: clear and consistent objectives, adequate causal theory, coherent legislative framework, implementation processes organized in a way so as to induce compliance by implementing officials, reform funding, reform communication strategy, professional civil servants, support of elites and interest groups involved in the process, and structural and contextual changes that do not threaten political support or causal theory (Sabatier 1986, 24–25).

Interestingly, scholars working within the field of policy implementation analysis scrutinized mainly noneconomic and nonindustrial policies of emerging economies. However, some of the insights gained in this process could be usefully applied to observe the process and outcomes of industrial growth across nations.

Contextual variables of policy implementation process outlined by policy implementation theorists include a wide range of material, structural, and ideational prerequisites of the reform. Most broadly, these conditions could be defined as the level of economic development (material resources required to material policy goals), political institutions in place, and the extent of policy-makers' expertise and their knowledge about other important actors involved in a given policy field.

The most effective way to describe state capacity in terms of policy implementation process would be through the lens of policy context defined as a set of formal and informal institutions that shape policy-makers' perceptions, decisions, and actions. The definition of policy context largely depends on the focus and the level of analysis. In this respect, both the developmental stage and the extent of state capacity to instill or absorb changes may be viewed as a condition that affects policy implementation outcomes.

## State Capacity and Democratization

The distribution of political and economic power within the society influences the operation and infrastructural capacities of any given state. The general capacity (efficiency) of the state largely depends on the number of institutional veto points entrenched in a system of relevant political and administrative arrangements.

In authoritarian and highly centralized states, individual leaders appear to be nearly unconstrained in their capacity to exercise power and establish control over resources necessary to induce compliance and maintain order. The policy process, in this context, may be characterized by somewhat unpredictable outcomes. On the one hand, the unanimous decision-making implies greater efficiency in the way things get done due to the top-down accountability structure. On the other hand, individual policy actors, in such context, would not have perfect information about problems and alternatives nor perfect computational abilities to solve highly complex policy problems. Therefore, policies would end up falling short of expertise implied by policy deliberation process, isolating or marginalizing minorities and other non-core elements of the existing political regime. These policies would have a more extensive time horizon spanning a few generations of human life, or even longer, depending on the institutional capacities of relevant states.

On the opposite side, liberal democratic political regimes provide conditions for the increased number of players involved in policy formulation stage and a more equal playing field for participants of electoral competition. Such systems usually build their policies on a dialogue among various forces involved in agenda-setting stage; they provide channels for public accountability and control and, as such, provide conditions for the development of more sustainable policies. Such design does not necessarily lead to the enactment of perfect policies. Some laws, in fact, risk never passing the stage of policy formulation due to the pressure of interest groups aiming to undermine reform agendas. However, instrumental rationality, central to the Weberian perspective on modern state, is an important characteristic feature of modernity, in which bureaucracy uses its power instrumentally in order to implement policies. Bureaucracy, in Weber's view, exercises control over society on the basis of scientific and technical knowledge and within the confines of legal procedures. State power, in this context, is

used to establish systemic relationships between the state and society.

One of the most crucial factors influencing state capacity to implement changes is the dynamic interaction between the existing political regime and state's administrative structure. Silberman (1993), for example, argues that the rationalization of administrative processes, i.e., the creation of the norms of bureaucratic system, was the consequence of political struggles, which "attempted to redefine the structures of power and the criteria for access to them by groups of leaders who sought to reduce the uncertainty over their status and power" (425). Heady (1996) supports this idea by saying that "what has become more and more obvious is the extreme importance of variation among political regimes as a major explanatory factor for variation among public bureaucracies" (472).

It is important to emphasize that political regime creates institutional and cultural underpinnings for the use of power, whereas state capacity affects the ability of the state to strategize and allocate necessary resources to the appropriate areas of policy-making process. Societies and states, characterized by the weak representation system, make it difficult for state subjects to contest decisions or influence the results of policy-making cycle. Societies that are prone to corruption are more likely to induce interest-based thinking and to follow the "who gains what" logic, which may turn out to be harmful during the stage of policy implementation process.

The timing of democratization process and its relationship with state capacity has been a recurring theme in the study of state-building efforts since the eruption of political crises in recent decades. One of the key issues observed, in this respect, concerns the sequence of reforms, such as the question of whether the process of democratization shall precede or build on the process of economic reform. It is noteworthy that, starting from the 1970s, there has been more than 100 countries transitioning from authoritarianism toward democracy. All of these countries varied according to the level of economic development, social and political capital, infrastructure, and other prerequisites of sociopolitical change. As such the level of state capacity seems to be insignificant for the initial stages of democratic transition (or even conductive for regime change), whereas the process of democratic consolidation requires institutional changes directed toward the improvement of state capacity to conduct and sustain reforms.

## Conclusion

This entry has provided an overview of "state capacity" literature, the body of which has been growing during the second half of the twentieth century. The discussion began with the review of background concept and the analysis of research focusing on the ability of the state to achieve its goals. Such dimensions of state capacity operationalization as bureaucratic, legal, infrastructural, fiscal, and military capacity were identified.

The weaknesses of state capacity literature observed include the difficulties of measuring and operationalizing state capacity and the absence of criteria for comparing various aspects of state capacity across nations. One of the most distinctive features of all research dealing with state capacity is its exclusive focus on policy implementation stage, without any reference to the process of policy formulation or the level of policy-makers' expertise. In this context, it is worth exploring not only the extent to which the government fulfills its role in the area of law enforcement or revenue accumulation, but rather the processes of agenda-setting and policy formulation, where significant battles around policy objectives occur and where mistakes of causation in policy-makers' efforts to link policy objectives to policy outcomes happen.

The entry has also provided an overview of major themes and questions raised by political science scholars with regard to the process of implementing public policies. One of such themes concerns the nature of state power and various forms of it. The next theme concerns state's relationship to other forces captured by the concept of state autonomy. Finally, the third issue concerns the role of the state in economic development and the effects of investment on state capacity development.

The current stage of research focusing on state capacity consists in the development of theoretical insights aiming to move the analytical focus of political science scholars beyond a limited number of cases. However, while the number of studies and variables observed is growing, the level of analysis chosen by "statist" theorists nearly always tailors their research agenda toward the confines of general frameworks rather methodological guidelines on how to measure and evaluate state power in a comparative perspective.

The discussion emphasizes the usefulness of policy implementation research developed within the field of public management and administration literature during the same years as the eruption of studies on state power. This literature fills the gap in academic discussion on problematic policy areas (policy areas involving benefits for all) and the conditions and prerequisites of policy change and implementation processes. Considering this, it would be useful to view state capacity as a context in which the process of policy-making occurs. Both the developmental stage and the extent of state capacity to instill or absorb changes may be viewed as a condition that affects the outcomes of policy implementation stage.

[2]Faculty of Public Governance and Administration Sciences, National University of Public Service, Budapest, Hungary

## Synonyms

Career employees; Merit-based employees

## Definition

Finer (1925) defines civil service as a professional body of officials who have been employed to a permanent job and are paid based on the skills and qualities they possessed.

Recruitment in the civil service is about finding suitable and sufficient number of employees to fill vacancies in the civil service.

## Introduction

The term "civil service" has been explained by various scholars varying from country to country. According to Kettl (2013), there must be in place some features to qualify a civil service across countries. To him, in all the civil service across countries, employees should be paid according to their rank and all employees should be protected from any form of political interference. Finer (1925) adds that the civil service should employ people into a public permanent job and be paid on the skills they have. Again, the employees of the civil service should be recruited based on merit and not through patronage (Kettl 2013).

Regarding recruitment, Fredericksen (1996) explained the concept as the process of finding and attracting people who are qualified as a pool of candidates for a job. Recruitment and selection into the civil service are key to civil services across countries. It is argued that recruitment by merit comes with a lot of advantages as opposed to the patronage system. The term "meritocracy" as popularized by Young in 1958 has been explained as a social system where talent and merit are the basis for looking for people to fill positions and distributing rewards (Everest-Phillips 2016). The 1997 World Development Report explains that meritocracy in the civil service helps attract high-quality personnel, confers some form of prestige on the civil service, and is a great motivation for good performance of personnel (World Development Report 1997).

According to Moon and Hwang (2013, p. 1), scholars have developed interest in conducting comparative studies on civil service systems

for different countries; however, "there is still a dearth of basic comparative understanding of civil service systems." To understand the different systems of civil service as used by different countries, Everest-Phillips (2016) has stated that more research on meritocracy in different contexts from around the world could offer wider evidence about how the practice of meritocracy may change over time. Based on these, this entry seeks to examine the status of civil service systems in three African countries – Gabon, Ghana, and Zimbabwe – by exploring their recruitment into the civil service and finding out the reasons for the similarities and the differences.

Specifically, the entry seeks to find out the extent to which the countries adhere to the principle of meritocracy in the recruitment of civil service personnel and to find out the factors that enhance or undermine the adherence to the principle of meritocracy in the recruitment of civil service personnel. The rest of the entry is structured as follows: the theoretical framework of analysis, methodology used for the entry, the findings and analysis, and the conclusions.

## Theoretical Framework of Analysis

The theoretical underpinning for this entry will be guided by two theories: the Weberian state hypothesis and the prismatic-sala model by Fred Riggs.

### Weberian State Hypothesis

Drawing from the insight of Weber, recruitment based on merit was identified by him as a one of the principles of bureaucracy. To Weber, he identified six principles of bureaucracy: written legal rules of administrative conduct, impersonality in service and decision making, hierarchy of offices and level in authority, people being specialized in the role they play and expert training, full-time employment toward retirement, and, lastly, personnel recruitment based on merit. It has been argued by Evans (1996) that it is necessary for the replacement of the patronage system by a professional state and that is a prerequisite for development. To him, the procedure for hiring and firing in the civil service should be through competitive examinations rather than political appointments and dismissals.

### Prismatic-Sala Model

This model was developed by a Chinese born American called Fred W. Riggs who has been regarded as the godfather of comparative public administration. According to Riggs (1962), societies are divided into three: fused, prismatic, and diffracted societies. This led to the fused-prismatic-diffracted model. These three models represent the traditional underdeveloped, developing third world, and the modern developed societies, respectively. According to Riggs, the fused and diffracted models are ideal models and cannot be found in real-life situations. To him, the fused model has a society which holds on firmly to their traditional and cultural values. Some features of the fused society are a single structure performing all functions. In this situation, one person performs all the economic, administrative, and political functions for the society. On the other hand, the diffracted society has different structures to perform specific functions and mostly found in the Western countries like the USA.

A prismatic model according to Riggs is described as a society lying between the ideal-fused and ideal-diffracted society. Adopting from the fused society, the prismatic society has some characteristics of the fused, where the prismatic society is seen to be kind of traditional and possessing the characteristics of the diffracted and it is seen to possess some form of modernity. In this model, tradition and modernity coexist; however, there is somehow a lack of coordination among the prismatic social structures. In the study of administrative systems, Riggs developed the prismatic-sala model to understand the administrative system of the prismatic transitional societies. It is believed that Riggs applied ecological models in analyzing societies and their administrative system. Riggs argue that the performance of the sala is shaped by specific forces like the elites and economic factors.

## Methodology

### Research Approach

According to Creswell (2013), there are three types of approaches used in a study. They are quantitative, qualitative, and a mixed method which combines a qualitative and the quantitative approaches. However, for the purposes of this entry, a qualitative approach is employed.

### Research Design

The entry uses a cross-sectional analysis which measures three countries in relation to civil service recruitment. It uses a cross-national and a cross-historical analysis of meritocracy in the civil service in these countries to perform this comparative study.

In selecting countries for this entry, the authors selected all the countries from Africa. The authors' criteria were to select countries based on income status: low income, lower middle income, and upper middle income, as these are the income levels prevalent in Africa. Again, the authors selected the countries based on their locations. This gave the authors some differences in the culture, as countries are likely to have some similar practices if they are found in one part of the continent. Using these criteria, three countries were selected by the authors: Gabon which is in Central Africa and an upper middle-income country, Ghana which is in West Africa and a lower middle-income, and lastly Zimbabwe which is located in the South of Africa and a low middle-income country.

### Source of Data

The entry uses data from the Global Integrity Index for its comparative analysis. The index uses close to 300 indicators to assess the existence and effectiveness of anti-corruption mechanisms that promote public integrity. The global integrity is a nongovernmental organization located in Washington which advocates for integrity and accountability in government. The index uses peer reviews of person recruited by Global Integrity Index and local country experts. The index has been in existence from 2006 and have been producing this index till date. The index is mostly targeted at developing countries.

Since 2013, the Global Integrity Index uses data from the African Integrity Indicators on 54 countries. The African Integrity Initiative follows a similar methodology as used by Global Integrity Index to cover the topics. In measuring civil service integrity, the index measures from the year 2013 to 2017.

## Findings

To measure meritocracy in the civil service recruitment in the three countries, two indicators used to measure civil service integrity by the Global Integrity Index are used for this entry. First indicator used was in relation to how in practice, the work of civil servants is not compromised by political interference. The entry limits political interference in recruitment into the civil service. It is assumed that, when there is a political interference, people are not recruited to the service based on merit but by political appointments. Data scores scale of 0–100 is used to measure this indicator with 0 being the minimum value representing civil service being compromised by political interference and 100 being the maximum value representing that, in practice, civil service works is not compromised by political interference.

Second indicator used to measure recruitment based on merit for this entry is that, in practice, civil service workers are appointed and evaluated according to professional criteria. Data scores scale of 0–100 is used to measure this indicator with 0 being the minimum value representing civil service workers are not appointed and evaluated according to professional criteria. The maximum of 100 represents that civil service workers are appointed and evaluated according to professional criteria.

## Civil Service in the Three Countries

### Civil Service in Ghana

Civil service in Ghana derives its legal framework from two legal frameworks: the 1992 Ghana's constitution and an Act of Parliament. The

Chapter 14 of the 1992 constitution is dedicated to the public service of Ghana where civil service is under the category. In the constitution, the Article 190 (1)(a) gives a legal framework in which civil service of Ghana should operate. The Article 190 (2) states that the civil service shall, until provision is otherwise made by Parliament, comprise service in both central and local government. Again, the civil service of Ghana derives its framework from an Act of Parliament. The civil service Act 1993 (PNDC Law 327) is also a Parliamentary Act to supplement what has been stated in the constitution. These two laws combined provide a legal framework for the operations of civil service in Ghana.

### Civil Service in Gabon

In the case of Gabon, the country is governed by the 1991 constitution. The constitution came into existence after Gabon became a multiparty democracy in March 1991. Since then, the constitution has undergone several amendments with the most recent being the Law No. 13/2003, the amendment of August 19, 2003. From the constitution, a legal framework is given to the civil service of Gabon. In addition to the 1991 Constitution of Gabon (as last amended by the Law No. 13/2003 of August 19, 2003), the Civil Service code of Ethics in June 2005 serves as a guide for civil servants in Gabon to conduct themselves in everything they do. A combination of the two laws provides a legal framework for the civil service of Gabon.

### Civil Service in Zimbabwe

The 2013 Constitution of Zimbabwe provides a legal framework for the civil service in Zimbabwe. Under the Chapter 10 which has been wholly dedicated to civil service in the Zimbabwe, the Article 199 (1) states that "there is a single civil service which is responsible for the administration of Zimbabwe" and consists of all persons employed by the state aside the security personnel, judges, and people who preside over courts, staff of parliament amongst other few (Article 199: 2). Besides the Chapter 10 of the Zimbabwean constitution dedicating a Chapter to outline the composition, the conduct of the civil service, the minister of civil service, and the composition of the civil service commission, the Public Service Act (Chapter 16:04) also adds to the framework of civil service in Zimbabwe. This act gives power to the civil service commission which is the supervisory body of the civil service in Zimbabwe.

## Recruitment Based on Meritocracy in the Civil Service of the Gabon, Ghana, and Zimbabwe

Civil Service in Gabon, Ghana, and Zimbabwe, according to the legal framework, are to practice meritocracy in their recruitments. As in line with Weber's principle of bureaucracy, civil service in these countries has included the principles of meritocracy into their service. Included in the constitution and the Acts are as follows:

Meritocracy in the recruitment into the civil service is explicit in the constitution of Gabon. The Article 47 (16) of the Gabonese constitution states in French, "*le statut général de la fonction publique et les statuts particuliers.*" This is translated to mean that recruitment in the civil service in Gabon should be based on the general statues of the civil service and special statues. With the general statues, it means that civil service recruitment should be based on meritocracy or to say that the civil service is run based on merit.

In Ghana, civil service recruitment as according to the civil service act is also based on meritocracy. The public service commission has been mandated to conduct recruitment into the civil service of Ghana. The commission adopts the merit-based system of recruitment and appointment into the civil service in Ghana. The public service commission has outlined the procedure for recruitment into the civil service on its website to ensure transparency in the recruitment process of the civil service in Ghana.

The case of Zimbabwe is no different from Gabon and Ghana. In Zimbabwe, the constitution explicitly states in the 2013 constitution the method of recruitment into the civil service. In the Article 203 of the Zimbabwean constitution, the constitution has mandated the civil service

commission to perform the following function, which is to appoint qualified and competent persons to hold post in the civil service. The Civil Service Commission in Zimbabwe has outline meritocracy, impartiality, and professionalism as their cherished value that they are using to achieve their vision of a world class employer of first choice.

## Similarities/Variations in Meritocratic Recruitment: Gabon, Ghana, and Zimbabwe

### Nature of Government

In comparing the three countries for analysis, the graph above shows a difference between the extents to which political interference can be seen in the civil service of these countries. It is evident that in political interference, Zimbabwe plays last among the three countries. As a result, a further analysis shows that the differences or variations in the political interference may be because of other factors which include the nature of government in the three countries.

Comparing the nature of governments in the three countries, it was revealed that Ghana has a democratic system of government while the other two countries – Gabon and Zimbabwe – show signs of autocratic forms of government. The BBC reports that in Zimbabwe for instance, since independence from the British in 1980 till 2017, Zimbabwe had only seen one president: Mr. Robert Mugabe, who ruled for the past three decades until he was removed from office in November 2017. Within this period, the BBC reported of several incidents which have shown signs of dictatorship or authoritarianism in Zimbabwe and the people who were against the president were targeted or had some violence meted against them. In 2002, Zimbabwe was suspended from the Commonwealth on presidential election dispute. Due to this nature of government, there is no doubt that Global Integrity Index reports that there is political interference in the civil service of Zimbabwe. All aspects of the Zimbabwe government are in the hands of Mr. Mugabe. As a result, interference in the civil service was presumably rampant. In 2008, after it was reported that Mr. Mugabe had lost the election to the opposition leader of Zimbabwe, members of the opposition became a target which led to some people fleeing from the country. It is therefore important to note that in most authoritarian regimes the civil service is most likely to be interfered politically.

The case is not different from Gabon however the extent of interference has been minimal as compared to Zimbabwe. According to a study conducted by the Marine Corps Intelligence Activity (2010) in the United States, Gabon is an authoritarian and centralized government. Gabon gained independence from France in 1961 and since then only three people have served as presidents: President Leon Mba, Omar Bongo who has been succeeded by his son, Ali Bongo Ondimba in September 2009. Political interference in Gabon is very common in all the facets of the government. As a result, from the Fig. 1 above, it is of no surprise that Gabon is at 25% in all the years used for this entry.

Political influence in Ghanaian civil service is very minimal as can be seen from Fig. 1. In 2016, data from Global Integrity Index shows that there was no shred of political influence in the civil service of Ghana as it scored 100%. This to some extent can be explained by the nature of government in Ghana. Ghana over the years has enjoyed smooth transitions of power from one party to the other. From the time of independence till date, Ghana has had more than six different governments. In the fourth republic alone, from the year 1992, Ghana has had five presidents through a periodic free and fair election which has been commended by the international organizations.

A comparison of the three countries show that civil service in Zimbabwe has a higher political interference and as a result refutes Max Weber's principle of bureaucracy which calls for politics out of the civil service to ensure that people are selected into the civil service based on merit. Due to political reasons or because of the nature of government that is in existence in the three countries, meritocracy in the recruitment into the civil

service is often absent in Zimbabwe even though it is gradually changing. The situation is however a little better in Gabon than Zimbabwe and best case amongst the three can be found in Ghana.

## Economic Factors

Variations or similarities in the civil service of the various three countries can also in a way be explained using the economic factors of the countries. Because civil service forms the major part of the government expenditure or civil service are people paid by the government, governments in this cross-national study are tempted to interfere in the recruitment and appointment of people to the civil service to be able to regulate it.

In Ghana for instance, recruitment and selection into the civil service is currently on freeze. This is because of some political decisions made by governments to suspend recruitment into the civil service. In 2010, the government of Ghana placed a ban on the recruitment of employees in the public sector as part of measures to stabilize the economy and effectively manage the public wage bill. This is as a result the economic factors did allow for recruitment into the civil service. As opposed to Max Weber's ideal type of bureaucracy, governments should not, in any way, politically interfere in the civil service as much regulating the recruitment and selection.

Gabon is noted to have a relatively high GDP and recognized to be one of the few economically stable countries in Africa. In all of this, it is estimated that the country's wealth and resources are in the hands of only 2% of Gabon population due to political and ethnic division in the country. Political interference in Gabon in relation to the civil service recruitment and appointment is face with a lot of economic challenges. Due to the overall economic challenges facing Gabon, the political powers are forced to interfere to regulate the civil service. In 2009 for example, President Ali Bongo ordered for head count into a bloated civil service to cut state spending and the taking charge of the body. This is a high extent of political interference. He claims the country is looking for ways to diversify its economy.

An analysis of the economic factors shows that the country's economy influences the politicians' participation in the civil service recruitment. Due to the cost involved in the remuneration of the civil service, the governments are tempted to come in and regulate the recruitment. This is to help them to properly manage the economy. Examples from the countries above show how economic factors influence the civil service recruitment in the countries.

## Cultural Values of Society

Besides the nature of governments and the economic factors affecting the meritocracy in the civil service of these countries, cultural values of the three countries sometimes affect the variations in the civil service as measured by Global Integrity Index across the 3 years. The cultural values of the society which harbors the civil service can in a way determine how meritocracy in the country's civil service can be adhered to.

**Comparative Civil Service, Fig. 2** In practice, civil servants are appointed and evaluated according to professional criteria

Source: Authors, based on data obtained from Global Integrity Index (2013-2017)

In Gabon, ethnic affiliation is one of the most important factors in Gabonese identity (Marine Corps Intelligence Activity 2010). Gabon has over 40 different ethnic groups and each Gabonese finds prestige in their ethnic groups and strongly identifies themselves with their ethnic groups. The Marine Corps Intelligence Activity (2010) further goes to say that like his father, Ali Ben Bongo has surrounded himself with trusted family members and build ethnic alliances and patron–client relationship. This has created a divide between the people who are close to Bongo and the rest of the people. Locally, this divide is known as the Bongo system or *Bongoïsme.* This is where people who only belong to the group are given a share of the national cake through recruitment and appointment into the civil service. This is how ethnicity has affected recruitment into civil service in Gabon.

In Ghana, cultural affiliation is not as rampant as that of the other countries. The constitution provides legal framework into the civil service. This provision seeks to get rid of all forms of ethnicity. Appointment into the civil service has been enshrined in the constitution and calls for a fair representation of ethnicity. Article 17 (2) states that "a person shall not be discriminated against on grounds of gender, race, colour, *ethnic origin*, religion, creed or social or economic status." Data from Global Integrity Index confirms that most appointments and recruitment into the civil service are not discriminatory as compared to the other countries in the study (Fig. 2).

Recruitment and Selection into the Zimbabwean civil service is full of nepotism and favoritism. Zinyemba (2014) argues that nepotism in Zimbabwean happens when top management positions use their influence into the recruitment of civil service. This influence is to secure jobs, which is used to favor friends and relatives. Nepotism in the civil service is based on ethnic ties and as a result recruitment is not based on meritocracy. It is evident that most politicians influence the recruitment and selection process by referring candidates for appointment to vacant positions. These are based on ethnic and cultural lines. It is therefore not surprising that Zimbabwe and Gabon are performing worse than Ghana in the civil service recruitment and appointment.

## Conclusion

This entry indicates that the civil service as practiced in some African countries go contrary to the Weberian hypothesis or principle which states that, the processes for hiring or firing in the civil service should be through competitive examinations rather than nepotism or political appointments and dismissals. Comparing three countries in Africa and their means of recruitment

into the civil service, it was found that the nature of governmental systems, economic factors, and cultural values varied among the countries under study; hence, it influenced the nature of civil service recruitment. This implies that recruits are not usually selected into the civil service based on competence and/or merit but sometimes political interference and nepotism. Analyzing the factors mentioned above shows that the economies of these three countries had influence on the political stands in the civil service as far as recruitment is concerned. To a greater extent, the sum of remunerations in the civil service also influences its recruitment.

# Comparative Civil Service Reforms in Sub-Saharan Africa

Genevieve Enid Meyers and Christopher Andrew Clark
Department of Political Science, College of Liberal Arts and Education, University of Detroit Mercy, Detroit, MI, USA

## Synonyms

African civil service systems; Comparative administrative reforms; Comparative public administration; Comparative public management; Comparative public service reforms

## Definition

The civil service is the bureaucratic arm of government charged with the implementation of government policies and programs. Comparative civil service reform is an approach to the study and evaluation of efforts undertaken by diverse governments to systematically improve their bureaucratic and public sector operational performance.

## Introduction

Civil service reform is a challenging endeavor for developed and developing countries alike. Moreover, there is no consensus as to what makes some reforms succeed while others fail. Yet, reform of the administrative system is not new. Reform in the nineteenth century aimed at stamping out the spoils system, and establishing efficient, effective, and economic administrative systems. The

twentieth century saw the focus shift to institution building, bureaucratization, nationalization, and an array of organizational and administrative capacity building efforts for national and economic development. In Sub-Saharan Africa, post-independence civil service reforms included indigenization of the bureaucracy and utilizing the civil service to spearhead the development agenda.

Contemporary civil service reform efforts in Sub-Sharan Africa are rooted in the 1980's structural adjustment programs (SAPs) and are part of a wider New Public Management (NPM) movement geared toward reversing the traditional role of government by shrinking the size of the civil service, reducing both administrative and financial waste, and improving performance and productivity, accountability, service provision, and general capacity of the administrative system. Since the reforms of the early nineteenth century, it has been argued that administrative reform engenders cheaper and efficient government, facilitates the production of high-quality services, frees managers to manage, and enhances ethics and accountability in government (Caiden 1991; Pollit and Bouckaert 2000; Farazmand 2002). Yet, despite such accolades, governments seem to implement one reform after another, signifying that such efforts do not always attain their goals and objectives.

The civil service systems in Sub-Saharan Africa have a long history, dating as far back as the colonial period. Some of the problems that emerged during colonialism are still prevalent. In addition, the functions and structures of these systems have, over time, been shaped by historical, economic, political, and ideological factors. The civil service that was inherited from the colonial regime at independence by many of these countries was relatively small and focused primarily on the maintenance of law and order. Since the 1960s, when many of the countries attained independence, their administrative systems changed both in structure and function. Besides maintaining law and order, they became the avenue for gainful employment, policy making, and social and economic development. It should however be noted that historical, political, economic, and ideological factors manifest themselves differently in Sub-Saharan African countries. Therefore, the civil service systems in these diverse countries took, over time, differing paths and evolved differently. But what is civil service reform? Why do countries undertake it? How do the civil service reform efforts undertaken by countries in Sub-Saharan Africa compare? What have been the effects of such reforms? The following pages offer answers to these questions.

## Perspectives on Civil Service Reform

Civil service reform has enjoyed great usage in public administration for quite some time. As such, it is defined differently. According to Caiden, civil service reform is a systemic improvement of the public sector functional performance. In his view, administrative reform aims at assessing government performance and predicting the general public's expectations of government. He argues that civil service reforms are needed to adapt government to the constantly changing needs of society and to enable public administration to reshape society. Caiden aptly views the process of reform as "visionary, radical, political, risky, contrived, planned, artificial, opposed, time-consuming, problematic, elusive – and more" (1991:1). Indeed, administrative reform is a complex phenomenon whose results are not always predictable and one that is often viewed as a means to an end, rather than an end in itself.

Civil service reform has been defined as "deliberate changes to the structures and processes of public sector organizations with the objective of getting them (in some sense) to run better" (Pollit and Bouckaert 2000:8). Reform efforts therefore serve multiple ends among them: reducing public expenditure, improving the quality of public services, and making government more efficient and effective. Haggard (1997) conceives of civil service reform as a process of rewriting the contract between elected politicians and bureaucratic officials. He views administrative reform as a political endeavor in terms of the political control of the bureaucracy and bureaucratic politics

theory. His views are in stark contrast with Woodrow Wilson's and Frank Goodnow's call for a politics/administration dichotomy. Indeed, in many developing countries, reforms are engineered by politicians albeit with a huge external push from the international financial institutions like the International Monetary Fund (IMF) and World Bank (WB).

Although administrative reform is not a new phenomenon, contemporary reform efforts are quite different from those in the nineteenth century. The contemporary reform efforts are more international in character and exhibit more political salience. In the 1980s, the WB facilitated many developing countries to implement SAPs. In Sub-Saharan Africa, the SAPs menu included devaluation of the currency, liberalization of the economy, privatization, decentralization, and civil service reform. These programs came as a response to fiscal constraints, and the Bank's primary concern was to reduce the size of the public service and the wage bill. In most countries, there have been attempts to reduce the role of the state in relation to the market, cut back the size of the civil service in both personnel numbers and expenditure, enhance accountability, and improve managerial efficiency.

Civil service reform can also be viewed from a governance perspective. The World Bank (1993) defines governance as the method through which power is exercised in the management of a country's political, economic, and social resources for development. While the WB for a long time focused on economic stabilization and state reforms that overwhelmingly emphasized civil service retrenchment and privatization, the early 1990s saw a change of focus. It was realized that most of the crises in developing countries were of a governance nature. Hence, the contemporary adjustment package emphasizes issues like transparency, accountability, and judicial reform, issues that are believed to enhance good governance.

There are three major categories of good governance: systemic, political, and administrative. Systemic governance entails the distribution of both internal and external political and economic power. Political governance is attained when a state enjoys both legitimacy and authority derived from a democratic mandate. Administrative governance refers to efficiency, openness, accountability, and audited public service (World Bank (1993). In the context of most developing countries, good governance signifies a governmental framework that functions in a responsible, accountable, and transparent manner. This framework should also be based upon the principles of efficiency, legitimacy, and consensus. The civil service reform programs that have been implemented in Sub-Saharan are pursued under the broader pursuit of good governance. Civil service reform is geared toward righting bureaucratic wrongs and governance helps achieve that goal.

Civil service reform can also be viewed from the NPM perspective. Arguably viewed as a paradigm shift in public administration, NPM is a global reform movement that redefines the relationship between government and society. NPM calls for a move away from traditional public administration to what is commonly known as the "new managerialism," "market-based public administration," and "entrepreneurial government." Spurred by citizen dissatisfaction with government performance, bureaucratic red tape, endemic fiscal problems, and seemingly successful restructuring in the private arena, calls for public sector reform, the abandonment of traditional public administration, and reinventing government became rampant. Initially espoused in Australia, New Zealand, the United Kingdom, and the USA, NPM is now a global phenomenon that calls on civil services to embrace ideas developed in the private sector to enhance effectiveness and efficiency, and adopt them in the public sector without adapting or changing them dramatically (Liegl 2001).

NPM emphasizes goals and results and gives private firms an exemplary role in public sector reform. Four focal areas are common to NPM reforms namely: restructuring and re-engineering of the internal administrative structures; the development of market-oriented strategies within the public sector; the emphasis of doing more with less; and the emphasis on mechanisms guaranteeing customer service. These four premises require the civil service to reform its culture, and be more flexible, innovative, problem solving,

entrepreneurial, and results oriented as opposed to being rule-bound, process-oriented, and focused on inputs (Rosenbloom et al. 2015). NPM urges the civil service to abandon its obsession with procedure and bureaucratic red tape and instead focus on responding efficiently to customers and achieving results. In the 1990s, Sub-Saharan African countries started implementing many of the NPM prescriptions including privatization, contracting out services, decentralization, and introduction of performance measurement systems.

## Civil Service Reforms in Sub-Saharan Africa

A wave of civil service reforms swept across many developing countries in the 1980s and reshaped the way public services are delivered, and the way public budgets are managed. In Sub-Saharan Africa, civil service reform efforts have been pursued with a mixture of great zeal and caution. Prior to colonialism, none of the African countries had any modern-day administrative or Weberian systems to boast of. However, the onset of colonialism brought with it western-style bureaucratic organizations to the colonies. The newly imposed administrative systems were mechanisms for control and subjugation rather than for serving the public interest and entrenching administrative ideals. As such, focus was placed on maintaining law and order, collecting taxes, and ensuring the colonial interests rather than training, developing, and creating viable administrative infrastructures manned by the African natives. The organization of the colonial administration was "highly hierarchical, inhibiting lower-level participation in decision making, and since it was in the service of the colonial masters, it was highly suppressive and did not respond to public demands" (Mutahaba et al. 1993:7).

The civil service and bureaucratic structures, principles, and values in Sub-Saharan African countries are rooted in the western bureaucratic systems. Correspondingly, the formal political institutions, principles, and processes that were introduced at independence were largely a duplication of the former colonial masters' systems. The first reform efforts therefore emerged just prior to independence to prepare the indigenous people for self-rule. The attainment of independence generated immense development expectations and increased responsibilities that demanded changes in the administrative processes, culture, orientation, and capabilities. Sub-Saharan African countries sought to reorient their civil service systems to be responsive to the development needs of the people. As a result, the Africanization policy was introduced by which native Africans replaced the Europeans and other foreigners. A Nigerian offered justification for the Africanization policy thus:

> The decision was taken by our leaders that the British officials should be replaced, not because they hated or distrusted them, but because they felt that political independence was a sham unless you had also a great measure of administrative independence. You just could not be politically independent and remain administratively dependent, over a long period, without misunderstanding and tensions arising between the expatriate administrator and his indigenous political master (Heady 2001:301).

Despite the Africanization program and numerous subsequent reforms, efficiency, effectiveness, accountability, and responsiveness were not attained. If anything, the efforts proved inappropriate and inadequate. The local cultural and sociopolitical factors exposed the western-derived administrative and political systems to tremendous challenges. Governments took on more than what they could handle, while a dismal economic and political performance made worse the already dire administrative conditions. As a result, the postindependence administrative systems of many African countries have been characterized by a bloated civil service, inadequate administrative capacity, limited financial and administrative resources, and a fragile political environment. The reform efforts articulated in the following pages were aimed at rectifying these problems. It can therefore be argued that Sub-Saharan Africa civil service systems were never complete replicas of their colonial masters' native systems because postindependence civil service systems did not adhere to western Weberian bureaucratic ideals. Lacking the administration/politics dichotomy,

patronage emerged. Public officials served their own interests and those of their kin rather than those of the public, and utilized public monies and equipment as personal property. Indeed, the quest for the current administrative reforms could be viewed as a chance at better adopting western administrative, bureaucratic, and political ideals.

Individually, the administrative systems in Sub-Saharan Africa have faced and have been shaped by differing circumstances. For instance, while Uganda's and Nigeria's administrative systems have been afflicted by many problematic colonial legacies and post-colonial failures common to most African countries, they have had a very deeply troubled and unique political and economic context that exacerbated the administrative pathologies. Both countries soon after independence were rocked by coups and counter coups resulting in immense political turmoil and economic collapse that derailed civil service performance. Tanzania, on the other hand, has not endured critical political strife and is considered one of the most stable nations in Africa. Instead, it is the country's ideological and economic predicament that put a strain on the civil service system. Therefore, civil service reforms are peculiar to each country depending on the local context, priorities of politicians, and administrative elite. Nonetheless, most of the Sub-Saharan African countries the contemporary second and third wave reforms initiated since the 1980s and 1990s respectively, have been quite uniform. They have been implemented in the framework of the World Bank's SAPs, and they have focused on four major issues: (1) reducing the size of the civil service, (2) pay reform, (3) enhancing capacity and performance of the civil service, and (4) improving ethics and accountability. The next section offers a comparative analysis of the implementation of these four major reform components.

### Reducing the Size of the Civil Service

One of the major goals of civil service reform undertaken by Sub-Saharan countries has been to reduce the size of the service. Considered bloated and highly centralized, the IMF and WB were quick to point out that the countries' fiscal problems would not be adequately addressed if the civil service wage bill was not reduced. Hence, reforms to reduce the cost of the civil service in general, and the wage bill in particular, were implemented in Ghana, Nigeria, Uganda, Tanzania, Zambia, and other countries. Such reforms included staff reduction (retrenchment); removal of "ghost workers"; halting new recruitments; encouraging early voluntary retirement; and devolving functions to the local government. One of the countries that has been hailed for implementing structural reforms to reduce the size of the civil service is Uganda. In 1990, Uganda's civil service comprised of 38 ministries and employed approximately 320,000 people. But after rigorous rationalization of ministries, retrenchment, purging of ghost workers, and decentralization of roles and functions to the local level, the civil service ministries were reduced to 17 while the overall size fell to 165,000 by 2006 (Kyarimpa 2009).

The reduction of the civil service size was successful in other countries too. The Ghanaian civil service that employed approximately 131,000 civil servants in 1987 was reduced to 79,000 by 1997 (Haruna 2001). In Ghana, reducing the size of the civil service entailed not only eliminating ghost workers and freezing recruitment, but identifying redundant and underemployed personnel for proper reassignment as well. In Nigeria, the federal civil service that was comprised of approximately 30,000 employees at independence had enlarged to 273,392 in 1990 (Otobo 1999). With the removal of ghost workers, retrenchment, and decentralization, the federal civil service staff was significantly reduced. Other nations like Benin, Tanzania, Senegal, and South Africa made significant reductions to their civil service staff and reduced the share of the wage bill in budgetary expenditure. In Rwanda and South Africa, decentralization decongested the center.

The impetus for the reducing the size of the civil service was to generate budgetary relief by shrinking the civil service wage bill. Yet, the reduction of staff numbers did not necessarily lead to general reduced fiscal stress in many of the countries. In fact, only meager positive results

were attained. In many cases, retrenchment targeted low-earning lower level staff thus producing only miniscule savings. In Nigeria, for instance, more than 70% of the federal civil service was composed of junior staff (Briggs 2007). In other cases, the retrenched staff found their way back into the civil service through the backdoor. Yet in some countries, the introduction and expansion of social services necessitated hiring more staff. A good example is Uganda, which introduced free primary education even as it was downsizing the civil service. Not surprisingly, the upsurge in the number of primary school children necessitated a significant increase in the number of teachers. It can therefore be asserted that determining the optimal size of the civil services in sub-Saharan Africa is still a major challenge. Moreover, rightsizing the civil service is not a panacea to performance deficit. To enhance civil service performance, the retained staff need to be well paid and offered a conducive working environment over time.

### Enhancing Civil Service Pay

To attract and retain qualified staff, countries in Sub-Saharan Africa have initiated many reforms aimed at enhancing the salaries and wages of their civil servants. At independence, many of these countries' remuneration packages were high but by the mid-1970s, the average basic salary had reduced by 30–40% (Robinson 1990). A combination of factors led to this decline in remuneration. At the international level, the oil shocks and global recession of the 1970s did not spare African countries' nascent economies. At the domestic level, many countries were experiencing political and social strife that exacerbated the economic depression. To cope with the turmoil and deteriorating civil service pay, many governments resorted to alternate forms of payment like stipends and in-kind benefits. In many cases, such systems were riddled with patronage and corruption. Not surprisingly, as the wages eroded and became highly compressed and working conditions degenerated, so did the morale and morals of the bureaucrats. Many fled their countries and went abroad seeking greener pastures while others resorted to unethical behaviors like embezzlement of public funds and misuse of public office.

The contemporary civil service reforms have therefore aimed at not only enhancing civil service pay, but attracting and retaining well trained and skilled personnel as well. The reforms have taken various forms. Governments have attempted to pay what came to be commonly known as a "minimum living wage" (MLW) (Uganda, Ghana, Tanzania). Others attempted to rationalize the pay and grading system (Ghana, Uganda) and enhanced the decompression ratio of the pay structure (Ghana, Uganda), while others formulated altogether a new incentive policy framework (Rwanda, South Africa). Some countries eliminated allowances and monetized non-cash benefits (Kenya, Uganda). Yet, some countries have not made major changes. Salary differentials between the highest and lowest among civil servants have not changed drastically in Benin, Burkina Faso and Senegal. In Uganda, salaries were increased by 43% across board in 1992, basic pay increased by 85% in 1993, and in 1994 a 37% wage bill increase was legislated (Kyarimpa 2009). While salaries of the Ugandan civil servants were initially significantly raised (for instance, a primary school teacher that earned US$4.00 in 1990 was earning US$ 70.00 in 1996), the wage bill was still only 1.2% of GDP and among the lowest in Africa (Langseth and Mugaju 1996) and not conducive to retaining a skilled workforce. Moreover, by 2000, pay reform had stagnated as political will and focus waned.

In many Sub-Saharan countries, salary increases have been offered via new pay policies, private sector benchmarking, formation of independent agencies, and by use of selective pay increases to those with critical skills. South Africa's New Incentive Policy Framework links pay increases to performance and has generated a positive impact. Performance-related pay has been attempted in Nigeria and Ghana but has so far failed to take root as performance evaluation designs remain inconsistent (Cooper-Enchia 2008). To date, major pay disparity exists among career civil servants, political appointees, and those that work in independent agencies in many

countries. In some cases, the gains made in the early phases of reform have been reversed or they have stagnated. In Benin, performance-related pay was heavily resisted by workers' unions, while in countries where pay reform depended largely on external support and savings from downsizing the service, continuity and consistence have proved difficult. Pay reforms in Ghana, Uganda, and Tanzania have stagnated or have been replaced by selective pay increases.

Ultimately, pay reform has proved to be a political issue as it is an economic one. In countries where the political leadership enjoys legitimacy, pay reform has tended to remain on track. Botswana, Seychelles, and to some extent South Africa are good examples. In countries where the political stability and legitimacy are tenuous, pay policies tend to be based on political calculations that reinforce regime survival. Nigeria, Ghana, and Uganda fit this scenario although the first two are tending towards stable political pluralism. To attract the best and brightest and to retain high-skilled workers, governments in Sub-Saharan Africa must have political stability and viable private economies to ensure a broader revenue base. So far, many countries have not reached this threshold.

## Enhancing Civil Service Capacity and Performance

Civil service capacity to perform and deliver public services has historically been poor in Sub-Saharan Africa. During colonial rule, the domestic public interest was ignored as colonial governments focused on extraction of resources. After independence, lacking a viable private sector, many governments assumed the role of provider of goods and services. But when political instability and economic depression ensued, the capacity of governments to adequately respond to public demands weakened and civil service performance plummeted. The reforms implemented in the 1990s were supposed to develop the capacity of the civil services to become efficient, effective, and responsive. Various programs were introduced, among them training and infrastructure development; performance improvement plans; client service charters; results oriented management (ROM); and information communication technology. In some countries, capacity development institutions and units to implement the civil service reform were formulated.

Training is important for continuous improvement and sustenance of competencies. Countries passed policy documents detailing training needs and goals. In South Africa, the White Paper on Public Service Training and Education of 1997 provided the framework for training and capacity building, while in Ghana it was the Civil Service Act of 1993. Uganda and Tanzania issued elaborate training policies. Various countries offered training in various areas including: leadership, customer care, information communication technology, records management, open performance review appraisal systems, and results-oriented management. In Uganda and Tanzania, civil service training colleges were established to offer training and refresher courses to civil servants.

Performance improvement programs have also been widely utilized. In 1995, Ghana launched the Ghana Civil Service Performance Improvement Programme (GCSPIP) to develop the capacity of the civil service to deliver efficient, economic, and customer-focused services. The program required ministries, departments, and agencies to formulate performance improvement plans that indicated service delivery standards, and performance agreements, and to establish a civil service complaints system. Program officials provided oversight visits and offered regular review meetings with relevant personnel. Modest success was achieved. While service delivery standards were formulated and performance agreements effected, they lacked consistent funding for implementation. Alas, the same scenario can be found in Uganda, Tanzania and Kenya. In South Africa, client service charters and citizen satisfaction surveys are utilized under the Batho Pele (People First) principles within the framework of the Public Administration Management Bill. Enhanced citizen involvement in the assessment of service delivery has led to improved civil service performance and responsiveness.

Overall, capacity building efforts have had success in training and professional development through performance improvement courses.

Without adequate funding, performance measurement tools have not been adequately implemented. A more holistic and multidimensional form of capacity building that includes value systems and beliefs, institutional and resource factors, and integrates ethics and public interest values in the frameworks might go a long way in producing capable public servants. Equally significant, adequate funding is critical for the effective application of performance enhancement and measurement tools.

### Improving Ethics and Accountability

Civil service reform programs in Sub-Saharan Africa focused on ethics and accountability because the two values are vital to efficient and effective service delivery. Because of the socioeconomic and political difficulties many of these countries endured soon after independence, civil services had a paucity of effective accountability mechanisms. Others had institutionalized corruption – Nigeria and Uganda are good examples. To curb unethical conduct, countries initiated many programs among them establishment of Ombudsman – Inspector General of Government (Uganda); Ethics and Integrity Departments (Ghana, Tanzania, Uganda); and Anti-corruption Bureaus and Agencies (Botswana, Ghana, Tanzania). Other initiatives include the formulation of Leadership Codes and Codes of Conduct (Rwanda, Tanzania, Uganda, South Africa).

Many of the anti-corruption agencies have regulatory, investigative, enforcement, prevention, and educational mandates. The Ghanaian Economic and Organized Crime Office, formed in 2010 (it replaced the Ghanaian Serious Fraud Office (SFO)), performs such mandates. The office, which has successfully prosecuted some high-profile cases, has so far managed to retain some degree of independence from elected officials, including the nation's executive (Transparency International 2010). In Tanzania, the Prevention of Corruption Bureau has prosecuted cases including one involving a government cabinet member (Kyarimpa 2009).

The implementation of Leadership Codes has generated varied results. In Tanzania, President Mkapa took the lead in declaring his assets. This sent the right message to government officials. Yet, enforcement is still a challenge especially because noncompliance is not met with serious ramifications. In Uganda, the office of the Inspector General of Government that is supposed to enforce the Leadership Code has been found to be ineffective and devoid of capacity to monitor and enforce the Code (Larbi 2007). In other countries like Malawi and Zambia, codes and anticorruption laws have not been consistently implemented because of inadequate funding. It should be noted that lack of funding and lack of personnel to adequately implement anticorruption measures plague almost all countries in Sub-Saharan Africa.

It can be asserted that despite efforts to enhance the ethical stance of civil servants, countries in Sub-Saharan Africa remain encumbered with high and low-level corruption and abuse of office. In South Africa, former president Jacob Zuma was embroiled in numerous corruption scandals until he was finally forced out of office. Mugabe of Zimbabwe met the same fate in 2017 after his regime was accused of gross corruption that destroyed the economy. Perhaps not surprisingly, many African countries consistently rank poorly in the Transparency Perception index and other corruption measurement tools.

## Conclusion

The discussion presented shows that countries in Sub-Sharan Africa have engaged in numerous reform programs to make their civil service systems lean, efficient, effective, and accountable. Because African civil service systems are rooted in the colonial systems of administration and some of the problems being faced are part of the colonial legacy, the challenges met by the postindependence governments have been numerous and very difficult. This is partly why initial postindependence administrative reform faltered. Yet postindependence governments too assume the blame for administrative dysfunction. To revamp their failing civil service systems, most nations turned to the IMF and WB for support. This entry contextualized the civil service reforms

in governance and NPM movements and showed that the IMF and WB played a major role in the formulation and implementation of various reforms.

A comparative assessment of the reforms undertaken by different countries illustrates how differing contexts generate diverse results. Modest success has been registered in civil service size reduction, although like in other countries, the optimal size is not agreed upon. Pay reform generated improvement in remuneration, but African civil servants still earn salaries that are below a living wage. Much work needs to be done to build capacity and enhance ethics and accountability. It can be concluded that civil service reforms are context-specific and must be implemented with that in mind. Financial resources and qualified personnel to implement the reforms are key to success. Finally, political will and political stability are important for sustenance and continuity of the reform programs.

# Comparative Concepts of Technology for Strategic Management

Mario Coccia
CNR–National Research Council of Italy, Torino, Italy
Yale University, New Haven, CT, USA

## Synonyms

Complex system; Nature of technology; Product architecture; Product modularity; Technical change; Technological change; Technological evolution; Technological innovation; Technology analysis

## Definition

Technology is a complex system, composed of more than one entity and a relationship that holds between each entity and at least one other entity in the system, to satisfy needs, achieve goals, and solve problems of adopters to take advantage of important opportunities or to cope with consequential environmental threats for purposes of adaptation and/or survival in highly differentiated and volatile environments.

## Introduction

Technology has manifold conceptions (Dosi 1988; Basalla 1988; Coccia 2015a, b, 2019a, b, d; Freeman and Soete 1987; Hosler 1994; Nelson and Winter 1982; Oswalt 1976; Utterback et al. 2020). Brey (2009) argues that general public knows *what* technology is and *how* it can support human activity. Technology is driven by *inventions* of new things that are transformed into usable *innovations* in society. Abernathy and Clark (1985, p. 4*ff*) state that:

> innovation is not a unified phenomenon: some innovations disrupt, destroy and make obsolete established competence; others refine and improve. Further, .... different kinds of innovation require different kinds of organizational environments and different managerial skills. ...An innovation is the initial market introduction of a new product or process whose design departs radically from past practice. It is derived from advances in science, and its introduction makes existing knowledge in that application obsolete. It creates new markets, supports freshly articulated user needs in the new functions it offers, and in practice demands new channels of distribution and aftermarket support.

Technology develops with different typologies of innovation given by: *incremental innovations* (progressive modifications of existing products and/or processes); *radical innovations* (a drastic changes of existing products/processes to satisfy needs or solve problems in society); *technological systems* (clusters of innovations that are technically and economically inter-related, e.g., biotechnology); and *technological revolutions* (pervasive changes in technology affecting many branches of the economy, such as Artificial Intelligence Technologies having technological dynamism and a pervasive use in a wide range of sectors; cf., Coccia 2020).

Hickman (2001, p. 183) claims that technology is: "the intelligent production of new tools, including conceptual and ideational ones, for dealing with problematic situations." Hosler (1994, p. 3, original italics) argues that technology, and its development, is influenced by "technical *choices*," which express economic, social, and political factors, and by "technical *requirements*" given by material properties. Instead, Bunge (1990, pp. 231–232) suggests that: "technology may be regarded as the field of knowledge concerned with designing artifacts and planning their realization, operation, adjustment, maintenance and monitoring in the light of scientific knowledge (an artifact can be a thing, ... or a process, and that it can be physical, chemical, biological, or social)". Volti (2009, p. 6) defines technology as: "a system created by humans that uses knowledge and organization to produce objects and techniques for the attainment of specific goals." Examples of technologies are laser, television, computer, etc. (cf., Carroll 2017, p. 6). Bigelow (1829) specifies that technology is: "principles, processes, and nomenclature of the more conspicuous arts, particularly those which involve applications of science, and which may be considered useful, by promoting the benefit of society, together with the emolument of those who pursue them." Arthur (2009, pp. 18–19) argues that: "technologies somehow must come into being as fresh combinations of what already exists." This combination of components and assemblies is organized into systems to some human purpose. In this context, Coccia (2019a, p. 293) claims that technology is a complex system, composed of more than one entity and a relationship that holds between each entity and at least one other entity in the system, to satisfy needs, achieve goals, and solve problems in society. Technology supports adopters to take advantage of important opportunities or to cope with consequential environmental threats for the purpose of adaptation and/or survival in highly differentiated and volatile environments (cf., Coccia 2005c, 2017, 2019b, c; Usher 1954). Sahal (1981) states that technology

has manifold dimensions, ranging from an object of material culture to an organized group of applied scientific knowledge. In general, technology is a central feature of the human nature and supports progress and civilization in society (cf., Hickman 2001; Pacey 1999).

## Concepts of Technology

The conception of technology has a vast literature that focuses on different characteristics (Coccia 2005a, b, 2006a; Coccia and Watts 2020). The main concepts of technology can be schematically summarized in Fig. 1.

### Economic Concept of Technology

Firms produce outputs from various combination of inputs. The set of all production plans is the set of production possibilities of firms. Varian (1984) describes the production of an output using two inputs (1 and 2) with two techniques as follows:

*Technique A*: 1 unit of good 1 and 2 units of good 2, it produces 1 unit of output
*Technique B*: 2 units of good 1 and 1 unit of good 2, it produces 1 unit of output

In this approach, technology can be represented with a function involving unknown parameters, such as the function of Cobb-Douglas that any input, such as capital $= K$ and labor $= L$, satisfies the condition that $K^a \cdot L^b \geq 1$ producing at least 1 unit of output ($a$ and $b$ are parameters). The parametric representations of technology are a convenient way to analyze the production choices of firms, using statistical methods for estimating the unknown parameters in models. The production function, in *neoclassical perspective of economics*, can be illustrated by convex isoquants representing different techniques in the production of same output (an *isoquant* is a curve that shows all combinations of inputs that yield the same level of output). The development of new techniques generates a shift toward the origin of isoquant. Hence, technological advances generate the same amount of production by a lesser amount of factors, such as capital and labor. In particular, technology can generate labor saving if it increases and capital saving if it decreases, the capital-labor ratio in the production of a given volume of output. However, heterogeneous inputs and outputs generate difficulty of measurement in the function of production (Salter 1969). An alternative approach to the neoclassical conception of production function, just mentioned, is given by Kaldor (1957) that proposes a technical progress function in which the growth of capital per man is associated with the growth of output per men at a given rate of change, rather than a given level of technical knowledge. Limitations of these approaches are that both technical progress function by Kaldor and production function by neoclassical economics do not isolate economic factors from technical ones. Another limitation, within these economic approaches, is the lack of a concept of technology *per se*.

### The Pythagorean Concept of Technology

The Pythagorean concept of technology is based on approaches of the history of science and technology (Sahal 1981; Schmookler 1966; Steil et al. 2002). The concept of technology and technological evolution here are a count of relevant events. The technical activity is measured with patent

**Comparative Concepts of Technology for Strategic Management, Fig. 1** Comparative concepts of technology

statistics and/or a timeline of major and minor inventions (cf., Jaffe and Trajtenberg 2002; Sahal 1981). The advantages of patent statistics are the availability of data. However, patented inventions do not provide information if a prototype is suitable for production and commercialization in markets (Coccia 2005c). In fact, patents may not consider the development of technology and that many inventions are not patented for various reasons, such as the inadequacy of patent protection, legal problems, etc. The alternative approach is the timeline of innovations, which assigns dates of occurrence to major and minor innovations of a technology (cf. Sahal 1981). However, this approach also lacks of a theoretical framework that distinguishes different types of innovation, such as incremental and radical innovation. Overall, then, this approach focuses on origin rather than development of technology (Coccia 2005b, 2006a, b).

### The Systems Concept of Technology

This approach focuses on functional characteristics of technology measured with a change of technical performance in products and/or processes (cf., Coccia 2005a, 2019a, c; Sahal 1981). This approach was applied to analyze the advances of military technology (Alexander and Nelson 1973; Martino 1985). In fact, functional measures of technology objectively measure the progress of technology, such as thermal efficiency of an electric power plant, fuel-consumption efficiency in horsepower hours per gallon in farm tractor, airspeed for aircrafts, etc. (Sahal 1981). The systems approach also evaluates major and minor innovations of technologies. For instance, in the case study of farm tractor technology the change of fuel-consumption efficiency can detect major innovations, such as the use of pneumatic tires, quality of fuels, and minor innovations, such as durable valve, piston, etc. Moreover, functional measures of technology can support engineering and managerial decisions to increase the efficiency of a technology and, as a consequence, competitive advantage of firms. However, systems concept of technology has also some limitations, such as data of functional characteristics of technology can be difficult to gather for some technologies and/or innovations (Coccia 2019a). Finally, this approach is better for micro rather than macro analyses of technology and technological change.

### A Systemic-Purposeful Conception of Technology

Coccia (2019a) proposes a purposeful perspective of technology.

> Technology is a complex system composed of more than one entity or sub-system and a relationship that holds between each entity and at least one other entity in the system. Technology satisfies needs, achieves goals, and solves problems of adopters (individuals/firms/etc.) for the purposes of adaptation and/or survival in turbulent environments. Technology changes current modes of cognition and action to enable makers and/or users to take advantage of important opportunities or to cope with consequential environmental threats.

Technology $T_1$ as a complex system is based on incremental and radical innovations (Fig. 2). Technological change is the progress of technology from a system $T_1$ to $T_2$, $T_i$, …., $T_n$ to solve consequential problems of adopters in volatile environments, turbulent markets, and changing societies (cf., Coccia 2015a, 2016a, b; Wagner and Rosen 2014; Ziman 2000).

Coccia (2019a, b, c; Coccia and Watts 2020) explains, within this approach, the evolution of technology considering a parasite-host relationship between technologies that generates the coevolution of overall complex system of technology: the so-called *theory of technological parasitism*. In particular, Coccia (2019a) argues that technologies have a behavior similar to parasites because technologies cannot survive and develop as independent systems *per se*, but they can function and evolve in markets *if and only if* they are associated with other technologies, such as audio headphones, wireless speakers, software apps, etc., can function if and only if they are associated with host or master electronic devices,

**Comparative Concepts of Technology for Strategic Management, Fig. 2** Technology, elements of technology (innovations) and technological change

such as smartphone, radio receiver, television, etc. In fact, a parasitic technology *P* in a host or master technology *H* is a technology that during its life cycle interacts and adapts into the complex system of *H*, generating coevolutionary processes to satisfy human needs and solve problems in society (cf., Coccia and Watts 2020).

General properties of technology within a purposeful perspective are:

1. *Property of not independence of any technological innovation*: the long-run behavior and evolution of any technological innovation T*i* is *not* independent from the behavior and evolution of the other technological innovations T*j*, $\forall i = 1, \ldots, n$ and $\forall j = 1, \ldots, m$ (cf., Coccia 2018a, 2019a, b, c).
2. *Property of mutual benefaction between interactive technologies*: the interaction between technologies reduces negative effects and favors positive effects directed to an evolution of reciprocal adaptations of technologies in volatile environments to satisfy needs and solve consequential problems of adopters (cf., Coccia 2019b, c).
3. Technological host *or* master with many parasitic technologies generates a rapid stepwise evolution of technological host-parasite system. Technological systems with fewer parasitic technologies and a low level of interaction with other technologies improve slowly (Coccia and Watts 2020).

## Conclusion and Managerial Implications

The conception of technology is one of the most troublesome and important issues in science. Conceptions of technology can support critical management implications:

- Economic concept of production function suggests that stability of product design and sources of new materials are needed to support technological progress, engineering improvements, etc. Management may achieve a volume production to be capable of sustaining long-term investments in new technology.
- The Pythagorean concept of technology can support policymakers about relevant factors at the origin of technology. In fact, this conception of technology can sustain innovation policy of governments that should direct R&D investments toward technologies having the perspective to advance rapidly, considering the growth of patents in specific fields of research, to sustain competitiveness and productivity of industries and of national economic system (Coccia 2018b, 2020).
- The systems concept of technology and purposeful perspective provide technical information at micro level for supporting competitive advantage of firms. For instance, these approach can support best practices for the advancement of product quality, improvement of product features, breaking of bottlenecks in

production, and development of process and product innovations that reduce scrap and increase yields. These perspectives suggest that good technical insights can foster close collaboration between product designers, process designers, and market planners in organizations. For instance, in construction industry, technological symbiosis between modular integrated construction and construction robotics can yield mutual benefits and support innovative building technologies (Yang et al. 2019; cf., Coccia and Watts 2020). The conceptual scheme of purposeful conception can also explain which technologies are likeliest to evolve rapidly. In particular, management, using these approaches, knows that host (or master) technologies with many interrelated parasitic technologies advance rapidly, whereas master technologies with fewer parasitic technologies improve slowly.

To conclude, the conception of technology is a complex topic still being revised and debated, and we have some way to go before we can say that we know why humans use tools and became so dependent on them. To resolve this scientific problem of clarifying the definition, domain, relations, and consequences of technology, we need input from varied scientific fields. We also need studies that aim to identify commonalities and differences for adopters between technologies in complex environments because of manifold ecological drivers, cognitive factors, or factors of social learning. Hence, identifying generalizable conceptions of technology that explain the role and relations of technology in society is a non-trivial scientific exercise. In fact, Wright (1997, p. 1562) properly claims that: "In the world of technological change, bounded rationality is the rule."

# Comparative Conservation Studies: A "Bottom-Up" Collaborative Governance

Emmanuel Yeboah-Assiamah[1], Kobus Muller[1] and Kwame Ameyaw Domfeh[2]
[1]School of Public Leadership, Stellenbosch University, Stellenbosch, South Africa
[2]Department of Public Administration and Health Services Management, University of Ghana Business School, Accra, Ghana

## Synonyms

Adaptive response; Champion; Collaborative governance; Institutions; Wildlife

## Definitions

***Collaborative Governance*** entails the new governance system that emphasizes on different stakeholders to prudently and methodically govern natural resources (Yeboah-Assiamah et al. 2016). In this entry, it connotes the creation of synergies between formal and informal governance structures as well as formal and informal institutions.

***Conservation*** is the appropriate management of a natural resource to avert its exploitation, annihilation, or degradation.

***Bottom up*** connotes strategies or activities that are initiated, propelled, and championed by either an individual, group of individuals, and groups within a local community before gaining subsequent formal or external recognition and support. It could also be an initiative of the entire local community through its legitimate leaders.

## Introduction

The complexity and high stakes associated with natural resources render them rather problematic and perhaps impossible to be governed by a single unit which has led to an era of networks and collaborations in natural resources governance (Yeboah-Assiamah et al. 2017). In other words, effective management of environmental resources including, inter alia, watersheds, and aquatic life, forests and wildlife, and protected areas requires the synergistic efforts of multiple actors and systems. The idea of collaboration has come to stay and is well researched in the natural resource governance literature (Yeboah-Assiamah et al. 2016).

An emerging theme has been a focus on the determinants or drivers of governance collaborations (Sayles and Baggio 2017); in other words, how do these governance networks and collaborations come about or get initiated? The role of a community's social capital base and how best communities deploy social capital greatly determines the extent to which resources get transformed into meaningful assets in a sustainable manner. Scholars discuss the role of bridging organizations in catalyzing such collaborations between various entities and stakeholders towards a superordinate goal of resource governance and conservation (see Kowalski and Jenkins 2015). Even within bridging organizations, there are still some "micro" entities that mastermind or catalyze the success of a bridging organization in bringing about natural resource collaboration for effective conservation purposes. For instance, Olsson et al. (2007) suggest the unique and "championing" role played by a director of the Ecomuseum [bridging organization] in establishing the collaborative governance arrangement of the Kristianstads Vattenrike Biosphere Reserve in Sweden. In Canada, collaborative governance in the lobster fishery of Maine largely involved the role played an individual [the Marine Resource Commissioner] who used his position as editor of Commercial Fisheries News and networks within the fishing space to propel the collaboration.

Although collaboration in the natural resource governance context has gained much prominence, the literature appears quiescent on the peculiar and championing roles exhibited by individuals [herein referred to as "champions"] in a particular

natural resource collaboration or resource outcomes. "Champions of change" are "innovative, charismatic individuals and can be found at any level of society, within local or national governments, NGOs, local communities, and among resource users" (Borrini-Feyerabend et al. 2004, p. 336). The literature contends that although leadership is critical to the emergence and effectiveness of shadow networks, it nonetheless does not necessarily lead to an improved governance of social-ecological systems (Olsson et al. 2006). Olsson et al pose critical questions including inter alia, "What characterizes the particular type of leadership that can transform an SES [social-ecological systems] towards adaptive governance? This current study contends that natural resource endowments are largely freely supplied by nature to "lucky" communities, yet the ability to transform such endowments into meaningful resource outcomes are context dependent. There are many communities blessed with specialized natural resources which yet have not been transformed into sustainable developmental resource for society, while in some, same resources have rather become counter-productive or exploited into extinction. From the foregoing, the study remarks that nature supplies freely, yet the underpinning challenge is: *Who, How, and What determines When it becomes sustainable developmental resource?* This entry makes an empirical contribution to literature by discussing the peculiar role of "champions" in forging collaborative wildlife governance for effective conservation as well as the roles and strategies in the transformation of a community endowment into a sustainable developmental resource. A champion is used in this entry to mean *an individual who through specialized organizing skills and interests undertakes interacted actions through rigorous approach and strategies to link differing bodies unto a coherent platform, to foster arrangements towards the effective governance of natural resources*. The study presents a case study of Boabeng-Fiema Monkey Sanctuary (BFMS) where the actions of "a champion" [the late Mr. Akowuah] resulted in collaborative wildlife governance which has helped in the conservation of a hitherto threatened monkey species which were on the brink of near extinction (see Yeboah-Assiamah et al. 2017). The BFMS in Ghana has subsequently become a renowned wildlife area of attraction to local and international tourists, development agencies, and researchers with associated society-wide benefits.

## Conceptual Overview

### Social Capital and Natural Resource Development

If society A, B, and C are given same amount of natural resource endowment($x$), the ability of A, B, or C to optimally adopt prudent measures to transform($x$) into a long-term blessing or asset greatly depends on the social capital the society possesses. The notion of social capital suggests that individuals, groups, one's family, friends, and associates constitute an important asset that can be called upon in periods of critical needs (Putnam 1993). A great deal of the social capital literature has been underscored by Putnam's (1993) work on civic participation and institutional performance where he conceptualized social capital to mean the "features of social organization, such as networks, norms, and social trust that facilitate coordination and cooperation for mutual benefit" (1993, p. 6). One could reason out that Putnam's treatise took great cue from Bourdieu (1986) who conceptualized social capital as "the aggregate of the actual or potential resources which are linked to the possession of a durable network of more or less institutionalized relationships of mutual acquaintance or recognition" (p. 248). Broadening the scope, Coleman (1990) discusses social capital by focusing on the "relations among groups" and "not just individuals." Arguing from its functional role, Coleman defines social capital as "a variety of different entities [which] all consist of some aspect of social structure, and [which] facilitate certain actions of actors...within the structure" (p. 598). At the macrolevel, social capital is explained as a process of drawing on the social and political environment to shape the social structure which also enables norms to develop (Olson 1982). In a snapshot, social capital connotes *individuals as assets, their close*

*relations, interactions among groups as well as socio-political imperatives*.

Relating the above conceptualization to this study, the individual who championed the purposive course of actions to salvage the threatened wildlife species including the steps to make the wildlife human-friendly constituted great social capital to the Boabeng-Fiema community. At the micro- and mesolevels, his immediate family and his former school pupils who mostly formed the youth supported his conservation efforts. At the macrolevel, he drew upon the relevant societal actors including opinion leaders, government officials and researchers from abroad which greatly contributed to revamping "hitherto threatened monkeys" into more "human-friendly" species becoming the community's greatest asset fostering socio-economic development. In essence, effective conservation requires the ability to use social capital to foster the appropriate social-ecological system and resilience. The concept of resilience implies the ability of governance regimes to make use of social capital, or other relevant resources to respond and adjust effectively to changing social-ecological systems, and thus be able to moderate or prevent the adverse effect that similar threats may pose to less-adaptive and less-resilient social-ecological systems.

## Methods

This entry adopted an ethnographic design. Ethnography is an interpretive approach where researchers task themselves to undertake a systematic discourse of the beliefs, processes, social interactions, and behaviors including peculiar phenomena of sizeable societies; the process is largely interspersed with participation and observation over a period of time (Denzin and Lincoln 2011; Reeves et al. 2008). The overarching goal of this design is an exploration, description, and explanation of other cultures and contextual phenomena and not to test for quantitative hypothesis (Atkinson and Hammersley 1994). The study was positioned within a prevalent epistemology by recognizing the information and knowledge base of participants. A key asset that enabled the study was the use of social relationships and intermediaries to seek unreserved access to key participants. According to Wilson (2008), ethnographic design requires "...the proper protocol for building of healthy relationships...the use of intermediaries has practical uses in establishing rapport with research participants and placing the researcher within a circle of relations" (p. 129). Consequently, two elder sons of the late Akowuah [one is a tour guard] remained very useful throughout the study period who led the researchers to participants including the chiefs, traditional priests, and other relevant actors. The purposive and snowball sampling techniques were used to identify 25 key informants who were deemed to have the requisite information. The main instruments of primary data gathering involved informal discussions, narrative enquiry, in-depth interviews, simulation exercises, and direct observations. Key individuals in the governance structure of BFMS as well as those who used to be closer to the "champion" when he was alive, including his wife, were engaged in a narrative inquiry followed by an in-depth interview. By direct observation and simulation exercises, the authors tied bananas to a wooden structure where "the champion" used to feed monkeys; in the presence of the authors, monkeys came around to pick up the bananas and photos were taken (see Fig. 3). The study also witnessed how researchers and tourists from both local and international arena visited the BFMS (Fig. 4). All the visuals in the study were taken in the course of this study between the 2016 and 2017 period. In ethnographic descriptions and discussions, visuals are deemed to be critical in the data analysis process. According to Denzin and Lincoln (2011), the use of visuals or images is quite relevant as it helps to get readers' attention; it is able to explicate an idea or phenomenon quite complicated to describe with words. Prosser succinctly puts "art can describe, reflect, and evoke emotion, which dry facts or figures and cool logic rarely do" (quoted in Denzin and Lincoln 2011, p. 488). All proceedings with participants have been transcribed and sorted out into

appropriate themes and used in the discussions. Data were analyzed using inductive thematic analysis based on issues emergent from the observations and data gathered as common to ethnographic studies (Reeves et al. 2008). Direct narratives and visuals have been used to support the themes discussed. A major strength of this design is that through observations and immersing oneself into the society, the researchers were able to identity and gather novel empirical insights which have eluded previous studies. More importantly, the comprehensive nature of the approach helped researchers to explore and link social phenomenon and related narratives which prima facie may appear to have no interlinkage (see Reeves et al. 2008).

## Study Context

Providing an empirical case of "a hitherto nearly institutional dearth and monkey species on the brink of extinction," this entry uses the unique case of Boabeng-Fiema Monkey Sanctuary (herein BFMS) in Ghana, West Africa, to demonstrate how "champions of change" could influence social-ecological systems. Boabeng-Fiema comprises two neighboring communities, both Boabeng and Fiema [who have similar beliefs and practices, *albeit* with subtle intercommunity rancor]. This community is located 22 km north of Nkoranza District of the Brong Ahafo Region [transitional zone of Ghana] which is about 230 km from Accra, the capital of Ghana. The area presents a distinctive case because the monkeys in the community in spite of challenges posed to community members continue to receive significant protection; the widely recorded human-wildlife conflict with wildlife becoming threatened in contemporary times is nonexistent in BFMS. Meanwhile, there have been periods the monkey species in BFMS were once threatened which saw the emergence of a "champion of change" who through pragmatic strategies brought about adaptive governance and institutional development towards collaboration for wildlife resilience. (details in section 4.1).

## Results and Discussion

In this section, the study provides a brief overview of BFMS and how the role of a champion fostered a bottom-up governance collaboration towards effective wildlife conservation.

**Overview of Emergence of Champion in BFMS (Source: From Fieldwork 2016 and 2017)**

Boabeng and Fiema are two neighboring communities that are surrounded by forest which contains *mona and colobus* monkey species which in contemporary times have become more or less "domestic animals" as mona monkeys are always seen in the homes and surroundings of Boabeng-Fiema, especially, in the mornings and evenings for dietary supplements. The traditional belief system had declared monkeys in Boabeng-Fiema communities as totems or the "offspring" of two gods "*daworo*" and "*abodwo*" in the Boabeng-Fiema, respectively and hence their conservation. Consequently, people had lived with monkeys harmoniously without any form of human "crime" against the monkeys since the 1830s. People had beliefs in the taboo and were made to believe that if they harmed the monkeys, disastrous consequence would befall them. However, upon the encounter with Christianity, some sections of the community began hunting for monkeys including massive destruction of the forest that inhabits them. The nature of the hunting nearly reached a crisis point destabilizing traditional conservation efforts and purposes which made one Mr. Daniel Akowuah (late), a native of the community rise up as "a champion of change." But for his intervention and the unique strategies embarked upon, the monkeys and their habitat would have perhaps become extinct or perhaps the remaining patchy monkeys being very hostile to

(continued)

human beings as observed in other contexts. The late Akowuah was a retired police officer and a then headmaster of Fiema Primary School [in the local community] who upon recognizing the potential conservation benefits inherent in the monkeys and the rate of their depletion took varying steps to salvage the situation including *lobbying and proposals writing, community sensitization, afforestation and taming of monkeys, and personal commitment to direct monitoring*. These interlinked activities (Fig. 1 below) have today made BFMS a renowned center of attraction to both researchers and tourists from across the world, a research hub for many local and international universities which helps generate income for society's developmental efforts.

Below discusses the key strategies adopted by the "champion of change" which underscored the governance and institutional rejuvenation capable of effective conservation of hitherto threatened monkey species in Boabeng-Fiema. Additionally, strategies adopted by "the champion" to make monkeys much domesticated and more human-friendly which attracts tourists from world over are discussed in the section.

### Proposals Writing to be Given a Sanctuary Status

Although the people of Boabeng-Fiema had seen monkeys in their forests and farms, they did not envisage the economic and ecological value except they were protecting it for their gods which had ordered them to do so. Largely a rural community, the people became helpless when their very beliefs became challenged as a result of being exposed to Christianity which undermined the value of the gods' commandment of "don't kill monkeys." The Savior Church had converts in the community who decided to hunt and use monkeys for their subsistence living. A then retired policeman and headmaster of Fiema School, Mr. Daniel Akowuah [whose house stands very close to the forest, see Fig. 2] took upon himself to bring to the attention of national policy makers "the beauty and potentials of monkeys" in the Boabeng-Fiema communities. This was in the 1960s when he wrote series of proposals to the then Department of Game and Wildlife. The efforts yielded results which made the department send evaluators to assess the possibility of earmarking the area as a national park. However, because the Boabeng-Fiema community is largely surrounded by the forest harboring the monkeys coupled with land-size issues, it would have been difficult to resettle the people; the place, however, got officially declared a sanctuary in early 1970s and the National Game and Wildlife Agency was to provide resident officials to patrol the forest [habitat of monkeys] and also to ensure wildlife laws were not violated. In effect, the governance was to become more collaborative between the community leaders [informal institutions] on the one hand and the state agency [formal institutions] on the other hand. This is what the study refers to as "bottom-up" approach to collaborative governance as the initial process towards the collaboration and conservation was kick-started by an individual and with local efforts. Consequently, the wildlife has become largely untouchable by dictates of the gods and national policies; the latter was largely the efforts and role played the "champion of change." A traditional priest explained:

> *. . .Akowuah was fortunate to be highly educated to become a senior policeman, my uncle* [the then priest] *told him, Kwaku* [Akowuah] *you have been in government, how can we salvage the animals from such destruction? Akowuah wrote series of letters to government which saw wildlife officials coming on board*

### Continuous Lobbying at Local Level

His efforts did not only stop at the national level, after achieving the target of sanctuary status and government declaring BFMS monkeys as protected species, he later persuaded the local district council [then Nkoranza District Council] which saw to a passage of by-law in 1972 that sought to further provide localized regulations to protect monkeys and the habitat. Consequently, there is

**Comparative Conservation Studies: A "Bottom-Up" Collaborative Governance, Fig. 1** Schematic view of measures by the champion (Source: Designed from field results).

**Comparative Conservation Studies: A "Bottom-Up" Collaborative Governance, Fig. 2** Location of Mr. Akowuah's house in relation to the forest.

a hunting and farming ban in the core forest. People can only farm at an available area clearly removed from the core forest demarcated by a buffer region. Therefore, the colobus and mona monkeys in Boabeng-Fiema are protected by national regulations, local by-laws, and traditional beliefs. In a discussion with a traditional ruler, he explained:

> *He [Akowuah] saw to it that the right institutions and regulations were passed to protect the monkeys, even the passage of the bye laws, I cannot take it away from him. He had a bit of education and knew the tourism potential that monkeys could provide.*

The champion's initial action of getting the right institutions passed was a worthwhile course of action as championing natural resources governance and conservation cannot be achieved without the enabling or supporting rules, regulations, and structures [institutional underpinnings] especially regarding protected areas (Hayes 2006). For instance, through the effort, the Wildlife Conservation Regulation (1971) of Ghana lists the colobus and mona monkeys [found in Boabeng-Fiema] as wholly protected [see schedule 1] and partially protected [see schedule 2], respectively; these have been strengthened by local by-law such as that of 1972 – proscribing hunting of monkeys, farming in the core forest – which are localized instruments to enhance wildlife conservation.

### Anchoring Collaboration Towards Effective Wildlife Governance

The champion anchored or fostered a management that sought to bring on board relevant stakeholders to collectively plan and execute for the governance and conservation of monkeys. In other words, he created a platform for the district secretary, chiefs, and elders in the resource community where proposals and resolutions were reached to construct a firebreak around the sanctuary. Given support, he personally planted teak trees [sometimes with the help of his former school pupils and many of his associates] along the edges of the sanctuary which have today grown into bigger trees largely used by monkeys for swinging. One elderly woman who is habited closer to Akowuah's house explained:

> *It was this man who because of his education and ability to communicate wrote letters to government… he did not sleep afterwards, he also planted a lot of teak trees along the sanctuary with his school youth so that the animals can be jumping on them….*

Scholars (Gray 1989) argue that a convener or champion should be able to identify and bring all legitimate parties to the negotiation arena; such "champion" requires a convening power [ability to lobby actors to get involved] which could be based on, inter alia, the person's formal position in society, the reputation of the convener. From the study, the educational status, social standing and reputation of the champion helped him a lot to be able to induce actors unto a platform for collective actions.

### Personal Commitment

The interest and enthusiasm in the process of conservation and wildlife development made Akowuah retire from his teaching profession in 1975 to take full control of the Boabeng-Fiema Monkey Sanctuary as the first warden. This point was contended by a traditional chief who succinctly narrated:

> *Akowuah started the sanctuary all by himself, although the monkeys were prevalent already [offspring of the gods], he took upon himself to remake the monkeys more human-friendly and to make people develop interest in them too. It is his initiative that the place became a recognized sanctuary…*

His tenure as the warden made BFMS attractive to the international world where he helped expose the sanctuary to international organizations and researchers who developed interest in the flora and fauna of the community. For instance, in 1989, he invited a Canadian lecturer [Fargey] who came with his team of students to carry out research on the monkey species. It was this Canadian scholar who suggested to Mr. Akowuah the need to establish a formal management committee to help manage the BFMS. By inviting Fargey to come and research in the area, it opened up the BFMS to the international community and larger exposure. Fargey has been one of the classical scholars who have written extensively on BFMS making the place well projected world over and its

status as an attractive research hub for many universities especially outside Africa who use BFMS for their field work.

In a discussion with one of the priests, he explained:

> *. . .history has it he discovered the animals. But what actually happened was some white men came and those days, people were afraid of the whites...So the community agreed that Mr. Akowuah joins the white men and he worked very hard.*

Whichever way one wants to put it, the champion of change was pivotal in the initiation, in the process, and its subsequent development.

A respondent who was with Mr. Akowuah narrated:

> *Akowuah adopted several strategies to draw the animals closer home and to human beings. Because he had taught before, he commanded a lot of respect and had most of the youth behind him. These youth helped him a lot to even go on night patrols; each time he heard of gunshot in the forest, even if he were asleep, would wake up and move with his team of volunteers in different directions. They caused the arrest of many people.*

From the foregoing, one could observe that aside his enthusiasm and personal commitment, social capital and networks played key role in the success of the champion. His relations with his family and the teaming youth contributed immensely to most of the strategies he adopted. This observation provides support to an assertion by Ostrom and Ahn (2009) that social capital serves as a social relationship asset which has potential to engender anticipatory or future benefits to a community or a process. In this regard, social capital contributed to the Boabeng-Fiema community as well as Mr. Akowuah's processes of preventing hunting of monkey species.

### Appropriate Steps to Domesticate the Wildlife

Largely because the monkeys had been threatened and hunted by some sections of the community, they had become very afraid of humans and wouldn't come close to humans or their homes. However, Mr. Akowuah used pragmatic steps to reorient the monkeys and to tame them. Today, when tourists visit BFMS, a significant and wonderful phenomenon they observe is monkeys moving in and around the houses of people; this has been the result of some actions systematically and rationally orchestrated by the first warden [Akowuah]. A respondent very close to Akowuah who witnessed and participated in these explained:

> *Akowuah would buy banana* [preferred food of monkeys] *and place along the routes of monkeys closer to the forest. The monkeys would come along to pick these bananas, next time he would place it a bit closer and closer till it got to a time the bananas were placed very closer to the home. These monkeys through that action got closer home without fears. Because our house was close to the forest, it was quite easier to do this* (See Fig. 2)

In the process, he was actively supported by his family [social capital] who helped in either conveying logs of wood to construct benches to accommodate people or seedlings to plant along the sanctuary. In the domestication of the monkeys, a close associate of Akowuah explained:

> *One of my daughters would put bananas on her laps and the monkeys would jump and pick. He made one of our sons convey logs from nearby village to construct some structures purposely for feeding monkeys. It was because of the monkeys that he made this structure* [pointing to a wooden frame linking the pillars of the house]. *He tied a rope with bananas along the bar; when these bananas get ripened, monkeys would come, pluck and eat. By and large, they kept trooping to the house and other households in their numbers.* (See Fig. 3)

The idea of social connections and networks was very instrumental in the entire process as the champion tapped the strength, assistance, and resources of many individuals, experts and interested parties who also helped in the wildlife governance, institutional development, and general protection which would have been very difficult for him to exclusively act alone (see also Yamaki 2016, on role of social networks). In our data-gathering process, a queen mother had this to say:

> *There was a white researcher who set a machine and placed all kinds of foods behind Mr Akowuah's house for some months.. that sought to train them* [the monkeys]. . ..*There was one Mrs Sackey who helped in the process. . . Today they [monkeys] do not fear guns, if they see you with a gun, they won't be moved. . ..*

By and large, the timely intervention and pragmatic undertakings by Mr. Akowuah which garnered *micro-, meso-, and macro support* helped

**Comparative Conservation Studies: A "Bottom-Up" Collaborative Governance, Fig. 3** The wooden structure designed by Mr. Akowuah to put monkey feed (Banana and rope tied by authors to simulate) (Banana and rope tied by authors to simulate).

develop Boabeng-Fiema Monkey Sanctuary into sustainable developmental resource for the Boabeng-Fiema community. In the discussion, a traditional chief suggested that nature could provide people or community with an endowment but it takes "champions" to develop such natural endowment into a valuable resource or community-wide asset. He remarked:

> *· · · the monkeys were prevalent, you would see them swinging on the trees when going to the farm. He* [Akowuah] *saw to it that the right institutions and regulations were passed to protect the monkeys, even the passage of the by laws, I cannot take it away from him. He had a bit of education and knew the tourism potential that monkeys could provide.*

Monkeys in BFMS have consequently become more human-friendly attracting researchers and tourists from across the globe which exposes the community to many socio-economic opportunities (see Figs. 4, 5, and 6).

## Public Education and Sensitization

Mr. Akowuah took upon himself to educate the people on the need to accommodate and protect the monkeys as they could have economic benefits for the community. This he did by moving from one church [major threat to monkeys at the time] to the other to have talks with the people. A key respondent explained:

> *To sensitize the church people, he himself converted to become a member of Savior Church but had intention to educate and to make them to understand why they should not hunt or destroy the beauty of the wildlife. With time, he was able to convince them, once that mission got accomplished he discontinued attending that church.*

The role of social education to get people adopt appreciable environmental conservation attitude cannot be overemphasized even where there are formal or informal rules in place. In this BFMS case, the approach adopted by the "champion" helped each of the partners [champion and the Savior Church] to understand each other's perspectives and also to learn from different knowledge bases; through that he was able to explain to them the community-wide benefit that could be associated with the monkeys if conserved well. Wheatly (1992) explains that although such

public sensitization effort may not completely curtail the problem, it can considerably reduce the threats to conservation efforts (cited in Borrini-Feyerabend et al. 2004).

### Championing Conservation Efforts: A Challenging Yet Worthwhile Activity

Finally, it should be noted that a decision to champion a natural resource conservation process comes with some form of confrontations or sentiments from people. However, it is essential for one to remain focused and stay committed to the course of action. The "champion" in this case faced some challenges as most of the people appeared ignorant of what he was trying to achieve. This was explained by a traditional ruler who made this submission:

> *Even nananom* [traditional rulers and elders] *appeared not to really understand or appreciate his actions and initiatives at the time. There was a time he was summoned before the paramount chief of Nkoranza but nananom at the time did not really rally behind him.*

Another participant explained a price the champion had to pay for promoting or facilitating the domestication of monkey. She submitted:

> *There was even one man whose kenkey* [local food made of maize] *was eaten by a monkey and he rushed Mr Akowuah for money to replace the kenkey and his argument was that it was Mr Akowuah encouraging the animals to come home*

In spite of the apparent challenges, the "champion" remained steadfast in his commitment and today the monkeys in Boabeng-Fiema have received international exposure attracting

**Comparative Conservation Studies: A "Bottom-Up" Collaborative Governance, Fig. 4** Human-friendly monkeys attract researchers and tourists to BFMS.

researchers and tourists from every part of Ghana and abroad generating income for the community through a stipulated benefit sharing system (see Eshun and Tonto 2014). To that end, the conservation efforts of and strategies by Mr. Akowuah – the champion – has helped transform the community's natural endowment into a community-wide sustainable and valuable asset, a major source of income, development, and prestige to the Boabeng-Fiema community (Figs. 4, 5, and 6; see also Eshun and Tonto 2014). It is in recognition of the champion's [Akowuah] efforts that the main trail that leads to the sanctuary is named after him; it is the first trail any visitor glimpses an eye on (Fig. 2).

## Conclusions and Policy Implications

The case study provides evidence that human actions towards nature could engender appropriate natural resource outcomes and preferred behavioral changes which would yield benefit to society. From the discussion, the study draws the following key conclusions:

Firstly, the role of individuals and leadership remains a cornerstone in natural resource governance. Within the developed institutional and governance set up, the championing roles of unique individuals remain phenomenal and the catalyst in such processes. Individuals as students, researchers, or community members could initiate a process which could lead to the transformation of a redundant or exploited natural endowment into a sustainable resource or asset. In other words, the interrelated set of actions and strategies could lead to a paradigm shift in how people conceptualize and relate to a particular resource as well as the kind of benefits it would generate to community members.

Secondly, transforming community natural supply [such as river, wildlife, trees, mountains, waterfall] from just being a natural endowment to a developmental resource and community asset requires a championing role of individual(s) who

**Comparative Conservation Studies: A "Bottom-Up" Collaborative Governance, Fig. 5** School children, pastoral wives, and international researchers in BFMS.

**Comparative Conservation Studies: A "Bottom-Up" Collaborative Governance, Fig. 6** Friendly "domestic monkeys".

garner(s) support of others to catalyze or call for external support to achieve such purpose. More related, the study contends that a given natural resource endowment in one community could remain idle or even destroyed, while same endowment could be utilized as a developmental resource in another society because of contextual differences (see Estrada et al. 2017).

Thirdly, the study observes that it does not necessarily require the legitimate authority or the state to kick-start conservation or collaborative arrangements towards effective natural resource governance. Concerned individuals and groups could adapt some of the strategies used by the champion in this case study to contextualize. The study contends that initiating and championing a particular course of action requires interrelated set of activities which need to be done tactfully including immersing oneself in the community's social ways so as to win their trust (see also Yeboah-Assiamah et al. 2016). In the case of Mr. Akwouah [the champion], he had to attend the Savior Church not because he wished but had the objective of using the platform to reorient the church members to stop hunting and haunting monkeys.

Finally, a major postulation of this entry is to reorient readers [researchers, students, advocates, and policy makers] that it could take the action of individual, group of individuals to champion a particular course that could provide future benefits with respect to how a given community endowment turns out to be a developmental resource. The study argues that the direction of pedagogy should also seek to reorient students or rural communities [targeting influential ones] on how best they could initiate some context-specific actions that could spark up a debate on how best a more or less redundant or exploited resource endowment could be transformed into a sustainable asset, well conserved while providing greater value to society, powered by appropriate governance structures and institutional underpinning.

# Comparative Critical Decisions in Management

Mario Coccia
CNR – National Research Council of Italy, Torino, Italy

## Synonyms

Bounded rationality; Crisis management; Decision rule; Decision-making; Hazards and risks; Improvisation; Problem-solving; Risk management; Strategic change; Strategic management; Strategies

## Definition

Critical decisions are an attempt to apply efficient modes of cognition and action to enable the organizations/individuals to cope with consequential

environmental threats or take advantage of important opportunities in the presence of highly restricted time in turbulent situations of emergency.

## Introduction

The markets and environment have, more and more, a growing dynamism that generates uncertainty, turbulence and in cases of emergencies, such as COVID-19 (Johnson and Scholes 1988; Emery and Trist 1965; Coccia 2020, 2020a, 2021, 2021a). In uncertain and unstable environments, organizations/nations are open systems having activities in interaction with external factors (McDermott and Taylor 1982; Gioia and Chittipeddi 1991; Coccia 2020a). Organizations/nations can confront crises and/or problematic situations that they do not face on a daily basis – for example, in the presence of hurricane, earthquake, political instability, pandemic, terroristic attack, financial crisis, etc. (cf., Ardito et al. 2021; Farazmand 2001, 2007; Coccia 2020a, 2021a). Critical decisions are hard calls, which involve trade-offs and/or also major changes, such as stop the production, apply lockdown in the presence of epidemics, quarantine of population, social restrictions, staff cuts, move the location of firms in other geoeconomic regions, etc. (Coccia 2020a, 2021, 2021a). In short, organizations/nations in emergency situations have to take critical decisions to cope with consequential environmental threats in the presence of highly restricted time, endeavoring whenever possible to minimize possible losses for a worst-case scenario (Coccia 2020a, 2021a). In general, a critical and effective decision requires interagency and interorganizational coordination (Coccia 2020a). Moreover, the effective implementation of critical decisions requires that personnel of different departments work together. In this context, public organizations are originally designed to conduct routine businesses in accordance with values of fairness, lawfulness, and efficiency. However, critical decisions in the presence of a crisis, hazards and/or risks to public health and to the environment, etc. require flexibility, improvisation, and the breaking of rules in a very short time (cf., Ardito et al. 2021).

## Typologies of Crisis and Risks for Applying Critical Decisions

A critical decision has the purpose to solve and/or constrain the effects of a crisis or hazardous situation that generate unexpected complex problems that threats individuals, organizations, countries, or societies at risk and with high vulnerability (Farazmand 2001; Coccia 2020). A general definition of risk is a performance variance or environmental threat that negatively impacts the individual/organization/nation/society (cf., Bouchet et al. 2018, p. 10). The sources of crises or hazardous situations can originate either internally or externally to organizations/nations. If organizations/nations do not find a timely solution, and sources of risk are left unaddressed, they can permanently damage the business, public service, organization, population, and society with consequential socioeconomic and public health problems. The identification of a crisis needs the evaluation of vital elements, such as: (a) the problem must pose an imminent threat to the individual/organization/nation; (b) the situation must involve an element of surprise or shock; and (c) unexpected and uncertain nature of a complex problem will place pressure on organizations/individuals (and in general a society) to make timely and effective critical decisions. Crisis for organizations can be due to manifold factors, such as: rapid evolution of technology (Coccia 2005b, 2005c, 2006, 2014, 2017a, 2017b, 2017f, 2018e, 2018f, 2019a, 2019e, 2020b, 2020c, 2020d, 2020e; Coccia and Watts 2020); natural disasters, such as earthquake, hurricane, flood, etc. pandemics and/or epidemics, etc., that generate socioeconomic shock and severe public health and social damages (cf., Coccia 2017e); as well as economic crisis generated by hyperinflation, high public debt, energy shortages, etc. (cf., Coccia 2005a, 2007, 2010, 2016; Coccia 2017c); political risk and revolutions (cf., Coccia 2017d, 2019a, 2019b, b, c; Farazmand 2001; Miller 1992); terrorism of some group organized that has technical skills to carry out a terrorist action directed to challenge a nation's authority and induce fear and anxiety into civilian population,

etc. (cf., Crenshaw 1981; Coccia 2018a, 2018b, b, c; Krueger 2007; Newman 2006). The effect of crises can be worsened by weak infrastructure and inefficiencies of local and national institutions/organizations and low capacity of planning in society.

## Crisis Management and Types of Critical Decisions

Organizations/nations can invest in strategic sectors, design a crisis management team for managing strenuous situations and complex problems and supporting critical decisions to resolve, as far as possible, them (Coccia 2019f, 2020a). Crisis management team should deal with threats before, during, and after they have occurred (cf., Groh 2014). Successful crisis management teams understand the different types of crisis and are thoroughly prepared for all hazardous situations. Moreover, in a crisis, leaders are expected to reduce uncertainty and provide an authoritative account of problems, solutions, and difficulties. When leaders have to formulate a strategy of critical decision for complex problems, they also must get others to accept the proposed solution (Coccia 2021a). In fact, the critical decisions of leaders can coincide or compete with those of other parties, that hold other positions and interests that who are likely to suggest various alternative solutions and actions (Venette 2003). Vital factors for a critical decision in aversive environment are:

(a) A threat to the organization
(b) The element of surprise
(c) A short decision time

Different types of critical decisions are described as follows (cf., Seeger et al. 1998; Shrivastava et al. 1988; Bundy et al. 2017).

### Responsive Critical Decision

When a problem hits organizations/nations, it is important to have a plan of action ready that matches the hazardous situation at hand. Crisis management team executes the plan of critical decision and handles any unexpected roadblocks that may pop up.

### Proactive Critical Decision

Proactive critical decision anticipates a potential problem and works to prevent it or to prepare for it. For example, building an earthquake-resistant factory and sharing an evacuation plan with employees/population are methods to prepare for natural disasters. While not all crises can be prevented or planned, the actively monitoring of threats to organizations/nations can reduce the impact of problematic and/or hazardous situations in society.

### Recovery Critical Decision

Sometimes, it is not possible to see the complex problem coming (e.g., earthquake, pandemic, etc.), or it is too late to prevent the damage it caused in society. In these cases, organizations/nations may not be able to lessen the impact, but it can begin to salvage/recovery what is left of the problematic situation.

## Structure of Decision-Making and Strategies for Critical Decisions

The process of critical decisions is based on strategic operations and steps, such as (Linstone 1999):

- The definition of a complex problem *Pr* from volatile environment and the implicit assumption that the problem can be solved or constrained. After that, it is important to gather information for possible solutions of the problem *Pr*.
- *Reductionism*, the study of complex problems in terms of a very limited number of variables and the interaction among them.
- Identification of the purpose of critical decision about the complex problem *Pr* under study.
- Suggestion and evaluation of different alternative solutions to complex problem *Pr* under study.
- Ignoring or avoiding the individual interests.

– Selection of the optimal solution, or the search whenever possible, for a best solution in a short time.
– Implementation of the critical decision and evaluation of results.

In short, the starting point of critical decision is a complex problem that we assume a possible solution exists. A complex problem has several solution concepts (*Sl*), each of which can lead to several consequential problems (*Pr*) and solutions (*Sl*). A critical decision can be schematically summarized by a tree structure of decision-making with consequential levels of *Pr* and *Sl* (Fig. 1).

Different strategies for critical decisions in the presence of turbulent scenario are schematically summarized in Fig. 2.

A simple example can clarify different strategies applied for critical decisions to solve complex problems (cf., Lloyd and Dicken 1977).

First of all, we create a matrix of outcome (or payoffs) associated with strategies and environmental situations as in Table 1.

Critical decision depends on manifold factors, also considering the behavior of management towards risk and uncertainty. Strategies and results of critical decisions listed in Fig. 2 are:

- *Pessimistic critical decision* is based on a rule of *max-min*, selecting the max of the worst result in each strategy:

145 for strategy 1 is the critical decision with *max-min*
130 for strategy 2
118 for strategy 3

- *Optimistic critical decision* is based on a rule of *max-max*, selecting the max of the best result in each strategy:

200 for strategy 1
220 for strategy 2
225 for strategy 3 is the critical decision with *max-max*

- *Rational critical decision* considers relative probabilities of each environmental situation.

  If the probability of different environmental situations in Table 1 is assumed to be:

**Comparative Critical Decisions in Management, Fig. 1** The problem-solution tree for critical decisions. *Note 1*: *Pr* problem; *Sl* solution. *Note 2*: the increasing number from left to right indicates the sequence of decisions to cope with consequential problems or hazardous situations

**Comparative Critical Decisions in Management, Fig. 2** Strategies for critical decisions

| | Probability |
|---|---|
| Environmental situation I | 0.2 |
| Environmental situation II | 0.5 |
| Environmental situation III | 0.3 |
| *Total* (certain event in probability) | 1.0 |

then critical decision here is based on selecting the strategy with the *highest expected value*, given by:

| *Strategies* | | *Expected value* |
|---|---|---|
| Strategy 1 | 0.2(200) + 0.5(155) + 0.3(145) | *=161* |
| Strategy 2 | 0.2(130) + 0.5(220) + 0.3(130) | *=175* is the critical decision |
| Strategy 3 | 0.2(118) + 0.5(118) + 0.3(225) | *=150.1* |

- *Approximate critical decision* assumes that the probability of different environmental situations is equal. Table 1 has three environmental situations, and the equal probability is 0.333 (i.e., 1/3 = 0.333. . .):

| | Probability |
|---|---|
| Environmental situation I | 0.333. . . |
| Environmental situation II | 0.333. . . |
| Environmental situation III | 0.333. . . |
| *Total* (certain event in probability) | 1.000 |

This critical decision is also based on selecting the strategy with *the highest expected value*:

| *Strategies* | | *Expected value* |
|---|---|---|
| Strategy 1 | 0.33(200) + 0.33 (155) + 0.33 (145) | *=165* is the critical decision |
| Strategy 2 | 0.33 (130) + 0.33 (220) + 0.33 (130) | *=158.4* |
| Strategy 3 | 0.33 (118) + 0.33 (118) + 0.33 (225) | *=152.5* |

- *Critical decision with min-max strategy.*

If the critical decision, *a priori*, is the strategy 3 and the environmental situation, *a posteriori*, is the I in Table 1, then the best critical decision *ex post* would be strategy 1, rather than strategy 3; the regret *ex post* for the wrong choice done *a priori* is 83 (i.e., 200–118). The calculation of this value for each cell in Table 1 is the basis for *min-max* rule of critical decision, given by minimizing the max value of strategies, i.e.,

| | |
|---|---|
| 80 for strategy 1 | |
| 95 for strategy 2 | |
| 82 for strategy 3 | is the critical decision with *min-max* |

## Improvisation for Critical Decisions

Planning can reduce uncertainty, but even the most carefully devised plans may have to be abandoned or modified in the face of unanticipated changes, unforeseen hazards or new

**Comparative Critical Decisions in Management, Table 1** Matrix of *payoffs* for a critical decision process

| | Environmental situation | | |
|---|---|---|---|
| | I | II | III |
| *Strategy 1* | 200 | 155 | 145 |
| *Strategy 2* | 130 | 220 | 130 |
| *Strategy 3* | 118 | 118 | 225 |

challenges or emergencies. Improvisation is one of approaches that stands outside of rational models of decision-making mentioned above. Improvisation is a combined behavioral and cognitive activity that requires consequential creativity under tight time constraint in order to meet performance objectives (Mendonça and Fiedrich 2006, p. 350). Improvisation carries an immediate answer for a need in the presence of environment threats or hazardous situations (Lee 1995). Improvisation is also a way of taking advantage of important and unexpected opportunities without formal plans or systematic procedure (Sharkansky and Zalmanovitch 2000). While rational planning aims to control a situation by reducing the uncertainty, improvisation is a reaction to a novel situation and a way of working within uncertainty. In addition, while rational planning is directed at optimal solutions, improvisation aims at dealing with problems in satisfying way rather than solving them in an optimal manner. In short, improvisation may be employed to overcome the limitations of rational planning and/or in unforeseen situations in the initial phase of emergency and/or in unforeseen situations in the initial phase of emergency. Understanding of cognition in highly non-routine situations can lead to improvements for decision-making in these situations (Klein 1993). A two-stage process for improvisation may be as follows: (1) the organization recognizes either that no plan applies to the current situation or that a plan cannot be executed, and (2) the responding organization has to develop and to deploy one or more new procedures. Mendonça and Fiedrich (2006, p. 350) argue that:

> The improvisation may range from substitution (e.g., using a close substitute resource for one that is unavailable) to the construction of new procedures (e.g., developing an entirely new procedure). In the case of substitution, the responding organization 'mixes and matches' existing procedures and/or the materiel used in them. At the other end of the spectrum, the organization must develop new procedures and possibly find new material for use in those procedures. More radically, it may also entail changing the goals of the response (e.g., deciding in the field that the real problem to be solved is providing shelter in place rather than evacuating).

The question of *when* to improvise for a critical decision may be conceptualized as a choice problem, in which the ability or likelihood of a decision-maker to categorize correctly is influenced by a number of factors, such as penalties associated with making an incorrect choice and the likelihood that the response will succeed. The question of *how* to improvise may be conceptualized as a search and assembly problem, which may be influenced by manifold factors, such as time available for planning, level of hazards and risk in the environment, negative effects in society, and the results of prior decisions. In short, it is important to learn how to develop and deploy new procedures and critical decisions in a consequential manner under time constraint; after that, inform multiple decision-makers and make inferences about the present and likely future states of complex problems and systems (Weick 1993, 1998). Indeed, training has proven capable of improving human ability to recognize salient similarities and differences between current and past situations for supporting appropriate critical decisions – even at a very fine-grained level (Klein 1993). Hence, improvisation involves the ability to act in real time when the need arises and to find an timely action when none of the established alternatives appear to be practical. It is useful when there is uncertainty, few precedents, or few reliable facts and suitable routines and when there

is a high pressure to act in a short time or with resources that appear to be insufficient. Stressful environments may foster improvisation more than less fraught ones. Thus, unpredictable and rapid changes of environments are more likely to promote improvisation than more stable environments. Improvisation may be also more likely when there is not enough time, information, knowledge, or material resources to plan, measure, weigh, and analyze an optimal response or when opposing demands are so intense that calculated compromise appears unproductive. Thus, critical decision with improvisation is likely to occur in emergencies, crises, hazardous and novel situations and when the problem to solve is perceived to be intractable. Improvisation has inherent drawbacks. It may generate instability in the environment and consequential improvisations to cope with the effects of previous improvisations. Improvisation tends to be judged by its results that can lead to success or fail.

## Conclusions

The decision rule and mechanism for critical decisions, of course, change according to the hazardous situation that can be affected by manifold organizational variables and environmental factors. In this context, it is important to consider the *ecological rationality* that claims *how* the rationality of a decision depends on circumstances in which it takes place, so as to achieve one's goals in a specific context. What is considered rational under the theory of rational choice, it might not always be considered rational under the ecological rationality account. In particular, rational choice theory puts a premium on internal logical consistency, whereas ecological rationality also targets external performance in the world (cf., Allais 1953; Kahneman et al. 1982; Gigerenzer and Todd 1999; Simon 1955). However, within process of critical decisions, it is also important to consider bounded rationality of decision-makers, i.e., rationality is limited when individuals make decisions by the tractability of the decision problem, the cognitive limitations of the mind, the manifold environmental variables, and the time available to make the decision. Organizations/nations/individuals, in a context of *bounded rationality*, aim to a behavior of *satisficing* rather than maximizing critical decisions to cope with consequential environmental threats or contingent situation in the presence of highly restricted time (Simon 1947, 1957; Gigerenzer and Selten 2002). In general, critical decisions provide vital material and information for a process of learning useful to cope with turbulent and hazarduos situations in future. In fact, critical decisions are part of collective memory within and between organizations/nations and a vital source for historical analogies useful to leaders and organizations/nations in future complex and hazardous situations (cf., Seeger et al. 1998; Shrivastava et al. 1988; Bundy et al. 2017). Overall, then, critical decisions deal with complex problems that are choice situations in which what is done makes a significant difference to those who make the choice (Ackoff and Rovin 2003, p. 9). The complex and unforeseen problems can be treated in different ways as follows (Ackoff and Rovin 2003, pp. 9–10):

- *Resolution* is when management/individual employs behavior previously used in similar situations, adapted if necessary, so to obtain an outcome that is good enough. This approach for critical decisions is based on past experience, trial and error, and a common sense.
- *Solution* means to discover or create a behavior that yields the best or approximately the best possible outcome, one that optimizes. However, change in environment and new information can cause solutions to deteriorate. In general, solutions do not exist in isolation from other problems in environment.
- *Dissolution* means to redesign either the organization that has the problems or the environment in order to eliminate the problems or sources of problems, thus enabling the organization to do better in the future than the best it can do today. Moreover, stakeholders might seize upon the lessons of crises to advocate measures, policies and organizational reforms to improve the overall efficiency of organization/nation (cf., Bundy et al. 2017).

To conclude, critical decisions of complex and hazarduos problems can be based on a mix of approaches described here in the presence of more and more turbulent markets, uncertain and volatile environments/situations.

## Introduction

The Middle East and North Africa (MENA) region has been known to have some of the longest regimes of centrally controlled governments. In the aftermath of the 2011 Arab Spring, citizens and political pundits alike expected this centralized political system to open up and create spaces for local government action. Seven years have passed, governments have changed, yet local governments remain incapacitated. Some commentators have pointed to this excessive centralization as a relic of the region's historical connections to the Ottoman (e.g., Coşgel and Miceli 2005; Tosun and Yilmaz 2008) and European rules (e.g., Hanna 1995). Others like Nefissa (2009) see the problem as part of a complex trend toward informal and apolitical decentralization.

To gain a deeper understanding of why local governments in MENA countries are still weak in the post "Arab Spring" era, it is expedient to unpack decentralization policy initiatives in the region taking into consideration the sequencing of such initiatives, the actors involved, and the competing interests at play. Drawing on recent discussions of sequential decentralization (e.g., Falleti 2005; Awortwi 2011), this paper argues from a comparative case of Egypt and Tunisia that the current incapacitation of local administrations in the MENA region is the result of

deliberate ill-conceived decentralization policy sequences pursued by central governments. In addition to examining the nature and extent of decentralization at different conjectures and tracing the effects of earlier reforms on later ones, this paper helps explain how institutions, personal interests, and political environmental factors influence the intergovernmental balance of power.

The choice of Egypt and Tunisia was informed by two factors. First, they both have a history of strong central government control. Second, from the late 1950s up to the post 2011 revolution era, both Egypt and Tunisia underwent some forms of decentralization. In the case of Egypt, the process was political, administrative, and fiscal decentralization. Tunisia on the other hand pursued administrative, political, and fiscal decentralization reforms. In both countries, decentralization was pursued under the guise of strengthening subnational units.

## Decentralization as Policy Sequencing

Decentralization is a multidimensional process (Montero and Samuels 2004) that involves the transfer of "planning, decision-making, or administrative authority to the state's field organizations, local administrative units, semi-autonomous and parastatal organizations, local governments or NGOs" (Rondinelli et al. 1984, p. 9). The essence of decentralization, as the literature suggests, is to empower subnational institutions administratively, politically, and/or fiscally (e.g., Ezcurra and Rodríguez-Pose 2011; Vo 2010; Bardhan 2004; Oates 1993).

*Administrative decentralization* ensures the deconcentration of planning and management responsibilities from the central government and its agencies to subregional units, while *political/democratic decentralization* transfers political and democratic authority to lower-level governments by granting them the power and autonomy to determine their own form of government, representation, policies, and services. *Fiscal decentralization* transfers responsibility for financial planning, revenue generation, and public spending from the central government to subnational governments and grants them the authority to collect taxes and spend revenues.

In a comparative study of decentralization policies in Argentina and Columbia, Falleti (2005) unpacked the three forms of decentralization from a path dependency perspective in order to understand the balance of power between central and local governments. Falleti (2005) demonstrated that governments pursue decentralization policies in six different sequential paths. Two of these paths – the central government's path and the local government's path – are relevant to this paper and are discussed in the next section.

### The Central Government's Decentralization Path

According to Falleti (2005), given the three modes of decentralization, the central government will always prefer to decentralize administratively. This is because administrative decentralization allows the central government to transfer authority without necessarily shifting the balance of power. If bureaucratic functions are transferred to subnational governments without adequate resources, the latter will become more dependent on the central government for funding and less resistant to central government control. If the process of decentralization continues, the central government will have the full control over the timing, pace, and contents of the next stages of the reform process. Ultimately, the path that will be generated is *administrative decentralization (A) → fiscal decentralization (F) → political decentralization (P)*.

### The Subnational Government's Decentralization Path

Where the interests of local governments actors dominate at the inception of decentralization reforms, political decentralization is likely to be first to occur. With political autonomy comes financial responsibility. Thus, the second round of decentralization would result in local governments bargaining for financial autonomy and access to state agencies at the local level. In the end, the path that will be generated – $P \rightarrow F \rightarrow A$ – will likely produce more significant change to the intergovernmental balance of power because in

addition to autonomy, local governments will have funds to support administrative decentralization.

### Other Paths to Decentralization

Depending on the exogenous factors at play (fiscal crises, strong local political activism, etc.), alternative sequences – A → P → F, P → A → F, F → A → P, or F → P → A – may develop. The A → P → F scenario takes place when central government interests are more dominant at the inception of the sequence but subsequently faces strong push back from local political action. The P → A → F scenario on the other hand takes place when local government interests are more dominant at the inception of the sequence, but due to fiscal pressures or other national crisis, the central government intervenes in the second stage of the decentralization process.

If neither the central government nor subnational interests prevail during the onset of the decentralization process, either the status quo will prevail or the central government and local actors will settle for the second most preferred option, which is fiscal decentralization. If parties settle to begin with fiscal decentralization, the subsequent sequence will still depend on the relative power balance between the central government and subnational politicians. If the central government interest prevails at the second stage of reforms, administrative decentralization should follow, with political decentralization happening last (F → A → P). On the one hand, if subnational interests prevail, political decentralization should be next, with administrative decentralization taking place last (F → P → A).

## Tracing the Sequential Path of Decentralization in Egypt

The process of decentralization in Egypt started with some level of political autonomy. Following the unilateral declaration of Egyptian independence by the British in 1922, and the subsequent drafting of the 1923 Constitution, municipalities, towns, and villages were mandated to elect their council members. Nonetheless, this move was not necessary conceived as a means of promoting local engagement, but to consolidate the central government's place in local affairs. This view is evidenced by the fact that a caveat in Article 133 mandated the inclusion of nonelected council members in so-called "exceptional" cases. Besides, the Wafdist leadership sought to use local elections as a means to appease village leaders who had supported the resistance against British occupation. The first round of decentralization policies in Egypt therefore fell short of providing any meaningful autonomy to local governments as subnational councils lacked the power to plan and manage their own affairs. Although political decentralization was initiated at the very onset direct rule in Egypt, the central government's interests prevailed and undermined any meaningful local engagement in the first round of decentralization reform.

The second round of local administration reforms was mainly administrative. Following the 1952 revolution, the Nasser government sought to deconcentrate administrative functions to subregional levels. He at the very least, recognized the role of subnational administrative units by labelling them *local government bodies* in Chapter 4 of the 1953 Constitution. The mandates of elected local councils were also increased to include the ability to establish and manage economically and socially. Beside these administrative reforms, the government initiated some form of fiscal decentralization by granting local councils the responsibilities to raise taxes and fees within their respective boundaries. Each council was also accorded the responsibility to propose and publish a comprehensive annual budget for its income and expenses based on central government guidelines. However, the central government could either exclude or include budget items at its discretion. With the creation of the 1971 Constitution under Sadat, the term "local government" was replaced with "local administration," signaling the central government's intention to entrench its position in local affairs. The Sadat period also saw the spatial divisions of Egypt into the governorates, cities, and villages we find today.

The most significant change during the third round of local administration reforms was the enactment of Local Administration Law 314 of 1982 which helped to streamline subnational responsibilities. However, the Mubarak government's action to change the title of Law 43 from "On Local Government" to "On Local Administration" undermined this effort. Beside the title change, the amendment also took away the powers of elected local councilors to hold appointed executives accountable. Following the 2011 revolution and ousting of Mubarak, many expected a more supportive approach toward local administration. However, after a 2014 Constitutional change and a series of promises to hold local elections, local governments remain as incapacitated as ever. Evidently, Egypt's sequence of political, administrative, and fiscal reforms resulted in very minimal change in the relative power of governors, local councilors, and mayors. Governors and mayors are still appointed, and majority share of local government budgets are still funded by the central government. In effect, the decentralization policies pursued and the sequence in which the reforms took benefitted the central government rather than improve the internmental balance of power in Egypt.

## The Sequential Path to Decentralization in Tunisia

The first formal decentralization reform in post-independence Tunisia was administrative decentralization. Upon assuming office in June of 1956, the government of Habib Bourguiba abolished the native *quaidats* and reterritorialized the Tunisia into 14 governorates. With the backing of Tunisia's 1959 Constitution, different layers of subnational government (including municipalities, delegations, and sectors) were officially created. The sector (*secteur*), in particular, was created as a replacement for the *shaykhat*, a former village-level administrative unit that had existed along tribal lines. By replacing the *shaykhat* (headed by community elders) with *secteurs* (headed by Neo Destour Party faithfuls), the central government managed to change the state-local power dynamics from a citizen orientation to central government control.

While governorates had the mandate to prepare budgets and impose certain taxes, they still relied heavily on the central government for financial support. Other lower-level administrative units including delegations, municipalities (apart from Tunis), and sectors did not have real revenues or fiscal capacities which resulted in overreliance on the central government. By imposing administrative decentralization on subnational governments, the central government managed to consolidate its interests in the first round of decentralization.

A certain level of political decentralization came next in the first round of decentralization reforms. In the spring of 1957, local elections were organized for 94 town councils, 30 of which were newly created (Moore 1965). Subsequent elections for town councils took place in 1960 and 1963. Political decentralization did not however come with autonomy as heads of the governorates, delegations, municipalities, and sectors were still appointed by the ruling political party. While Bourguiba is often credited with strengthening secular ideals in Tunisia, he is equally criticized for stifling political pluralism. In his era, many opposing party leaders were arrested, and their parties disbanded. Political autonomy at the local level was almost nonexistent because local administrative units were seen as enclaves of anti-secularism. In a way, the Bourguiba government only sought political decentralization as a means of changing public perception on his government.

Fiscal decentralization was the last in the first round of decentralization reforms. Between 1975 and 1978, a series of reforms were executed by the central government in order to improve the financial capacities of *communes* (now municipalities). Reforms included changes to their local taxation powers, size of grants, and loans. As a result, there were some modest increases in revenues and a more significant increase in central government grants especially to smaller and more rural *communes* that were very dependent on the central government. In theory, these reforms should have given more political latitude to elected communal councils. Nonetheless, local governments

remained severely constrained by central government authorities. In the end, the results of the reforms were partial and halting as the balance of power continued to benefit the central government. Failures of these reforms lingered until the second round of fiscal decentralization in the mid-1990s.

Under Ben Ali in 1987, Tunisia continued to remain a highly centralized state with weak subnational administrations. Decision-making remained highly centralized, and municipalities played a relatively minor role in local development. Their share of total public spending only amounted to 4%. Municipalities also had limited functional responsibilities. Local authorities did not have any autonomous fiscal control, as they were sidelined in taxation processes. Half of the financial assistance from the central government was transferred from the common fund for local authorities in the form of an operations allowance. The other half came from the loan and support fund for local authorities.

Following the Jasmine Revolution and the subsequent overthrow of President Ben Ali in 2011, Tunisia has taken new positive steps toward administrative, political, and fiscal decentralization. These renewed steps were mooted in part by the signing of a new Constitution in 2014 that fully recognizes the role of local governance. Another important step was the creation of a standalone Ministry of Local Affairs in mid-2016. Chapter 7 of the 2014 Constitution recognized decentralization as the essential starting point for more efficient and accessible administration to the citizens. The government has also signaled its intent to place municipalities at the heart of urban development by making them more active players in the planning, implementation, and delivery of municipal infrastructure and services. This meant that local governments are being prepared toward having their own legal personality and autonomy in addition to administrative and financial competence (Mediterranean Commission 2015). The second round of political decentralization also involved a widespread recognition that elected municipal councils and mayors must be more than passive spectators in urban development. As of the writing of this paper, Tunisia had held its first post revolution municipal elections.

## Conclusion

By unpacking and exploring the administrative, political, and fiscal components of decentralization in Egypt and Tunisia, this paper has provided empirical support to previous findings (Falleti 2005; Awortwi 2011) that the sequence in which decentralization reforms take place and the degree of change in intergovernmental balance of power are largely dependent on influence of the central government. It shows that in the MENA region, the sequence of decentralization is always initiated by the central government, subjecting the entire process to manipulations. In the case of Egypt, the study shows that political decentralization was pursued as the first in the series of decentralization reforms undertaken after independence in 1922. Political decentralization began not necessarily out of government interest, but as a means to reward local leaders who had supported the nation's struggle for independence.

In the case of Tunisia, administrative decentralization which is the central government's preferred form of decentralization occurred first, setting up strong central government control and creating very little local autonomy. Just like the case of Egypt, political decentralization in Tunisia did not occur because local interests prevailed in the second stage. It did because the central government used political decentralization as a platform to establish several networks of party branches in order to consolidate its foothold at the local level. The initial path that was created subordinated local governments and created a path for elites like Ben Ali (who succeeded Bourguiba) – a path they did not have any intention to break.

Comparative digital government; Comparative e-government

## Definition

The digitalization of the public sector concerns the ICTs usage in public organization for improving government activities, supporting online interaction with citizens and businesses.

## Introduction

Since the beginning of the 2000s, public sector (PS) has been characterized by modernization process for improving government activities. In this process, the Information and Communication Technology (ICT) has played a key role, enabling new possibilities for providing citizens and businesses better, more efficient and effective

services. Indeed, ICTs promote interactions between government and citizens, and encourage decentralization, transparency, and accountability. The digitalization of the PS was characterized by implementation of several technologies at different levels of government all around the world, contributing to the diffusion of digital government or e-government. The OECD (2003) defines e-government as the use of ICTs, and particularly Internet, as a tool to achieve better government. Fountain (2001, p. 4) prefers to use the term "digital government" as a government that is "organized increasingly in terms of virtual agencies, cross-agency and public–private networks whose structure and capacity depend on the Internet and web".

Benefits resulting from digitization of the PS concern improvements in communication with citizens and businesses, a better access to government information and services, as well as a greater public participation in government activities. The rising adoption of ICT tools by government has attracted the interest of several scholars and practitioners, who have begun to investigate this issue. In particular, Helbig et al. (2009) identified different approaches to digital government research: comparative studies, benchmark reports, regional studies, fundamental issues, best practices studies, and transnational studies. In particular, the comparative perspective for research on the digitalization in the PS is mainly aimed to identify similarities and differences across nations as well as transferable best practices, about ICT usage. The focus is on the role played by contextual factors (such as culture, history, political structures, and social norms) on the level of digital government (Fountain 2003; Pardo and Styrin 2010).

This study is aimed to investigate the digitalization process in a comparative prospective considering Spanish and Italian municipalities. Municipalities in Italy and Spain were interesting fields for the investigation of these phenomena. Both countries have legislative reforms that regulate mandatory information disclosure through municipalities' websites. However, in many cases, this information disclosure through websites is still very fragmented, failing to take advantage of the full potential of ICTs to improve government activities.

## State of Art

Many countries have implemented specific projects to encourage the use of the web as a tool of electronic service delivery and electronic democracy. These initiatives are an attempt to improve the political and social environment and to change the ways in which PS functions are performed. For example, the diffusion of digital government allows to simplify and speed the access to information about the political process and services and to support citizen participation, involving them in government decision-making.

Important requirements of digital government are both implementing a civic culture oriented towards new technologies and, at the same time, the availability of technical infrastructure that enables the effective diffusion of these tools.

Indeed, the differences, between or within countries, in diffusion and use of ICTs and electronic networks (digital divide) can potentially limit the success of digital government.

In addition, it is important to keep in mind that the availability of technical infrastructure and the introduction of ICTs in the PS will not automatically create a better or more open government unless it is accompanied by policies and strategies aimed to promote and support the effective utilization of these tools.

In this light, digitalization research in PS is characterized by many studies on "maturity models" or "e-government development models" that show the implementation status of the e-government process. A maturity model is a method for assessing the progress and success of the e-government implementation process in the PS through the definition of development stages. Thus, it is possible to identify best practices for comparing and benchmarking. In particular, Layne and Lee (2001) proposed a first model based on four stages. The first stage is "cataloguing," it is related to the one-way communication between government and citizens through websites that, thus, provide public information.

The second stage is defined as "transaction" because allows online transactions with governments and the communication is bilateral. The third stage is the "integration" of government operations within of the same functional areas of the several government agencies. The final stage is the "horizontal integration" that allows to the different functional areas to be integrated within the same digital system and to share a central portal. Overall, these development models of digital government are agreed in easier and faster access to public information as initial stage until to later stages characterized by greater integration and more functionality for citizens.

The disclosure of information via website is considered at the basis of the transparency process, which is the "ability to determine what is going on inside government" (Piotrowski and Van Ryzin 2007, p. 306). Therefore, ICTs improve transparency, favoring citizens' trust in the public institution, the organization's image, and the public expense monitoring. Many legislative reforms have regulated mandatory disclosure via municipalities' websites, the so-called e-disclosure. For example, in Italy, the legislative decrees 150/2009 and 33/2013 regulate mandatory information disclosure by municipalities. In particular, the legislative decree 150/2009 emphasizes the extension of control of municipalities' activities to citizens to improve their performance. The legislative decree 33/2013 regulates mandatory disclosure via municipalities' website, listing the specific information that municipalities must disclose on their website. In the case of Spain, law 57/2003 underlines that ICTs are a tool to contribute to transparency in the public sector. Law 11/2007 regulates citizens' electronic access to public services to increase citizen participation and involvement. In particular, law 19/2013 states that information on local governments must be published on their websites in a clear, structured, and reusable way.

## Defining E-disclosure Attitude

The transparency process and e-disclosure have become an interesting area of inquiry, but research on these issues, mainly at the level of local governments, is still in its initial stages (e.g., Tejedo-Romero and de Araujo 2015; Bonsón et al. 2012). Local government is an important subject for the study of e-disclosure for the traditions of participation at the local level because public information provision and service deliver exerts influence more directly in citizens' everyday lives. Moreover, the ICTs usage at the local level has increased considerably, though municipalities' websites in Western Europe are mostly informative and, thus, a one-way communication tool rather than a way to establish a symmetrical interaction with citizens providing a transactional service (e.g., Tat-Kei Ho 2002; Drüke 2005; Coursey and Norris 2008).

In particular, e-disclosure attitude is the propensity to disclose information via web by a public actor. In literature, e-disclosure attitude is traditionally measured through synthetic indicators considering information provisioned on the official municipalities' websites, known as e-disclosure Index.

Many research underlined the role of political and economic factors as key drivers of the digitalization of PS, and of the e-disclosure attitude in particular (e.g., Laswad et al. 2005; Jorge et al. 2011; Bonsón et al. 2014; Tejedo-Romero and de Araujo 2015). For example, the political setting in terms of political position of the ruling party or the gender of the mayor can influence some aspects of administration culture and, consequently, the propensity for e-disclosure. More visibility on the web or popularity of the website can encourage municipalities to disclose more information for meeting Internet users' pressure. Moreover, municipalities with greater level of public debt (leverage) as well as better financial autonomy tend to give citizens more information (for example via websites) for helping creditors monitor their activities or on the destination of revenues (essentially taxes and fees). Finally, the citizens' wealth is considered an e-disclosure determinant because people with higher income expect to receive more services and greater information by government.

In line with previous literature, it is possible to identify two categories of determinants of

e-disclosure attitude: political-social determinants, such as gender of mayor, political position, and Internet visibility and economic status determinants, such as financial autonomy, citizens' wealth, and leverage.

## A Comparative Study of E-disclosure Attitude in Italy and Spain

The digitalization process in a comparative prospective has been empirically investigated considering the e-disclosure attitude of Italian and Spanish municipalities trough the analysis of 287 municipality websites (142 in Italy and 145 in Spain).

For Italy, data on the e-disclosure determinants were collected, in 2013, using data from the Italian National Institute of Statistics (ISTAT) as well as from the website "comuniverso," a free web portal that publicized political, economic, and geographic information on Italian municipalities. For Spain, data on the determinants were collected, in the same year, from Badespe, a free database for the Spanish PS.

The concept of "disclosure index" was proposed by Buzby (1975) and formalized by Cooke (1989) using an item-based approach with a dichotomous procedure in which an item is scored one if it is disclosed and zero if otherwise. The choice of items is based on relevant topics for citizens in Spain and in Italy, and it derives from previous literature (e.g., Jorge et al. 2011).The e-disclosure Index (eDI) is computed considering the following 13 items (described in Table 1): organization (i1), governing body (i2), consults (i3), wages body (i4), organogram (i5), controlled company (i6), internal auditing (i7), performance (i8), balance (i9), balance controlled company (i10), economic planning (i11), support planning (i12), and assets (i13).

For each s-th item, it is constructed a dichotomous variable ($i_s$) which assigned a value of 1 if the municipal website disclosed the information

**Comparative Digitalization, Table 1** Items descriptions for e-disclosure Index

| Number | Items | Description |
|---|---|---|
| 1 | Organization | Organization description including information concerning the following: political bodies, staffers, and their responsibilities; expertise and resources for each office; name of public official for each office; institutional telephone numbers; and email accounts and certified mail boxes |
| 2 | Governing body | Information about the staff, such as permanent workers and their cost |
| 3 | Consultants | Information about the staff, such as temporary workers and their cost |
| 4 | Wage bodies | Information about the wages of staff |
| 5 | Organizational structure | Organizational structure of the departments and offices |
| 6 | Controlled companies | Information about supervised public institutions, private-sector entities in public control, and private company investments, such as the following: list of corporate bodies, list of companies with which they have relationships, diagrams that show the controlled companies' activities, and the relationships with the controlling organization |
| 7 | Internal auditing | Information regarding the activity of internal control structures |
| 8 | Performance | Information about organizational and individual performance evaluation, the results obtained in relation to management objectives, political program and services provided to the citizens |
| 9 | Balance | Publication of financial statements from the municipalities |
| 10 | Balance controlled company | Publication of financial statements from the controlled company |
| 11 | Economic planning | Information about the plan of indicators and expected results the financial statement |
| 12 | Support planning | Information about the plan of indicators and expected results of the organizational planning |
| 13 | Assets | Information about municipalities' assets, such as values, location, and revenue |

in question and assigned a value of 0 if otherwise. The eDI Index was computed by the following equation:

$$eDI = \sum_{s=1}^{n} i_s/n$$

where n = 13 (maximum number of disclosure items).

The Index is a ratio comparing the level of disclosure by municipality (the sum of disclosed items) and the maximum level of possible disclosure. It ranged from 0 to 1, with 1 indicating the maximum level of disclosure and 0 denoting a municipality with no disclosure at all. In particular, the construction of the index is based on unweighted items to reduce subjectivity in assigning different weights to each item.

For analyzing the e-disclosure determinants, a Tobit regression model was used. The Tobit model, also called a censored regression model, was designed to estimate linear relationships between variables when there was either left or right-censoring (or both) in the dependent variable, as in the case of the e-disclosure Index that ranged between 0 and 1.

Moreover, cluster analysis was performed to deepen the e-disclosure determinants in Italian and Spanish municipalities. The Kruskal–Wallis (K-W) test was carried out to check for the significance of the differences among clusters in terms of both level of e-disclosure attitude and determinants (The Kruskal–Wallis test is a popular non-parametric procedure. It assesses for significant differences in a continuous dependent variable by a categorical independent variable.).

## Findings

The findings of the regression model showed that Internet visibility, citizens' wealth, and leverage are the main determinants of the e-disclosure attitude for municipalities. These results are in line with previous literature on this topic.

By the cluster analysis, Italian and Spanish municipalities were classified into four clusters. The four clusters corresponded to different levels of e-disclosure: poor (cluster 1), fair (cluster 2), good (cluster 3), and excellent disclosure (cluster 4). The results of the K-W test showed a very significant difference among clusters for the e-disclosure Index (Fig. 1).

**Comparative Digitalization, Fig. 1** Cluster composition by country

**Comparative Digitalization, Fig. 2** Municipalities by level of wealth and leverage (standardized values)

**Comparative Digitalization, Fig. 3** Factors that characterize municipalities with high e-disclosure attitude

In particular, there was a greater level of e-disclosure in Italy, with over 70% of Italian municipalities being equally divided between the best clusters (3 and 4). Furthermore, almost half of the Spanish municipalities (46.21%) were classified in the cluster with poor level of e-disclosure (cluster 1).

The cluster analysis revealed that higher levels of wealth and leverage characterized municipalities with excellent e-disclosure attitude, while the differences among clusters in terms of Internet visibility were less marked (Fig. 2). Differently, financial autonomy was not significant for the differences between clusters.

Moreover, some factors characterized municipalities with high e-disclosure. In particular, these factors were the male gender of the mayor (72% in cluster 3 and 58% in cluster 4) and the political ideology of municipal ruling parties, that is, "right" in 72% of the municipalities within cluster 4 (Fig. 3).

## Conclusion

This research contributes to an overall conceptual understanding of the digitalization process by municipalities via website, deepening the e-disclosure attitude and determinants. Compared to prior studies on this theme, the study offers some important contributions to the existing literature. Findings show the role of ICTs for supporting transparency, demonstrating the municipalities' characteristics that promoted higher e-disclosure attitudes. Moreover, although a growing number of studies on digitalization of the PS are appearing, there is not enough evidence of investigating from a comparative perspective. In this regard, the cluster analysis between the two countries (Italy and Spain) highlighted that several factors lead to some differences with regard to higher level of e-disclosure attitude. Consequently, the contexts in which transparency is applied could affect municipalities' e-disclosure attitude. Thus, these findings tend to support a novel lens through which to investigate ICT-enabled transparency issue that emphasizes the role of contingency factors. In this sense, the comparative investigation could further the understanding of how the use of ICTs for digital governments differs by social context, administrative culture, or form of government. In fact, there has, until recently, been very little empirical evidence focused on contingency factors surrounding digital government diffusion (e.g., Zhao et al. 2014).

These findings can offer policymakers several recommendations for developing policies to improve the level of transparency and to support digitalization process in local governments. Public managers should encourage municipalities with citizens with a lower per capita income to use the website for improving transparency. In this sense, policy makers should implement strategies aimed at reducing the digital divide between citizens with different per capita income. Moreover, municipalities should focus more attention on Internet visibility because it would seem that municipalities characterized by greater e-disclosure attitude are those that invest more in web communication, employing qualified personnel and identifying new organizational roles in the municipality, such as web communication manager.

# Comparative Efficiency Studies

Simona Alfiero and Alfredo Esposito
Department of Management, University of Turin, Turin, Italy

## Synonyms

Efficiency analysis; Efficiency performance

## Definition

The organization's efficiency is about the comparison between the outputs (services or products) it produces and the inputs (resources) it uses. An efficient organization would be one that produces the maximum possible outputs given its inputs, or one that produces a certain level of output with the minimum amount of inputs.

Generally, the efficiency can be achieved under the conditions of maximizing the results of an action in relation to the resources used, and it is calculated by comparing the effects obtained in their efforts. Measuring the efficiency requires: (a) estimating the costs, the resources consumed the effort, in general, found in the literature as the input; (b) estimating the results, or the outputs (services, projects, products); (c) comparing the two.

## Introduction

The efficiency issue is critical to evaluate the performance of an organization.

Measuring and managing performance is relevant to anyone – individuals, firms, and organizations. No matter how good you think you are, you can always be better. However, it requires you to measure performance properly and understand what drives performance. In this way, it is possible to learn better practices, to make better decisions, and motivate improved performance.

In order to contribute to the knowledge of performance, in recent decades, many researchers have focused on studying and analyzing efficiency.

Firms and organizations use multiple inputs (resources) to pursue multiple outputs (services or products). From the relationship between input and output, it is possible to evaluate the reached level of efficiency.

Moreover, the input and output interact in complicated ways. Two resources, say labor and capital, may, for instance, both substitute and complement each other.

Such interactions imply that simple, key performance indicators, including simple financial ratios, do not suffice to measure performance or guide decision-making.

The measurement of efficiency is even more relevant in the public sector. The effective use of public resources is important to guarantee the economic growth, the stability and the individual well-being.

The adequate measurement of public sector efficiency is a difficult empirical concept and the literature on it, particularly when it comes to aggregate and international data, is rather scarce. The measurement of the costs of public activities, the determination of goals and the evaluation of efficiency via appropriate cost and outcome measures of public policies are very thorny issues. Academics and international organizations have made some progress in this regard by paying more attention to the costs of public activities, by looking at the composition of public expenditure and by monitoring the level of reached results and the satisfaction of users.

Economists are affected about the efficient use of scarce resources. The issue of efficiency finds a prominent place in the study of the spending and taxing activities of governments and public entities. Economists believe that these activities should generate the maximum potential benefits for the population and they penalize those organizations when, in their view, they use resources inefficiently.

The measurement of efficiency generally requires: (a) an estimation of costs or resources; (b) an estimation of output or services or projects; and (c) the relationship between the two. Applying this concept to the spending activities of public entities, it is possible to declare that public expenditure is efficient when, given the amount spent, it produces the largest possible benefit (output) for the population.

Often efficiency is identified in a comparative sense: the relation between input and output of an organization *alpha* is compared with the others. This can be done for total public expenditure, or for expenditure related to specific functions such as health, education, poverty alleviation, building of infrastructures, waste or water provision, and so on. If in the organization *alpha* the output exceed the input by a larger margin than in other entities, then public expenditure in organization *alpha* is considered more efficient.

The simple comparison outlined above requires that both input and output be measured in acceptable ways. This is easy, or easier, for private sector or for a single asset (machines, cars, furnaces) but difficult for public entities. It is often difficult to measure the services or output from a public expenditure. But, one could assume that, at least the costs (i.e., the resources used) should be easy to determine. Unfortunately, this is not always so. Deficient budgetary classifications, lack of reliable data, difficulties in allocating fixed costs to a specific function, and failure to impute some value to the use of public assets used in the activity can also hamper the determination of real costs (Table 1) Mihaiu et al. (2010).

In order to evaluate the performance, in terms of efficiency, several methods and approach are developed.

## Measuring Efficiency: Methodologies

There are two main methodologies used to measure the efficiency: namely parametric and nonparametric approach. Nonparametric methods differ from parametric methods by not requiring any specification of production or cost function in advance, which is a great advantage (Zhu 2009). The parametric approach requires the specification of functional form of the production, cost and profit frontier and some distributional assumptions about the error term. On the other hand, nonparametric approach does not assume any specific functional form for evaluating efficiency, and therefore, does not take into account the error term (Cummins and Xie 2008).

Another relevant distinction is between the deterministic and stochastic models.

In stochastic models, we allow for the fact that the individual observations may be somewhat affected by random noise and we attempt to identify the underlying mean structure stripped from the impact of the random elements. In deterministic models, the possible noise is suppressed, and any variation in the data is considered to contain significant information about the efficiency of the firms and the shape of the technology.

The most widely used methodology in comparative efficiency studies is Data Envelopment Analysis.

**Comparative Efficiency Studies, Table 1** Determining the efficiency indicators

| **Efficiency** | Public sector | Private sector |
|---|---|---|
| **Input (resources)** | Difficult to identify, especially when it is a hybrid (private/public) financing form | Easy to indicate |
| **Output (services, projects, products)** | Hard to quantify and to compare | Easy to determine and to make explicit quantity of money |

## Data Envelopment Analysis

Data Envelopment Analysis (DEA) is a nonparametric linear frontier method that is widely used in efficiency measurements, especially in studies of utility industries (i.e., waste and water provision), education and health. In a DEA model, the measure of efficiency of any organization is obtained using the ratio of weighted outputs to weighted inputs subject to the condition that similar ratios for every company are equal to or less than unity (Zhu 2009).

Data Envelopment Analysis (DEA) was first introduced by Charnes et al. (1978) and extended by Banker et al. (1984). The purpose of this approach was to measure the relative efficiency of each organizations or DMU (Decision Making Unit) with the best practices entity.

DEA decomposes the cost efficiency (CE) into two components. One is technical efficiency (TE) (either maximizing output for a given level of inputs or minimizing inputs for a given level of output). The other is allocative efficiency (AE) (using input in optimal proportions given the input prices and output quantities). Technical Efficiency (TE) can be further decomposed into Pure Technical Efficiency (PTE) and Scale Efficiency (SE). SE occurs when firm operates at Constant Returns to Scale (CRS) and PTE occurs when firm maximizes its output with Variable Returns to Scale (VRS). The resultant efficiency measure, ranging between zero (least efficient) and one (most efficient), depicts the distance from each unit to frontier.

Throughout the quantitative analysis, the efficiency scores computed under both the variable returns to scale (VRS) and the constant return to scale (CRS) assumptions will be used. Efficiency under CRS is deemed to be overall efficiency, as it can be deconstructed into two components, VRS and scale efficiency (SE), providing an insight into the source of inefficiencies. VRS, also known as "pure efficiency," has its boundary within CRS and reflects the managerial ability to organize inputs in the production process (Thanassoulis 2000). The ratio of these two efficiency measures (CRS/VRS) shows the impact of scale on efficiency for each company. The SE describes that part of inefficiency which can be attributed to a company because it diverged from its most productive operating scale size (Banker et al. 1984).

## Conclusion

Despite the complexities in measuring efficiency in the public sector and the problem of isolating the effects on efficiency from other external influences, empirical evidence suggests that the following three institutional factors may improve public sector performance:

- Decentralization of political power and spending responsibility.
- Arrangements that increase flexibility, agencification.
- Methods for strengthening competitive pressures through privatization and other means.
- Appropriate human resource management practice.
- In the education and health sectors, there is evidence that increasing the scale of operations may improve efficiency. This effect is attributed to economies of scale that result from savings in overhead costs and fixed costs in tangible assets. However, the impact on other public sector values such as equity, access to services, and the quality of services needs to be taken into account.

Moreover, several are the benefits from the use of performance information and the monitoring of level of efficiency:

- It generates a sharper focus on results within the management of entities.
- It provides more and better information on organization goals and priorities, and on how different programs contribute to achieve these goals.

- It encourages a greater emphasis on planning and acts as a signaling device that provides key actors with details on what is working and what is not.
- It improves transparency by providing more and better information to users and to the public and has the potential to improve public management and efficiency.

Functional and political decentralization (i.e., spending responsibility) to subnational governments also seems beneficial for efficiency. In principle, devolution of functional responsibilities, if accompanied by appropriate fiscal and political decentralization, provides incentives for subcentral governments to deliver locally preferred services more efficiently, as the burden and the benefits of public service delivery both accrue in the communities. Evidence from federal countries shows that decentralized taxation reduces the size of government; however, evidence on the comparison of countries is inconclusive in this regard.

Also the human resource management practices also matter a great deal. The soft aspects of human resource management, such as employee satisfaction and morale, are considered to be the most important drivers of performance. While wages are still important for staff, nonmonetary incentives are also essential. High wage levels – compared to similar work in the private sector – could lead to inefficiencies, although governments often are model employers and their wage policies reflect equity concerns as well. Wages are also important for attracting and retaining qualified staff, especially in case of skill shortages. Performance-related pay initiatives appear to have a low impact on staff motivation.

Findings are more inconclusive on the impact of ownership, competition, and agencification. While private ownership is not a guarantee of higher efficiency, public ownership does not necessarily lead to higher inefficiencies either. Rather than ownership *per se*, it is the importance of competitive pressure on efficiency that matters. However, there is a need to further explore for what and with whom public organizations compete. The nature of service delivery, e.g., whether it has features such as low asset specificity (high levels of alternative uses for resources) and low information costs, is crucial for successful competition in public services.

Regarding agencification, there is some evidence that a reduction of input controls combined with steering for results, financial incentives and competition could lead to increased efficiency. However, the impact on the quality of service delivery and policy effectiveness is unclear. The literature also calls attention to the major risks of agencification, including the exposure of government to financial and employment risks and opportunities for political patronage and corruption. The effects of new intragovernmental coordination mechanisms are also not known.

# Comparative Evaluation Systems

Mario Coccia[1,2] and Igor Benati[1]
[1]CNR–National Research Council of Italy, Torino, Italy
[2]Arizona State University, Tempe, AZ, USA

## Synonyms

Analytical comparison; Comparative evaluation; Comparative methods of evaluation; Rating systems

## Definition

*Comparative evaluation system* is a systematic process for data collection, measurement, and analysis of the characteristics of different entities to generate a final rating and support decision-making processes of stakeholders for specific goals.

## Introduction

*Evaluation* of a single object and/or subject in general does not provide complete information for decision-making. In order to support a rational decision, *comparative evaluation* could be necessary. Vartiainen (2002) argues that comparative evaluation refers to a cognitive process in which the evaluation and the findings of the evaluation process are set within a comparative framework. This approach establishes an assessment on the evaluand (the subject of an evaluation), comparing it with objects of the same category (cf., Cooksy 1999). To put it differently, the attribution of value is in relative terms, through comparison with similar subjects and/or objects.

Therefore, a *comparative evaluation system* (CES) is a stable set of techniques and tools to compare different units (individuals, organizations, countries, etc.) over time and space. In particular, a CES is a systematic process for data collection, measurement, and analysis of the characteristics of different entities to generate a final rating and support the decision-making processes of stakeholders for specific goals. The theoretical approach of CES has practical applications in different fields. Figure 1 shows the basic elements and steps of a CES.

A well-known CES is the rating system for the analysis of units, ranking and subsequent comparative assessment of their quality and performance-rating- (cf., Vartiainen 2002; Coccia and Benati 2018a, b). In particular, a rating system can be applied to assess the performance of individuals, organizations, and/or countries in achieving different objectives (e.g., career advancement for employees, funding for universities, international loans for countries, etc.). In the public administration, rating systems or CESs can be useful to provide information to assess performance, transparency level, and other characteristics of public organizations and/or their employees. Rating systems can pursue different objectives depending on the entity under study. As far as individuals are concerned, rating systems can be applied to personnel appraisal or recruiting. For organizations, rating systems can be aimed, for instance, at verifying the quality of the provision of services to citizens, the efficiency of public organizations, etc. Finally, for countries, rating systems can be directed to assess socioeconomic factors, such as democratization, general creditworthiness, etc. Figure 2 shows some examples of the objectives of rating systems for different entities (individuals, organizations, and countries). Although Comparative Evaluation Systems (CES) are the general category and rating systems are a main element of this set, in this contribution for the sake of simplicity, CES and rating system are used as interchangeable concepts.

Different typologies of rating systems for individuals, organizations, and countries are described in next paragraphs. For the sake of clarity, some practical examples are provided that, of course, are not a comprehensive overview of all CES applications in the public administration.

**Comparative Evaluation Systems, Fig. 1** Elements and steps of a comparative evaluation system (CES)

| | *Entities of rating systems* | | |
|---|---|---|---|
| | Individuals | Organizations | Countries |
| *Objectives of rating systems* | For hiring or recruiting personnel<br>For personnel appraisal | For identifying the best organization in the provision of a service<br>For ranking the most efficient organization | For identifying the best countries in the implementation of policies, reforms, good governance, etc. |

**Comparative Evaluation Systems, Fig. 2** Entities and objectives of comparative evaluation systems (CESs)

## Rating Systems for Individuals

Rating systems of individuals can be adopted to assess skills or performance in all situations where they may be useful to achieve organizational objectives. In the public administration, rating systems, as CESs, are used both for recruitment processes and for career advancement. The

individual performance of an employee is assessed by managers or external auditors against that of colleagues or previous activities carried out by the same employee (Llorens et al. 2018). An example of rating system of individuals is that implemented by the National Research Foundation (NRF) of South Africa. The NRF rating system provides a comparative evaluation of researchers with the goal of funding research activities in all fields (NRF 2018a). Its ratings are based on research outputs of researchers, considering their quality and impact as perceived by national and international peer reviewers (NRF 2018b). In particular, the reviewers analyze the quality of research outputs over previous years, the impact of research outputs on the field, the national and international standing of the researcher, and coherence of the researcher's work. The NRF rating system incorporates five categories, as shown in Table 1.

## Rating System for Organizations

The rating systems of public organizations are mainly intended for performance assessment of organizational behavior, quality of services provided to users, etc. They can be applied to different public organizations, such as hospitals, schools, local transport providers, universities, public research organizations, etc. (cf., Coccia 2005; Coccia and Rolfo 2010, 2013). The goal is to identify the best organizations in the provision of a service and to rank the various entities in terms of effectiveness and/or efficiency. An interesting example of rating system or CES for organizations is that of US hospitals (Hospital Compare 2018a, b). The overall rating of the Hospital Compare project summarizes up to 57 quality measures into a single star-based rating for each hospital. The methodology uses a statistical model known as *latent variable model* to calculate scores for seven categories:

1. Mortality
2. Safety of care
3. Readmission
4. Patient experience
5. Effectiveness of care
6. Timeliness of care
7. Efficient use of medical imaging

**Comparative Evaluation Systems, Table 1** National Research Foundation (NRF) of South Africa rating system for researchers

| Category | Description |
|---|---|
| A | Researchers who are unequivocally recognized by their peers as leading international scholars in their field for the high quality and impact of their recent research outputs. |
| B | Researchers who enjoy considerable international recognition by their peers for the high quality and impact of their recent research outputs. |
| C | Established researchers with a sustained recent record of productivity in the field who are recognized by their peers as having:<br>- Produced a body of quality work, the core of which has coherence and attests to ongoing engagement with the field<br>- Demonstrated the ability to conceptualize problems and apply research methods to investigating them. |
| P | Young researchers (normally younger than 35 years of age), who have held the doctorate or equivalent qualification for less than 5 years at the time of application and who, on the basis of exceptional potential demonstrated in their published doctoral work and/or their research outputs in their early postdoctoral careers, are considered likely to become future international leaders in their field. |
| Y | Young researchers (40 years or younger), who have held a doctorate or equivalent qualification for less than 5 years at the time of application, and who are recognized as having the potential to establish themselves as researchers within a 5-year period after evaluation, based on their performance and productivity of quality research outputs during their doctoral studies and/or early postdoctoral careers. |

Source: NRF 2018a, b

Each category (1–7) has a subsystem of indicators. For instance, the measures for category 7 "efficient use of medical imaging" are:

- Outpatients with low-back pain who had an MRI (magnetic resonance imaging) without trying recommended treatments first, such as physical therapy
- Outpatient CT (computed tomography) scans of the abdomen that were "combination" (double) scans
- Outpatient CT scans of the chest that were "combination" (double) scans
- Outpatients who got cardiac imaging stress tests before low-risk outpatient surgery
- Outpatients with brain CT scans who got a sinus CT scan at the same time

These indicators are collected over the same period of time and used to calculate the rating for each category (Hospital Compare 2018b). A summary score is then calculated for each hospital by taking the weighted average of these group scores. The overall rating, ranging from 1 to 5 stars, shows how well each hospital performed, on average, compared to other hospitals in the USA. The more stars, the better a hospital performed across the available quality measures. This rating system or CES helps people choose the best hospital to treat their specific condition or solve health problems. Figure 3 shows the steps of this star rating methodology.

## Rating System for Countries

Finally, rating systems or CES can also be applied to countries. An interesting example is the comparative evaluation of democracy level performed by Freedom House (2018), which is an independent organization dedicated to the expansion of freedom and democracy around the world. The information is useful for international investors, policy makers of international institutions, etc. Data for rating systems are collected by means of surveys measuring freedom according to two broad categories: political rights and civil

**Comparative Evaluation Systems, Fig. 3** Star rating methodology for US hospitals. Source: Hospital Quality Star Rating 2018

liberties. *Political rights* enable people to freely participate in the political process, including the right to vote for distinct alternatives in legitimate elections, compete for public office, join political parties and organizations, and elect representatives who have a decisive impact on public policies and are accountable to the electorate. *Civil liberties* concern freedom of expression and belief, associational and organizational rights, rule of law, and personal autonomy without interference by the state. In particular, the rating process is based on a checklist of 10 questions on political rights and 15 questions on civil liberties. The questions on political rights are grouped into three subcategories: Electoral process (3 questions), political pluralism and participation (4), and functioning of government (3). The questions on civil liberties are grouped into four subcategories: freedom of expression and belief (4 questions), associational and organizational rights (3), rule of law (4), and personal autonomy and individual rights (4). The survey operates under the assumption that freedom for all peoples is best achieved in liberal democratic societies. General characteristics of each political rights and civil liberties rating are as follows (Freedom House 2018).

**Political Rights**

**Rating of 1** – Countries and territories with a rating of 1 enjoy a wide range of political rights, including free and fair elections. Candidates who are elected actually rule, political parties are competitive, the opposition plays an important role and enjoys real power, and minority groups have reasonable self-government or can participate in the government through informal consensus.

**Rating of 2** – Countries and territories with a rating of 2 have slightly weaker political rights than those with a rating of 1 because of such factors as some political corruption, limits on the functioning of political parties and opposition groups, and foreign or military influence on politics.

**Ratings of 3, 4, 5** – Countries and territories with a rating of 3, 4, or 5 include those that moderately protect almost all political rights to those that more strongly protect some political rights while less strongly protecting others. The same factors that undermine freedom in countries with a rating of 2 may also weaken political rights in those with a rating of 3, 4, or 5, but to an increasingly greater extent at each successive rating.

**Rating of 6** – Countries and territories with a rating of 6 have very restricted political rights. They are ruled by one-party or military dictatorships, religious hierarchies, or autocrats. They may allow a few political rights, such as some representation or autonomy for minority groups, and a few are traditional monarchies that tolerate political discussion and accept public petitions.

**Rating of 7** – Countries and territories with a rating of 7 have few or no political rights because of severe government oppression, sometimes in combination with civil war. They may also lack an authoritative and functioning central government and suffer from extreme violence or warlord rule that dominates political power.

**Civil Liberties**

**Rating of 1** – Countries and territories with a rating of 1 enjoy a wide range of civil liberties, including freedom of expression, assembly, association, education, and religion. They have an established and generally fair system of the rule of law (including an independent judiciary), allow free

(continued)

economic activity, and tend to strive for equality of opportunity for everyone, including women and minority groups.

**Rating of 2** – Countries and territories with a rating of 2 have slightly weaker civil liberties than those with a rating of 1 because of such factors as some limits on media independence, restrictions on trade union activities, and discrimination against minority groups and women.

**Ratings of 3, 4, 5** – Countries and territories with a rating of 3, 4, or 5 include those that moderately protect almost all civil liberties to those that more strongly protect some civil liberties while less strongly protecting others. The same factors that undermine freedom in countries with a rating of 2 may also weaken civil liberties in those with a rating of 3, 4, or 5, but to an increasingly greater extent at each successive rating.

**Rating of 6** – Countries and territories with a rating of 6 have very restricted civil liberties. They strongly limit the rights of expression and association and frequently hold political prisoners. They may allow a few civil liberties, such as some religious and social freedoms, some highly restricted private business activity, and some open and free private discussion.

**Rating of 7** – Countries and territories with a rating of 7 have few or no civil liberties. They allow virtually no freedom of expression or association, do not protect the rights of detainees and prisoners, and often control or dominate most economic activity.

The survey includes both analytical reports and the above numerical ratings – on a scale from 1 to 7 – for 195 countries and 14 territories in relation to political rights and civil liberties. The arithmetic mean of these two ratings determines an overall status of "Free" "Partly Free" or "Not Free" as follows: countries scoring between 1.0 and 2.5 are considered *Free*, those scoring 3.0–5.0 are *Partly Free*, and countries with a score from 5.5 to 7.0 are *Not Free* (cf., Fig. 4). The two ratings are connected, in the sense that, without a well-developed civil society, it is difficult, if not impossible, to have an environment supportive of political rights. Consequently, there is no country in the survey with a rating of 6 or 7 for civil liberties and, at the same time, a rating of 1 or 2 for political rights. Figure 4 shows the results of this methodology over a sample of countries (Freedom House 2018).

## Conclusion

Comparative evaluation systems (CESs) are an important approach in public administration and other research fields, because they can provide vital information to stakeholders for supporting decision-making processes to achieve specific objectives. Rating systems are the most widespread typology of CES.

In general, rating systems – applied to individuals, organizations, and countries – can be represented by a sequential process comprising four main stages: data collection, measurement of characteristics, ranking, and rating of entities, as described in Fig. 5.

More specifically, Fig. 6 shows the construction of a rating system or CES that starts with a question or problem of evaluation, such as the performance of the best employees, the best organizations in providing services, or the countries with the best rule of law. The second step is data collection and measurement of characteristics concerning similar entities. After that, data analysis with specific techniques and methods provides a score for each entity to create a ranking of all entities. The last step is the rating (comparative evaluation) of entities to generate homogenous categories. The outputs are provided to stakeholders for decision-making processes supporting specific goals.

**Freedom index in the world**
(Selected countries)

| Country/ territory* | Freedom Status | Political rights | Civil liberties | Freedom rating | Aggregate score | Trend arrow |
|---|---|---|---|---|---|---|
| Finland | Free | 1 | 1 | 1 | 100 | |
| Canada | Free | 1 | 1 | 1 | 99 | |
| Japan | Free | 1 | 1 | 1 | 96 | |
| Germany | Free | 1 | 1 | 1 | 95 | |

Final ratings can be expressed by numbers (1, 2, 3, . . .) or letters (A, B, C, D) or a combination of numbers/letters/symbols (A1, A2, A+, BB−, etc.) in increasing and/or decreasing order. They have some general properties:

- Entities of higher rank have better performance (in terms of output, quality and/or good governance) than entities of lower rank. In general, the first numbers or letters in the ranking (e.g., A, A+, etc.) indicate the best performance.
- If different entities have the same rating, then they have similar characteristics and/or performance.
- Finally, it is possible to deduce the inventory of characteristics that are absent in the lowest rank entities by comparing them with the highest rank entities.

Overall, CES is a systematic process for data collection, measurement, and analysis of the characteristics of different entities to generate a final rating and support the decision-making processes of stakeholders to achieve specific goals. However, CES is a complex task because of manifold factors affecting entities that can change over time and space. To conclude, a comprehensive CES, affected by economic, social, psychological, anthropological, and perhaps biological factors of the entities under study, is a nontrivial exercise and can generate tentative results that need to be continuously verified over time.

# Comparative Federalism and Law

Alan Fenna
Curtin University, Perth, WA, Australia

## Synonyms

Federal systems; Federations; Intergovernmental relations; Judicial review

## Definition

A federal system of government is one where sovereignty is constitutionally shared and powers divided between an overarching central government and the governments of a set of constituent units, each of which enjoys a direct relationship with the people.

## Introduction

Federal systems of government, in the modern sense, have been in existence for over two centuries now – at least as long as the world has experienced liberal democracy – and historical antecedents go back much further. Federal systems of government also make up a good share of modern liberal democracies, particularly of the larger ones. With their attempt to use constitutional rules to enforce a system of shared rule they constitute a distinctive form of government, at least in principle fundamentally different from unitary systems, however decentralized those might be.

Federalism thus makes an important subject of study and the world's federations an interesting set of potential comparators. Although much research into federal systems is case specific, comparative federalism of some sort has a long history, and increasing effort is now being made to carry out systematic comparison. Going back at last to pioneering federalism scholar Edward Freeman (1863), there is a strong tradition of examining diverse federal experiences, oriented to using typologies with some eye to generalization and considerable effort at conceptualization (notably Wheare 1946; Sawer 1969; Duchacek 1970; Davis 1978; Elazar 1987; Burgess 2005; Watts 2008; Hueglin and Fenna 2015). Much of that effort has been dedicated to "telling the federal story" and thus providing the essential basis for any attempt at productive comparison. They are typically structured around the main facets of federal systems: origins; constitutional assignment of responsibilities; judicial review; second chambers; fiscal relations; and constitutional amendment.

This entry explores the way federalism has been studied both as a dependent and as an independent variable. As a dependent variable, scholars have sought to explain how federal systems emerge; how they maintain or lose their "federalness"; whether they succeed or fail; and how they function. As an independent variable, there is ongoing interest in determining what difference federalism makes to what governments do and how they do it. Much of the discussion of federalism as a dependent variable involves the complex relationship between underlying conditions and character; institutional structures of federalism; the extra-federal institutional characteristics; and political organizations and processes. Meanwhile discussion of federalism as an independent variable revolves around two competing claims: that, on the one hand, federalism obstructs policy making and that, on the other, it facilitates policy making.

With its basis in a constitutional division of powers, federal has from the very beginning had a close connexion with constitutionalism and, in turn, with constitutional law and its interpretation. This has prompted questions at times about the impact of judicial review on policy making by governments and an ongoing interest in the effect of judicial review on the longer run evolution of federal systems. Do supreme courts, or certain types of supreme court, retard or facilitate adaptation? What has their role been in maintaining the elusive "balance" that is often seen as being important to federalism?

As with social science research more generally, a comparative perspective, and better yet,

systematic comparative analysis, should be able to help us address all of these questions. The material covered in this overview shows that indeed the study of federalism has involved a healthy amount of general inference drawing as well as focused comparison between federal systems and some comparison between federal and nonfederal systems. As discussed below, however, potential for systematic comparison is severely constrained by the limitations of the material.

## Federalism and the Comparative Method

In a moment of enthusiasm, Freeman (1896, p. 1) described the comparative method as "the greatest intellectual achievement of our time." Both the attraction and the challenges of analysing federal systems comparatively were remarked on by William Riker (1964, pp. xi–xii). Federalism, he mused, "seemed . . . to be exactly the kind of subject about which we might easily utter testable generalizations."

> In time, however, I came to realize that this was far too pretentious a project for one man. . . .each instance of a federalism ancient and modern is embedded in a set of unique local institutions, which themselves must be appreciated and understood. To acquire the information about history, the sensitivity to culture, and the linguistic competence to examine all these societies is more than any isolated scholar can do.

The obstacles Riker identified are practical rather than principled and thus presumably surmountable, either by someone more capable than he or through collective scholarship. Understanding any federal system requires a richly contextualized understanding, but once established, such an understanding should provide the basis for successful comparative analysis. The real challenge arises with the constraints on reliable comparison. The problem is twofold: a small number of cases and the distinctiveness of each case.

### Methodological Challenges: Small *N*

Federalism is an ecumenical term, encompassing federal unions of a nongovernmental nature as well as governmental unions such as confederal systems that are not strictly speaking federal, as well as federal systems of government proper. Federal systems of government proper, which shall be the focus of this discussion, are distinguished from, on the one side, unitary systems or, on the other, confederal arrangements.

Traditionally, federations are categorized as such by reference to their constitutional framework and institutional form. This is as it should be, but it also carries the risk of mistaking appearance for reality and thus, as KC Wheare (1963, p. 20), the doyen of federal studies, reminded us:

> it is obvious that the practice of the constitution is more important almost than the law of the constitution. It is usually convenient to begin with the law, as a basis of classification.

On the one hand, some federations such as Malaysia or Austria are more federal in name than in substance (Rack 1996; Erk 2004; Case 2007). On the other hand, some such as Spain are more genuinely federal but give off sufficient mixed messages concerning their constitutional form to mislead some observers (Sala 2014). In a category of its own is the European Union (EU), which can be seen as a federation (Auer 2005), a federation-in-the-making (Annett 2010; Hueglin and Fenna 2015), or a distinctive model of "treaty federalism" (Hueglin 2013) – but which others see as not warranting the term at all (Wolinetz 2011). In between are those for whom the EU presents as an intriguing hybrid: a "jumbo confederation" (Lister 1996); an instance of "confederal federalism" (Kincaid 1999); a "quasi-federation" (McKay 2001); a "postmodern confederation" (Majone 2006); or even a "pluri-national federation *in sensu cosmopolitico*" (Dumont 2012). Questions about the precise status of the EU as some sort of federation have been brought to the fore by the challenges faced by the Eurozone in the global financial crisis and by the 2016 "Brexit" secession vote in the UK.

Thus, while it sometimes appears as if the world is awash in federations, with at least two dozen commonly said to exist, the search for genuine examples soon narrows the list down to a standard core and a handful of marginal cases. Federalism research, either comparative or case

specific, overwhelmingly focuses on the classical core of the United States, Switzerland, Germany, Canada, and Australia. India, the leading federation of the developing world as well as the most populous and most diverse federation, merits a place on that list but has not often been included in comparative studies. The net can be broadened to include Austria, Belgium, Spain, South Africa, Argentina, Brazil, Mexico, Malaysia, Nigeria, and the European Union, but each has caveats attached. It is certainly impossible to do meaningful quantitative comparisons of federal systems with such a small *N*, but it is even difficult to do reliable qualitative ones.

### Methodological Challenges: Great Variety

Even without the EU, variation among federal systems is considerable. This includes substantial differences in age, origins, design, and sociopolitical and economic contexts. If we mean federations in the modern sense of the term, as distinct from confederal arrangements, then federations range in age from the US system of the late eighteenth century to those such as Spain or South Africa created or being created in the late twentieth century. Having been established in 1949, the current German federal system is relatively young, but many of its features derive from an earlier incarnation in the late nineteenth century and indeed reflect a tradition going back to the middle ages.

The older federations – United States, Switzerland, Canada, Germany of the Second Reich, Australia – were all aggregative (though not necessarily purely so) in origin: formed by the voluntary union of formerly independent political entities. Much more recently we see federalism emerging out of a reverse process: unitary states such as Spain, Belgium, and South Africa devolving authority to accommodate diversity and local identities, often as a correlate of democratization. This contrast between aggregative and devolutionary origins is also referred to as "integrative" and devolutionary (Lenaerts 1990) or, less felicitously, "coming together" and "holding together."

While the constitutional design of each federation is, in detail, unique, there is a broad distinction that separates two basic design types (Scharpf 1988, pp. 242–243; Hueglin and Fenna 2015, pp. 51–55). On the one hand are those federations, of which the United States is the archetype, characterized by a legislative division of powers in which the respective levels of government exercise full powers to make, implement, and administer policy in assigned domains and that rely on an elected, "Senate"-style, second chamber giving the constituent units an equality of representation in national decision-making. Originally these were envisaged as functioning in what KC Wheare called a "coordinate" or dualistic way with the respective levels of government autonomous in their own spheres.

On the other hand is the German model of joint or integrated federalism, echoed in the EU and partly in the Swiss case, characterized by an "administrative" or functional division of powers where policies are framed centrally but implemented and administered by the constituent units, and an appointive "Council"-style federal chamber providing the constituent units with direct representation in central decision-making. Rather than coordinate or dualistic in design, they are based on joint decision-making. For this reason, the integrated model is sometimes alternatively referred to as "cooperative federalism" – an unfortunate practice given the different way that term has widely been used in the study of federalism (see below). Since the division of powers has become much more overlapping, concurrent, and integrated in the American-style federations over time, the "representation of state governments in the federal legislative arena is a decisive factor in joint federalism" (Thorlakson 2003, p. 17).

Finally, there is the socioeconomic make-up of each federation. Fundamentally, there is the distinction here between those with pluri- or multinational societies and those that are regionally monocultural (sometimes, rather unhelpfully, called "territorial" federations). Unsurprisingly, the dynamics of the two types are characteristically different. Language differences, such as exist in Switzerland, Belgium, India, Canada, or Spain, contribute greatly to creating the former.

All in all, the combination of small *N* and large variety helps explain why some scholars prefer not to think of federal vs. unitary states in dyadic terms and instead to approach their functioning by way of the looser concept of "multilevel governance." Whether this is justified or not, the reality remains that federal systems present difficulties for comparative analysis.

### Case Studies

Having earlier remarked on the opportunity federalism offered for systematic comparative analysis, it is thus not surprising that Riker (1975, p. 131) later retreated to a much less sanguine view. "Mature federations are more unlike than alike"; thus "it is probably impossible to generalize about the operation of federalism."

It is this sort of complexity that has caused scholars to flag the many obstacles to a reliable use of the comparative method in political science more generally. It is sometimes forgotten that pioneer theorist of the comparative method, John Stuart Mill (1974/1843), essentially rejected its application to the human sciences because of the "extraordinary" complexity of the variables. Since we will never be able to find two cases alike in all respects except the variable in question, we must rely on methods of comparison that cannot resolve problems of the "plurality of causes" ("equifinality," in modern jargon) or intermixed causes – "chemical causation," as Mill called it (on which see Ragin 1987). Mill (1974, p. 883) cautioned against "a specious semblance of conclusiveness" that comparative analysis can create in the social sciences. It is for this reason that "natural experiments" are the holy grail of comparative research since only they can provide some hope of holding the inevitably wide range of variables constant (Robinson et al. 2009). However, natural experiments are exceedingly rare.

Sober assessments of the comparative method more recently (e.g., Lieberson 1991) also focus on the difficulty of distinguishing multiple causes ("over determination") or interaction effects. While Przeworski and Teune (1970) downplayed these difficulties, Przeworski (2007) eventually conceded that problems such as "endogeneity" force us to ask whether a "science of comparative politics" is possible at all. Such issues go to the heart of the matter in the human sciences, returning us to the question of whether the nomothetic enterprise of a "social science" is really feasible or whether we must settle for a much less ambitious idiographic approach of traditional "history" that treats cases as largely *sui generis*.

This retreat to a much more realistic view about the capacity of comparative analysis is a further reminder of the crucial value of in-depth case studies and the "process tracing" analysis they engage in to reveal complex causal mechanisms (George and Bennett 2005). Case studies occupy, Gerring (2004, p. 352) suggests, a seemingly precarious ontological position midway between ideographic and nomothetic extremes – but precisely there may well be the reality of the human sciences. It is this dilemma that leads to a plea for matched pairs approach to comparison, which in some ways offers the greatest potential for dealing with complex variables (Tarrow 2010). Any fewer cases would allow no comparison; any more threatens to compromise on empirical richness. Paired comparisons have been used widely in the federalism literature: juxtaposing Canada and the United States, Canada and Australia, the EU and the United States, Canada and the EU, the United States and Switzerland, and indeed almost any other permutation one can imagine.

## Federalism as a Dependent Variable

Interest in federalism itself has focused on at least four different but related questions. The first is *origins*: why do some states emerge in a federal rather than unitary form? The second is survival, or more precisely, *failure*: why do some federations expire or dissolve? The third and fourth concern the *dynamics* of successful or established federal unions: how and why does the balance between centripetal and centrifugal tendencies change over time, and, more specifically, what role does judicial review play in the evolution of federal systems?

### Origins

Why some states took a federal rather than unitary path is an interesting question that also has bearing on the understanding of federal practice. In addition to helping understand the past and interpret the present, it also helps with envisioning the future: under what circumstances might federalism be a "solution" to present woes, such as unitary states fractured by conflicting regional identities (Wibbels 2006). Most reflection and research has focused on aggregative federations since they are older and more classically federal. The obvious first step has been to map the experience of precursors, the various confederal unions that have existed over the centuries, and about which, thanks to Davis (1978), Forsyth (1981), and Lister (1999, 2001), much is now well understood.

It has long been recognized, as Wheare (1946, pp. 37–45) originally spelled out, that some combination of external threat and economic gain has been instrumental in the formation of the main aggregative federations. Riker (1964, p. 12) turned the strategic gain notion into a formal proposition, but shorn of its nuances the idea lost rather than gained utility. Going beyond Riker's rather "commonplace" observation (Davis 1978, p. 137) has been difficult, though.

Empirically, an inviting comparison is between German and Italian unification in the 1870s. Although not at all a "natural experiment" (*contra* Ziblatt 2006: Chapter 1), since it does not control for other variables, these divergent forms of modern state formation make for a potentially illuminating contrast. Is there something about the fact that militarily powerful Prussia drew the German states into a federal union, while Piedmont presided over the formation of a unitary state in Italy? Wheare's answer was that federalism requires an established capacity for regional self-government. Italy could not federate until the autocracies of Sicily and Naples were abolished. "But when this defeat was accomplished, nothing was left. There were no governments with authority rooted in the society they governed." Ziblatt (2006) explored the comparison in more detail and arrived at the same conclusions.

Simple binary comparisons, as noted above, have their strengths; however, they also have their weaknesses. A critical weakness to the simple two-case comparison here is that while it helps us understand why modern Italy could *not* take a federal form, it cannot tell us why Germany *did*; "infrastructural capacity," as Ziblatt calls it, would certainly seem to be a necessary condition, but there can be no valid inference from this comparison that it is in any way a sufficient one. A host of other conditions almost certainly have to be met.

### Success and Failure

The flip side of explaining origins is explaining failure or the limits of federalism: presumably many of the same factors that make for federalism in the first place determine whether it will succeed or not. Wheare's list of "requisites" also included such factors as previous existence of the constituent units as autonomous political entities and similarity of social and political institutions.

Because federal union has often seemed like the ideal solution to state-building challenges, a sense of disappointment has long surrounded those instances where a federal vision has proved insufficient to the task, including instances of "total failure" (Hicks 1978). The general answer has been to infer from the broad experience what conditions are conducive to success, such as the number of units or the relationship between unit boundaries, the distribution of ethnic or other potentially troublesome minorities (Lemco 1991), or the experience of prior independence (Markovic 1995). Of particular interest is whether federalism assuages or, alternatively, amplifies regional discontent when genuine differences of identity are at issue. Is federalism the "solution" in divided societies, as Elazar (1987, p. 8) argued? Inferences from multicase surveys (Amoretti and Bermeo 2004, pp. 457–489; McGarry and O'Leary 2009; Seymour and Gagnon 2012; Anderson 2015) suggest that while generalization is difficult, federalism does assist in "managing cleavages" and that the notion that federalism exacerbates identity issues can only be sustained by overlooking patently incompatible conditions and creating illusory counterfactuals. Federalism is not a panacea (Erk 2015).

### Evolution and Erosion

Distinguishing "successful" from "unsuccessful" federations does not do justice to the quotidian but pervasive difficulties often experienced by the successful, established, federations. While the frictions of "cool" federalism are much less dramatic than those of its "hot" version (Sager 2005), they can nonetheless be a source of dissatisfaction. A widespread syndrome has been one of the creeping centralization and the resulting perception that federalism is being eroded in the established federations. Aggregative federations typically took shape through a process of debate and negotiation (misleading characterized by Riker as a "bargain") in which efforts were made to lock the relationship between the two levels of government into the desired form through constitutional arrangements. The question is how those arrangements subsequently evolved and what role they and the institutions they established played in that evolution.

For those unions formed prior to or in the early years of industrial modernization, powerful centripetal tendencies were inevitable, particularly but not only because of the way the emergence of national welfare states in the mid-twentieth century effectively reversed major elements of the traditional distribution of responsibilities (Corry 1941; Peterson 1995; Fenna 2007). In an influential formulation, Sawer (1976, p. 64) described this "as involving three successive stages; first co-ordinate or dual federalism, secondly co-operative federalism, and thirdly organic or integrated federalism." Attempts to map and compare centralizing trends show a tendency that spans quite different federal systems and indeed appears "ubiquitous" (Döring and Schnellenbach 2011), but which has nonetheless been variable (Krane 1988). An alternative reading sees periods of centralization and periods of decentralization (Chhibber and Kollman 2004, pp. 101–160).

This evolution, which in some instances has quite transformed the older federal systems, has more often than not taken place via sub-constitutional means: typically, a combination of favorable judicial interpretation and the exercise of fiscal power. There does, however, seem to be a characteristic division between the continental federations Switzerland and Germany, and the New World federations, in this respect, with the former making much more regular and effective use of formal constitutional amendment (Hueglin and Fenna 2015, pp. 275–307). For the latter, one can agree with Rodden (2006, p. 38) that "federal constitutions are notoriously poor guides to the distribution of authority in modern federations."

The institutional barriers to change in federal systems did retard this process of adaptation for some time, but once the dam was broken, it has seemed to some observers that there has been a very real possibility of moving from centralization to what Braun (2011) calls "overcentralization." Some attempt has been made to compare the degree of centralization across federations using fiscal indicators, with, unsurprisingly, Canada and Switzerland ranked the least, United States and Germany in the middle, and Australia and Austria the most (Thorlakson 2003).

The efficacy of federalism's constitutional constraints in resisting centripetal tendencies has been discussed at length by some scholars (Filippov et al. 2004; Bednar 2009), but with mixed results and, more to the point, little attempt at empirical validation and comparative analysis. Riker (1964, p. 101), who attached minimal significance to the institutional features, argued that "the decentralization of the two-party system is sufficient to prevent national leaders . . . from controlling their partisans by either organizational or ideological devices. As such, this decentralized party system is the main protector of the integrity of states in our federalism." However, this observation was based on little more than impressionistic argument. More systematic comparison reinforces the suspicion that parties should be regarded as merely an intervening variable and the party system a consequence rather than a cause of centralization (Chhibber and Kollman 2004, p. 227).

An alternative take on this variable asks not whether the party system is centralized, but whether it is Left-dominated. Parties of the Left are congenitally centralizing and where they enjoy a dominant position they will drive federations in that direction. Or so argue Turgeon and Wallner (2013), who illustrate their point with a two-case contrast between Australia and Canada.

That comparison provides useful *prima facie* evidence, but one would need other cases with the underlying characteristics of Australia but without its Labor Party to provide compelling demonstration.

One of the few attempts to address the general question of what drives centralization through an empirically richer multicase comparative analysis has been Erk (2007), who compares Austria, Belgium, Canada, Germany, and Switzerland. Erk found that having a federal society – i.e., one characterized by regional ethno-linguistic diversity – proves most resistant to centralization. This lent support to Livingston's (1952) well-known proposition that "Federalism is a function not of constitutions but of societies." Riker (1964, p. 111) similarly emphasized the role of "popular sentiment of loyalty" in determining which level of government will dominate. While confirming the importance of that societal diversity, Braun (2011) sought to supply a more nuanced reading, using much the same range of cases, but including variations in institutional structure. Similarly, Bolleyer (2009) explored some of these cases to determine how the varying ability of constituent units to cooperate might be explained and might affect federal dynamics.

## Courts and the Constitution

How effective have federalism's constitutional/institutional "safeguards" been in retarding those centralizing tendencies noted above? Of all the mooted institutional safeguards, it is the courts that have been most discussed. This, however, has overwhelmingly been done using an *N* of one – the United States. Can comparative analysis tell us anything about the contribution judicial review has made to the evolution of federal systems? Views about the significance of the courts range from Alexander Hamilton's blithe and rather disingenuous reassurance in Federalist 78 that the judiciary are the "least dangerous" branch (following Montesquieu), to Dicey's (1915, p. 170) dictum that federalism "means legalism – the predominance of the judiciary in the constitution." In the United States, legal scholars have long debated whether the Supreme Court should or can be expected to police the federal division of powers (e.g., Wechsler 1954; McGinnis and Somin 2004).

### Federalism and Constitutionalism

Federalism contributed significantly to the emergence and development of modern constitutionalism since the creation of federal unions inevitably entailed legal formalization of the negotiated arrangements. Along with "new beginnings," it was one of the two paths to modern constitutionalism (Ackerman 1997, p. 775). In some cases, such as Canada or Australia, federalism was a sufficient reason for the drafting of a modern constitution; in others, such as the United States, both factors were at work. Constitutionalism has thus been an important element of federal systems, manifesting itself in questions about amendment and other forms of adjustment to changing conditions such as interpretation and reinterpretation by the courts.

Almost without exception, federations have established higher courts either implicitly or explicitly mandated to assess the constitutionality of government actions and thus adjudicate conflicts over the division of powers. Thus federalism has also provided a major impetus for the development of judicial review. There was a great deal of truth to Dicey's observation – certainly more than there was to Hamilton's. Because of its reliance on (and contribution to) constitutionalism, and because of its unique attempt at creating some kind of shared sovereignty, federalism almost inevitably created a privileged role for the courts. Indeed, as embodied in the landmark *Marbury v. Madison* (1803) decision of the US Supreme Court, federalism was instrumental in the rise of *judicial review*: the then-controversial and path-breaking notion that the judiciary may declare the actions of government unconstitutional.

Judicial review spread to the Anglo federations Canada and Australia but because of very different associations and conditions was slower coming to the European states. By the second half of the twentieth century, though, it had become the international norm (and of course not just in federal systems) a status reflected in the contribution

made by the European Court of Justice to the consolidation of the European Union. Characteristic differences remain, with the New World federations reposing the task in a general court of appeal – the Supreme Court of the United States or of Canada or the High Court of Australia – while the German model is one of a specialist constitutional court, the *Bundesverfassungsgericht*. There is, however, one distinct anomaly: Switzerland, the one federation where the jurisdictional scope of the national government is not subject to judicial review at all (though actions of the cantons are subject to the Federal Court). Switzerland's unique reliance on direct democracy has made judicial review of central government actions seemingly unnecessary.

### The Judicial Safeguards of Federalism?

Up until the second half of the twentieth century it was common to deplore the constraint judicial review was imposing on the expansion of central government powers and the way courts were so conservatively deferential to federalism. More recently, supreme courts have been accused of the opposite: of betraying federalism and being complicit in the centralization of power that has occurred in the established federations. Scant attention has, however, been paid to these questions by comparativists. One exception is Bzdera (1993), who compared Switzerland, Canada, the United States, Australia, and the EU, concluding from their experiences that, without exception, supreme courts "are best characterized as centralist and nationalist."

> This net centralist/nationalist bias of federal high courts is largely explained by the strong institutional factors linking such courts to the political organs of the central government. This government is generally responsible for the existence of the court, its administration, its budget, its internal procedures, and most notably for the selection of its judges. (Bzdera 1993, p. 27)

Highly suggestive for Bzdera was the way the court least beholden to the central government, the Judicial Committee of the Privy Council in London during the formative years of Canadian federalism, played a pronounced decentralizing role. The Judicial Committee was an Imperial instrument serving as the final court of appeal for Canadian federalism until 1949. Entirely external and independent, it manifestly favored a federal rather than a centralizing interpretation of what was intended to be a quite centralizing constitution.

Of course, periodization is a crucial component of such an analysis: the building phase of a federal union is presumably rather different from more mature phases. Thus, obversely, we might expect courts to play a centralizing role in "constituting" an integrated union when faced with disparate elements. Thus Goldstein (2001), for instance, compares the role of the European Court of Justice with the US Supreme Court in its early years. More generally, comparison of the EU with other federations in their earlier days has been a natural avenue of research (e.g., Church and Dardanelli 2005; Jabko 2006).

If this argument about courts and centralization is correct, we should find an inverse correlation between the central government's control over the court and the degree to which the court defends federalism. And some such correlation can be discerned (Aroney and Kincaid 2016). Centrally dominated supreme courts in Australia and the United States have assumed a deferentially centralizing role. By contrast, the supreme courts of the German and Swiss federations, constituted with much greater respect for the federal principle, have adopted a more balanced position – with the Swiss Federal Court (*Tribunal fédéral/Bundesgericht*) demonstrating that balance in the license it extends to the cantons (Lienhard et al. 2016). Of course, these are merely correlations and in no way control for the possible influence of a wide range of other factors. It is also not inconsistent with the recognition that judicial review functions via internal intellectual logics encapsulated in the notion of interpretive "doctrine" (Baier 2006).

## Governing Federal Systems

An enormous amount of the work done on federal systems concerns the practical questions about the

mechanics of cooperation and conflict when two constitutionally entrenched levels of government interact, as over the course of the last century they have increasingly had to do (Poirier et al. 2015). This has two main dimensions: fiscal and political–administrative, the latter coming under the rubric of intergovernmental relations, or "IGR."

### Fiscal Federalism

Comparative analysis of the fiscal relations between governments in federal systems is limited. One exception is Rodden's (2006, p. 272) survey of the "murky semi-sovereignty" that characterizes the spending and borrowing position of the constituent units in federal systems and the possible "hazard" this poses for public finance. Very little comparative work has been done on what is perhaps a more important aspect of fiscal federalism, *viz*., vertical fiscal imbalance (VFI) and the use of conditional grants by central governments. The significance of VFI lies chiefly in the way it allows central governments to "encroach" on the constitutional prerogatives of the constituent units by use of the "spending power." Some comparative work has been done on horizontal fiscal equalization (HFE), the subsidization of less well-off jurisdictions to maintain comparability of government services across the country (Béland and Lecours 2011, 2014). Equalization varies considerably from federation to federation – particularly in degree but also in manner. Some federations equalize thoroughly or aggressively (Australia, Germany); some equalize partially (Canada, Switzerland); and one does very little at all (the United States).

### Intergovernmental Relations

The growth and consolidation of intergovernmental relations in the traditional dualistic federations over the twentieth century has long been studied under the rubric of "cooperative federalism." As Elazar (1991, p. 69) noted, "the adjective *cooperative*. . .does not imply that intergovernmental relations are always peaceful and friendly. . . . *Cooperative* refers to the fact that governments must *cooperate*, that is, work and function together." The story of cooperative federalism encompasses a wide range of interactions including negotiation, conflict, coercion, and genuine cooperation. It can also involve practices of "collaborative federalism," *viz*., the establishment of joint governance arrangements (Painter 2001).

Intergovernmental relations, however, are the most elusive subject in the study of federalism. Lacking the explicit legal form of constitutions and judicial interpretation, the explicit numerical quality of fiscal relations, or the tangible shape of constitutionally mandated institutions, they occupy a distinctly gray area. Comparison generates some systemic distinctions, such as that between "executive federalism" and "administrative federalism." Parliamentary federations with a legislative division of powers generate high levels of executive-to-executive interaction that has been termed "executive federalism" (Watts 1989). Both US federalism, with its presidential separation of powers, and German federalism, with its administrative division of powers, give rise to more diffuse interaction, often at the bureaucratic levels, that has been termed "administrative federalism" (Fenna 2012; Hueglin and Fenna 2015, pp. 239–246).

Comparing the very different processes in the American and Canadian systems, Bakvis and Brown (2010) find that outcomes are nonetheless similar. It is reasonable to expect, though, that presidentialism and parliamentarism will have characteristically different effects on the way a federal system functions. Comparing four federations, Kelemen (2000) found that to indeed be the case for environmental policy: the inherent weaknesses of presidential separation of powers arrangements leads to imposition of tight regulatory frameworks on the constituent units in a way that does not tend to happen in parliamentary systems. Again, such findings are hostage to the shortage of comparative material. Presidential systems are generally rare in the world of successful liberal democracies and specifically rare in the world of successful democratic federations. This requires Kelemen to use the EU as a functional equivalent to the United States.

### Reform

This evolution of modern federalism, with its increasing entanglement of the two levels of

government and degree of convergence between the way powers are divided in the dual and integrated federations, has created a challenge for modern federal governance. It has also generated characteristic reform strategies in the two types of federations. Legislative federations have sought to strengthen shared rule in response to the increased sharing, while administrative federations have moved towards disentanglement (Broschek 2015).

## Federalism as an Independent Variable

What difference does having a federal system make? Riker's answer was "very little," and then only to the style rather than the substance of what governments do. Davis (1978, pp. 212–213) was, if anything, more sceptical – declaring that the term "federalism" had become "phylogenetically senile." On the other hand, bold claims and strong criticisms have been made about federalism over the years, including that it protects individual rights, provides a way to accommodate diversity, retards policy making, and facilitates policy making. Here the logical approach is, as Riker (1969, p. 139) suggested, a matched-pairs design, juxtaposing "most (otherwise) similar" federal and unitary systems. Short of a genuine natural experiment, the problem here of course is that the available material provides few opportunities for anything but the most approximate "matching."

### Federalism as Hindrance?

Does divided jurisdiction help, hinder, or make little difference to effective governance and the introduction of new policies? In particular, focus has been on the potential for market-modifying policies. The short answer seems to be "all of the above": federalism has or can help, hinder, or make little difference to reformist policy, depending on circumstances.

Writing when US federalism was proving a significant obstacle to policy reform for a rapidly industrializing society, Dicey (1915, p. 169) declared that a system of divided jurisdiction "is unfavourable to the interference or activity of government." The assessment was echoed less dispassionately in the years of the Great Depression, most famously by English socialist Harold Laski (1939). For Dicey, Laski, and others, the main culprit was misalignment between responsibilities and capacities combined with the power of the courts to veto any kind of adjustment through initiatives of the national government. At its extreme, this took the form of the perverse situation created in the *Lochner* era of constitutional interpretation in the United States that neither level of government was granted power to regulate the market (Kens 1998).

All of this discussion and handwringing implicitly assumed federalism of the American type that is a legislative rather than administrative division of powers. Jurisdictional impasse would self-evidently not be the same problem in federalism of the German type. But "joint-decision" systems may well fall prey to their own pathologies, and according to Fritz Scharpf (1988), they indeed are, but of a different kind. In this view, Germany and the EU are afflicted with tendencies to a policy and institutional reform inertia Scharpf called the "joint-decision trap." This syndrome arises when unanimity among too many decision makers is officially or effectively required. The proposition has been explored through empirical work and comparative reflection (Héritier 1999; Benz 2011; Falkner 2011).

The question of federalism's impact on market-modifying initiatives was looked at in empirical depth in a comparative analysis of the emergence of welfare states in Australia, Canada, the United States, Austria, and Switzerland (Obinger et al. 2005). That analysis corresponded to the approach recommended by King et al. (1994, p. 45) as "structured, focused comparison." It confirmed the contribution federalism made to retarding the development of modern welfare states in some of these cases, but also noted the extent to which that was a one-off event and the extent to which other contributing factors have been at work. In the US system, for instance, it is easy to confuse the effect of federalism with the effect of extraneous institutional characteristics, notably the presidential separation of powers design of the national government (Greer 2010).

In the United States, it is also easy to confuse the effects of federalism with the effects of some of the underlying circumstances associated with federalism, notably the conservative pulls of the South (Finegold 2005).

Some of the adverse dynamics of federalism in development of redistributive social policy also seem evident in the environmental field. Comparing Switzerland, Canada, the United States, and the EU, Weibust (2009) found that centralization of powers in this area rescued the country from debilitating collective action problems of a decentralized system. At the same time, other comparative analyses of the impact of federalism on environmental policy find little scope for generalization, partly because each federation is different – both in the nuances of its federal structure and in other, extraneous, factors (e.g., Harrison 2010). Meanwhile, Banaszek (1996) compared women's suffrage in Switzerland and the United States – two federal systems with contrasting outcomes – and quite absolved divided jurisdiction from any particular outcome responsibility. In her comparison, it was not intra-federal variation that explained the contrasting outcomes, but entirely extra-federal factors, notably the misguided strategies chosen by the Swiss suffragette movement itself.

### Federalism as Facilitator

On the other side of the ledger is the claim that federalism enhances policy making. In the "laboratory federalism" thesis, one of the great virtues of having several independent jurisdictions and two levels of government is the much greater opportunity for policy "experimentation" and learning. As first proposed by James Bryce (1893, p. 353) and later promoted by Justice Brandeis (1932) of the US Supreme Court, federalism creates "laboratories of democracy" wherein unsuccessful experiments are safely quarantined and whereby successful ones can be emulated. The thesis is attractive but does the vaunted experimentation and learning actually occur in practice – and to the extent it does occur, under what specific circumstances?

Theoretical doubts about the likelihood of such a beneficent dynamic have been widely voiced (e.g., Strumpf 2002), but much less has been done to test the proposition empirically. Some systematic research has been done in the United States, where most of the interest in the thesis is focused. Findings have highlighted the proposition's rather idealistic nature, consistent with the judgments of the more theoretical literature on the subject. "The characterization of the 50 states as laboratories of democracy is an appealing image, but it is a standard that is rarely met in practice" (Karch 2007, p. 204). Little effort, however, has been made to move beyond the single-case perspective on this question. Two types of comparison are required: a comparison of federal and unitary systems, as Riker suggested, to provide some better indication of whether federalism does indeed exhibit experimentation and learning tendencies, and a comparison of different federations to give some indication of what intra- or extra-federal characteristics contribute to or negate those putative tendencies.

An illustration of the former is Chappell and Curtin (2013) who follow Riker's (1969, pp. 139–140) advice and utilize the Australia–New Zealand comparison to explore the difference between a federal and a unitary system enjoying otherwise substantial similarities. They found that divided jurisdiction did indeed provide greater opportunities for progressive initiatives. As far as the latter is concerned, there is the distinct possibility, as Pierson (1995) argued, that "federalism" is too crude an independent variable and that it is particular features of specific federal systems that we must examine. Evidence suggests that, indeed, a great deal of contingency is involved (Wälti 2013).

## Conclusion

As in the social sciences generally, meaningful comparison is the methodological holy grail of federal studies. Federations are a significant subset of liberal democratic governance types and should provide us with the scope to explore and test ideas about either the way federal systems change and evolve (federalism as dependent variable) or the way federal systems affect

the practices of politics and policy making (federalism as independent variable). The challenges, though, are considerable: the number of cases is small, and the degree of variance is large. As the above survey demonstrates, comparative efforts have focused overwhelmingly on the usual suspects: that small handful of stable liberal democracies with well-established formally and substantively federal systems. The United States, Switzerland, Canada, Australia, and Germany are the analytic elect. Increasingly, the EU is being added to the mix – despite, as we noted, ambivalence about its federalness. Outlying cases, such as failed federations, become relevant and useful for specific purposes.

Riker's slightly whimsical notion of testing the significance of federalism by focusing on paired comparisons contrasting on the independent variable has not, with the occasional nicely suggestive exception, proven fertile for the simple reason that such matched pairs do not exist in the real world. The notion is, as Mill (1974, p. 882) noted, "manifestly absurd" since, to paraphrase Mill, if two countries were alike in every respect other than the structure of their system of government, they would be alike in that respect too. Examining either the fate of federalism as a dependent variable or the impact of variations in federal and related governmental structures does not entail unitary–federal comparison. Here, the problem is paucity of material, with analyses forced to rely on only one case of separation of powers federalism (the United States) and only a modest number of parliamentary federations, or one case of integrated federalism (Germany) and some partial examples (Switzerland, EU) or only a modest number of dualistic ones. Nonetheless, interesting and suggestive work has been done using these limited resources.

# Comparative Fiscal Policies

Anette Bonifant Cisneros[1] and
Roberto Galván Avalos[2]
[1]University of York, York, UK
[2]Cornell University, Ithaca, NY, USA

## Synonyms

Comparative public finance; Comparative revenue policies; Comparative tax policy; Revenue collection policy; Tax policy

## Definition

Fiscal policy is a macroeconomic tool employed by governments to promote growth and stability of public finances. Comparative studies analyze the variance that these policies present among countries and different levels of government.

## Introduction

Economic theory is divided into two areas of study: microeconomics and macroeconomics. The latter studies global indicators, such as the aggregated production of final goods and services (commonly called the Gross Domestic Product, or GDP), income, expenditure, unemployment, interest rate, international trade balance, among other variables. The implementation of macroeconomics policies relies on two tools: monetary policy and fiscal policy (Friedman and Heller 1969; Shaw 1972). Typically, people have more awareness of fiscal policy, as it mainly operates through taxes and social spending, which are variables that directly affect household budgets. Moreover, within a country, fiscal policies can vary across central and local governments: the central government implements actions that affect the entire population, while local governments implement policies that primarily affect citizens in the region. Despite this, the objective remains the same, to promote the economic stability of the region and, consequently, of the government administration.

Currently, most of the countries and international organizations that advise them compare the fiscal policies adopted worldwide, in order to evaluate the effectiveness of implemented policies. Also, global differences are considered during the implementation of a policy framework, as each region has their own particularities in terms of government system and economic strength. Not comparing existing policies could increase the likelihood of policy failure and even prove counterproductive for the region. Therefore, comparative fiscal policy can lead to a better understanding of variables and actions that affect the economic performance of countries and different levels of governments.

## Main Features of Fiscal Policies

In terms of macroeconomic studies, fiscal policy is closely interrelated with monetary policy in

aiming to affect economic performance. In an economy undergoing adverse circumstances, the government can increase available money by decreasing the interest rates or by buying its own bonds. The ultimate purpose of this strategy is to provide money to citizens to increase consumption, which commonly will reactivate the economy. On the other hand, if the government raises interest rates or issues bonds, it will result in excessive currency flows into the economy, making it more expensive to consume as people will have less money. This is a consequence of supply/demand laws–more available money decreases its cost, while less available money increases its cost.

The second alternative is to implement strategies affecting government income and spending. In contrast to monetary policy decisions, which are typically made by the central bank, fiscal policy decisions are the remit of executive and legislative (congress) branches of government. In this sense, when the economy is experiencing recession, with growth rates decreasing or stagnant, the government can reduce taxes. With this, both private sectors and citizens will have more available money to spend. Also, the government can increase its level of spending, by buying goods and services such as hospital equipment and providing lighting for public spaces. In this way, the government expenditure creates the need for more workers in sectors where public money is allocated, and more available money flows at both households and private sector levels, thus reactivating the economy.

On the other hand, the government can do the reverse when the economy is booming and there is a risk of inflationary behavior. Under this scenario an excess of money supply results in local currency losing its acquisitive power, thus people in the future have to pay more for exactly the same products. For example, a bus ticket costingUS$1 yesterday is now valued at US$1.5, because the dollar of yesterday is no longer enough to consume the same amount of goods today. In that case, the government will follow a countercyclical policy, raising tax rates or decreasing its spending level, leading to lower levels of circulating money.

Although the above seems straightforward, setting taxes and optimal spending is a difficult task. On the one hand, taxes must be progressive. For example, people may be taxed according to the level of wealth, thus people who are wealthy are required to pay higher tax rates based on the level of income. They should also be congruent (i.e., multinational producers of non-nutritious food pay higher rates than local producers of fruits and vegetables).Regarding social spending, resources must be distributed according to areas that generate the greatest social benefit, such as education (mandatory education and research and development), health care and childcare. Also, this type of spending must be channeled to address population needs which without government intervention would remain unmet.

The selection of fiscal policy mechanisms must consider the positive or negative consequences they entail. In the case of taxes, these consequences are called externalities. For example, concerns about climate change encourage some governments to tax individuals and companies that emit high levels of greenhouse gases. This tax generates a positive externality because it discourages the producers from polluting, and also the resources obtained can be used to alleviate pollution. Another example of positive externality concerns taxing sugary drinks. As these products become more expensive, the amount consumed decreases, allowing taxes to be reinvested to combat diseases such as diabetes. This approach related to positive externalities and taxes can also be applied to areas that generate benefits for citizens such as education, competitiveness, and innovation (Stiglitz and Rosengrand 2015). In these areas governments are prone to introduce tax deduction on tuition fees, and activities of research and development in order to encourage the development of human, technological, and economic potential.

Another positive aspect of fiscal policy is that benefits can be targeted to specific groups in society. In contrast to monetary policy, where results are applied to the economy as a whole, fiscal policy can be designed to benefit or affect only specific population groups. Taking the example of pollution, taxes for polluters are not transferred to

those that behave in an environmentally friendly way. Concerning spending, the government can use mechanisms to shift resources to specific economic sectors. In situations of excess labor supply and limited demand (i.e., too many workers and too little construction), the government can build a new highway or rail line to provide employment for these workers.

Fiscal policy has the benefit of producing immediate effects, whereas monetary policy effects are typically seen in the medium or long run. For example, it is easier to establish a tax exemption that allows targeted companies to consume more immediately. In contrast, using monetary policy the government would have to decrease interest rates, allowing companies greater access to credit and new resources for consumption. However, as it has been said, the process of adjusting interest rates is not immediate, and the companies will have to wait until investors realize that it is more profitable to invest in the private sector. Also, the consequences of changes in the interest rates will affect the entire economy and not only target companies of a specific sector.

However, poorly devised and implemented fiscal policy could have negative consequences; even a well-intentioned fiscal policy can be harmful. In this sense, fiscal policies are typically linked to political agendas and potential tax increases might not be welcomed by citizens or private sector interests. Similarly, spending cuts may not be popular if they lead to workers losing their jobs, or citizens receiving fewer benefits (whether cuts in direct subsidies or reduced spending on social sectors).Therefore, fiscal policy might not be introduced because of political costs, with potentially effective long-term policy benefits being traded off against short-term political gains.

One final consequence of fiscal policy is that it may lead to a deficit, which means that the spending was higher than income for a given year. There are only two ways to finance a deficit: use your own savings or borrow money or borrow money from third parties. Nevertheless, a deficit is justified and acceptable if such savings or loans have been used to meet the demands of citizens or an infrastructure project that required an extraordinary amount of investment. However, some governments have used it as a tool for long periods. That implies that they will exhaust their savings or will have to keep borrowing resources indefinitely.

The above has two potential consequences for governments. Firstly, having no savings gives reduced capacity to face unforeseen contingencies. Secondly, it may lead to an unsustainable level of future debt, and so in order to pay the loan, government increase taxes disproportionately generating uncertainty for citizen and private sector budgets. Therefore, proper fiscal policies will reduce the likelihood of future deficits.

## Comparative Fiscal Policies among Different Levels of Government

There are large differences between fiscal policies carried out by different levels of government. This is due to the type of taxes that each imposes, and the magnitude and specificity of spending. While central government establishes national taxes and expenditure policies, local governments (typically states and municipalities) may impose their own taxes and set expenditure whose effects apply only to residents.

Central government taxes are applicable to the entire population of the country and, in principle, have a uniform rate, regardless of the region where the taxpayer lives. This prevents arbitrage opportunities that would arise for citizens, whereby they could change their residence in order to pay a lower tax rate or avoid paying special and regional taxes. Although there are exceptional cases where lower tax rates apply to specific regions, this tends to be implemented with the sole aim of promoting the local economies, without encouraging tax evasion.

For example, income tax is normally set by the central government, although local governments in some countries also levy taxes on incomes. Income tax is levied on net income and capital gains of individuals. In most countries it is progressive, people pay greater tax rates according to their tax base which is defined according to their

level of income, differing from a proportional tax which keeps the same rate despite the taxable base. In 2014, the average income tax for Organization for Economic Cooperation and Development (OECD) countries represented 8.42% of the GDP (OECD 2017). Other taxes commonly collected by central governments are related to consumption, most common being the Good and Services Tax (GST),also called Value-Added Tax (VAT), which tax the consumption of final goods, including food, medicine, and clothing. It also taxes the use of services, for example, hairdressing, dental care, and vehicle maintenance. The GST average for OECD countries was 10.97% of GDP (OECD 2017).

Moreover, local governments also impose taxes on consumption, although they are generally an extension or addition to central taxes. These taxes could be applied to goods and services consumed in specific regions, such as taxes applied to hotels or entertainment in tourist areas. Another example is tolls paid when vehicles enter urban areas. Finally, the vehicle tax is a common local tax, since there are regions where not only cars are taxed, but also motorcycles, tractors, boats, and yachts.

Property tax is also commonly imposed by local governments. If the central government decided to administer the property tax, it would have to know complete information about the characteristics of each property within the country. This is not only related to the size of any state, but to the commercial capabilities of the region. This represents great administrative work and cost for central governments. Therefore, local governments have comparative advantages in levying property taxes, as they have greater information regarding the characteristics of the land within their own territories. In 2014, the average property tax for the OECD countries was 1.86% of GDP (OECD 2017). However, it suggests a significant difference between the magnitude of the taxes levied by central and local governments.

In general, local governments are in close contact with people, so better understand their needs. As a result in federal systems, the fiscal policy of central government spending is geared primarily to sustaining the macroeconomic stability of the country, while local fiscal policy meets the demands of citizens. However, this is not always the case. Central governments may also seek to address population basic needs in terms of health, education, or housing, for example, by building the required infrastructure such as a new hospital or creating new programs of social assistance, as the local governments might lack resources to undertake large investments or program development. Also, similar to central government, local government can also incur deficit, which may allow the use of fiscal policy tools to ensure local economic stability.

Local governments have autonomy to define the allocation of its resources, although the degree of fiscal autonomy depends on the political structure of each country. The more autonomy local governments have, the less interference from the central government in making fiscal policy decisions. However, there is a potential problem of vertical fiscal imbalances. There are several countries where the collection of taxes is carried out by the central government, which reallocates those resources to local governments, through a system of specified rules. However, because of the autonomy of local governments, they are free to define the way resources are spent. On the other hand, there is an incentive problem, since the local government does not make an effort to collect taxes, but it spends them freely and irresponsibly on some occasions.

The World Bank (WB 2009) points out that the elimination of vertical fiscal imbalances is possible as long as the grant system has a clear objective, defining the specific use of resources and allocating them based on historical evidence. The grant system must also be fully transparent so that any local government has the same opportunity to compete for additional resources. Moreover, the system must be equitable, implementing equalization mechanisms to compensate for horizontal disparities in different regions. This ensures incentives align. First, it makes local governments aware of the significant efforts that must be devoted to collect taxes. Second, it encourages them to use the resources to obtain greater benefits in the future, and avoid having to generate additional income to offset the loss of profits.

## Comparative Studies as a Technique for Fiscal Policy

Fiscal policy measures are not considered a single instrument applicable to all countries or regions. For this reason, a comparative approach presents opportunities to broaden the knowledge of measures and government activities that impact fiscal policy performance, or as some authors suggest, the study of a series of non-decisions that alter outcomes (Baumgartner et al. 2008). In this sense, comparative studies in social sciences make reference to techniques through which policies, politics, and societies across regions are analyzed by undertaking comparison. Recognizing the different alternatives that can be taken by the government to induce optimal economic performance, the comparative approach is a tool that evaluates the distinct alternatives undertaken by other governments at any level in an effort to introduce changes or retain a current policy. This can be undertaken in both the evaluation of fiscal policy as a whole or through assessing its components by specific area such as taxation or public debt.

Economists have found comparing economic policies a fundamental interest (Halm 1968), due to the feasibility of transferring knowledge to implementing new fiscal policies or reforming current ones. The transmission of elements, ideas, and general knowledge is aided by the access to international data and documents currently managed in diverse forums and international institutions. However, in the case of economic policies the approach from a comparative analysis standpoint recognizes that economic model must be tailored to local needs. Moreover, for fiscal policy, the geopolitical context is a key element when implementing policy and evaluating the outcomes, considering local decisions that alter outcomes (Shaw 1972). For example, the comparative approach has found that policies carried out in the European Union in terms of public deficit have differed in outcomes due to political values and ideology.

Beyond considering a unique economic model or a single framework, there are several fields within fiscal policy where comparative studies can be carried out. In a general way, it leads governments to assess the social costs associated with a certain fiscal policy adopted, i.e., by contrasting the welfare loss due to distortionary taxes, or allowing the assessment of the effectiveness of measures carried out within regions, such as fiscal system harmonization within the European Union.

Moreover, comparative fiscal policies can be used not only at the international level but within nations at the local level. This allows government to evaluate the impact of different variables on fiscal policy across local governments (such as potential tax collection) in a more systematic way (Baumgartner et al. 2008). In order to consider the comparative approach, governments and policy makers must have access to information provided by the government entities in charge of accountability, for example, local ministries of finance and audit offices.

Precise information plays a key role in implementing strategies regarding public finance. More often, international organizations have considered the inclusion of economic data sets. These are the source of information to assess the performance of the elements of a fiscal policy and predict outcomes of certain variables within a current or proposed framework for different countries (Debrun et al. 2013). Among the most robust databases used widely are those presented by the International Monetary Fund (IMF), OECD, and World Bank (WB). Nevertheless, federal authorities also produce public information regarding tax and expenditure. This is the case, for example, of the Mexican National Institute of Statistics and Geography (INEGI by its acronym in Spanish), which provides information that is used to make comparative fiscal policies at local levels (either state or municipal).

## Comparative Fiscal Policy: The Perspective of International Governance

From 1944 onwards, preventing global economic uncertainty has been a shared focus. The institutions of Bretton Woods (IMF and WB) view stability as fostered through technical assistance to countries facing solvency problems (Woods

2007). The reason is that policies are not aligned with the needs of the economic system, and could threaten its stability instead of producing positive outcomes. Both institutions undertake intensive training through missions that allow governments to recognize advantages or disadvantages when dealing with economic issues. As policy makers or facilitators, these institutions gain understanding regarding the construction of specific national accounts in order to make the most precise data interpretation.

Nevertheless, the construction of a comparative fiscal policy has helped these institutions provide recommendations, leaving aside the concern that a fiscal policy can be applied homogeneously across countries, and that the unique alternative in the process of implementing a fiscal policy framework can be either expansive or restrictive. In a more explicit way, these institutions have used extensive comparative fiscal policy to consider further action in specific countries and local governments. The reasoning for applying a specific fiscal policy is made using robust datasets, geopolitical knowledge, and economic theory in tailoring fiscal measures. However, the introduction of alternatives in fiscal policy must be approved by local governments, recognizing that the common aim of any institution or government is to stabilize the Gross Domestic Product and ameliorate unemployment rates and fiscal imbalances.

## Conclusion

As discussed through the article, increases and decreases in tax levels and spending areas are the main levers of fiscal policy. If fiscal policy is employed appropriately, it can generate important benefits. Fiscal policy allows governments to channel the objectives and benefits to specific sectors of the population, which means a direct impact of policy outcomes on population in the short term. Likewise, there are different types of taxes and social spending according to the level of government. In federal systems, central governments seek macroeconomic stability, while local governments seek the welfare of the population, although roles might be modified in certain circumstances and differ from alternative types of governments such as a unitary parliamentary system. However, if fiscal policy is not well designed, there may be vertical fiscal imbalances. Therefore, a well-designed, transparent, equalizing, and inclusive grant system is required to ensure the alignment of incentives among distinct levels of government.

Moreover, comparative techniques in fiscal policy are used to create recommendations by international institutions and research institutes. By assessing the introduction of these innovations or reforms, governments can receive advice about the impact of changes to occur within the territory. However, given the complexity of economic policy, comparative intelligence does not lead to the same results among governments. Fiscal policy remains politically and electorally sensitive because government income, spending, and debt have direct impacts on the population. More widely, fiscal policy may lead to policy scenarios that might damage the macroeconomic performance of a country.

# Comparative Health Policies

Cheryl A. Camillo
Johnson-Shoyama Graduate School of Public Policy, University of Regina, Regina, Canada

## Synonyms

Comparative health policy analysis; Health policy exchange

## Definition

The study, using qualitative and/or quantitative methods, of two or more policies or policy alternatives pertaining to the maintenance, improvement, or restoration of the health of an individual or population, along with their policymaking contexts, for the purposes of deepening understanding, clarifying differences, identifying possible reforms, and/or accomplishing political objectives.

## Introduction

Health policy, unlike many policy issues, is deeply and personally important to most individuals. It is also important to communities because the health sector is among the largest at each level of government.

While the world's industrialized countries share the same general conception of health (as well as similarly high standards of living), their health systems finance, regulate, and deliver care differently. As a result, there are many opportunities for policy learning across systems.

This chapter describes the complex field of health policy in industrialized nations, with an emphasis on Canada and the United States (USA), and discusses its comparative study.

## Health Policy

### Policy Definition

*Policy* is the course of activities/actions/inactions, declared or undeclared, pursued by an actor or group of actors, typically after being selected from a set of alternatives, to address a problem. A *problem* is a situation, temporary or lasting, that imposes negative outputs or outcomes, small or large, on individuals, groups of individuals, or the public at large.

Policy is made using a variety of instruments, which are limited only by the boundaries of the imaginations of policymakers. Some of the more powerful instruments – constitutional amendments, legislation, and regulation – draw on legal authority. Policies made using legal authorities are often difficult and time-consuming to change. Other authority-based instruments include regulation, self-regulation, advisory committees, and consultations (Deber and Mah 2014). Treasure-based instruments – those that involve spending or raising funds – are also powerful. They tend to last because those receiving the funds usually are reluctant to give them up. Examples include taxation, public spending, grants, and user charges. Two additional categories of instruments are organization-based and information-based (Deber and Mah 2014). The former is a broad category that includes the direct provision of goods and services, as well as government reorganization. The latter category entails collecting and disseminating information through vehicles like commission inquiries, press releases, and advertisements.

Policy can be pursued by any person or group interested in it. *Public policy* is pursued by government. Legislators, judges, and public executives and administrators make and implement public policy with the assistance of interest groups, lobbyists, private and nonprofit organizations, political parties, researchers, the media, and citizens.

### Definition of Health

*Health* is "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity" (International Health Conference 1946). Many factors related to a

person's individual characteristics, behaviors, and physical, social, and economic environments interact to determine health. Specific factors include income; employment; social supports; education; literacy; the physical environment, such as the availability of water, food, and housing; biology; genetics; and health services.

Health can be measured at many levels, including but not limited to individual, family, household, community, demographic group, region, state or province, and nation.

Health problems can be large or small and range broadly from a messy hospital supply room to the current prescription opioid epidemic to dirty drinking water to illiteracy to poor signage at a busy intersection.

## Importance of the Health Sector

Without health, it is difficult to thrive and be happy. As a result, health regularly ranks as a top policy priority for people in the United States and dozens of other nations around the world (Harms 2013; Pew Research Center 2014).

Due to its importance, scope, and complexity, the health sector consumes a large proportion of the gross domestic product (GDP, the value of all goods and services produced) of industrialized nations; in 2013, health spending accounted for 8.9% of GDP on average, including 16.4% in the United States (Organisation for Economic Cooperation and Development [OECD] 2015). Per capita spending averaged almost $3,500 US (OECD 2015). In federal political systems, health spending often consumes the budgets of substates. In 2015, Canada's provinces devoted 38% of their budgets, on average, to health care (Canadian Institute for Health Information 2016). Additionally, in most nations, the health and social (social work) workforce comprises a substantial proportion of all civilian employment, including 13.2% in Ireland and 20% in Norway in 2014 (OECD 2016).

It follows then that health policy occupies a large portion of the policy sphere (Fig. 1).

**Comparative Health Policies, Fig. 1** Health policy's portion of the policy sphere

## Health Systems

The "ensemble of all organizations, institutions and resources...mandated to improve, maintain, and restore health" is a *health system* (World Health Organization Europe 2008).

Health systems operate at many levels – national, subnational, regional, and local – and sometimes congruently. A country's health system may be run centrally by the national government or, particularly in federal political systems, be delegated in whole or in part to substates that further delegate to regional authorities. Or, in both unitary and federal countries, a system may function primarily at the regional or local levels.

Health systems can be thought of as having three main dimensions: financing, service provision, and regulation (Böhm et al. 2013). *Financing* consists of raising money for health insurance (financial protection against health-care costs) and care through mechanisms such as direct taxation, social insurance contributions, or private payment. *Service provision* encompasses delivery location, providers, and technologies. *Regulation* refers to the governance of relationships between financers, providers, and beneficiaries, including how patients access services, what service they can receive (e.g., emergency room visits, physical exams, prescriptions, dental surgery, psychotherapy, and nursing home care), and how financers pay various care providers for them.

State, societal (private nonprofit), or private actors can perform financing, service delivery, and regulatory functions.

Böhm et al. (2013) classified the health systems of 30 OECD countries by the extent to which each type of actor dominated each dimension. Twenty-eight systems fit into four clusters:

- National Health Service = state domination of all dimensions
- National Health Insurance = state financing and regulation with private service provision
- Social Health Insurance = societal financing and regulation with private service provision
- Etatist Social Health Insurance = societal financing, state regulation, and private service provision

The US system did not fit into any of these clusters. Bohm et al. labeled it a uniquely "private" system because private sector actors dominate each of the three dimensions. Due to the predominance of private financing, it is the only health system of the 30 that does not provide universal health-care coverage (Camillo 2016).

### Health System Components

No matter the type, the health systems of industrialized nations contain the following components:

- Patients
- Patient advocates
- Hospitals
- Long-term care institutions
- Hospices
- Clinics
- Pharmacies
- Laboratories
- Morgues
- Medical schools
- Nursing schools
- Physicians, nurses, and providers representing dozens of other health-care professions, including dentistry and occupational therapy
- Alternative providers, such as reflexologists and acupuncturists
- Provider associations
- Emergency and nonemergency medical transportation companies
- Nonprofit and private insurance plans
- Lobbyists
- Research institutes
- Drug and medical device manufacturers and salespeople
- Blood banks
- Information technology systems, including those that pay claims and maintain electronic medical/health records
- Accountants
- Quality reviewers
- Data analysts
- Administrators
- Financers
- A wide range of organizations, public, societal, and private, that make health policy and direct and/or monitor implementation

Despite the expansive definition of health adopted by the World Health Organization (WHO) at the 1946 International Health Conference and subsequent pledges by gatherings of nation states to apply it by addressing the social determinants of health, health systems have largely de-emphasized mental and social health care in favor of biomedical care that relies upon technology to diagnose and restore individuals' physical health. For example, the United States did not require private insurance plans to cover mental health care on equal terms as physical health care until 2010. Relatedly, nations with sizable indigenous populations, like Canada, did not incorporate traditional healing methods into their systems until very recently.

Health systems that embrace the WHO's more expansive "population health" approach might also include traditional healers, school systems, teachers, food banks, grocery stores, social service agencies and providers, environmental engineers, urban planners, bicycle shops, justice officials and correctional institutions, and a range of other public, societal, and private entities that directly or indirectly affect well-being.

### Health Policy Issues

Most health systems in industrialized nations are trying to develop policies to:

- Achieve financial sustainability
- Determine which services to cover
- Ensure timely access to services
- Eliminate unnecessary services and waste
- Coordinate care across providers
- Treat patients with multiple chronic conditions

- Eliminate socioeconomic inequities
- Ensure safe, high-quality, patient-centered care
- Improve accountability
- Enhance patient and provider experiences
- Transition to an upstream approach that emphasizes health promotion from a downstream one that emphasizes treatment
- Prevent illness by addressing the social determinants of health
- Utilize data and information while respecting privacy
- Encourage the development of appropriate and cost-effective innovations

Additional policy adoption or reform efforts could be prompted by factors like demographic changes, such as the aging of the population, new disease outbreaks, and political demands.

## Comparative Health Policy

### Purposes

Comparative health policy entails examining two or more for similarities and differences and evaluating those found. Those who compare policies do so for a range of reasons – negative, neutral, and positive.

The most basic reason is to perform "policy warfare," which Marmor et al. (2009) describe as misrepresentation to win policy debates. For example, in the United States, politicians frequently reference longer wait times for certain health services in Canada to dissuade Americans from supporting the adoption of single-payer (publicly financed) health insurance programs like those run by Canada's provinces.

When done in a methodologically sound manner, comparison facilitates negative learning – the identification of undesirable or unworkable components or characteristics. Randomized, controlled experiments, for instance, can identify prescription drugs that do not cure or ameliorate illness.

Sometimes comparison improves understanding. By comparing one policy to another, we can essentially see the first in relief, meaning we can recognize previously indistinct features. When Canadians compare provincial/territorial health insurance plans, they discover that while they share the same mandate to provide comprehensive care, they differ in significant ways, including in what services they cover. For instance, Prince Edward Island's health system is the only one that does not cover abortions performed in-province, which might reflect previously unknown unique economic and/or cultural circumstances.

Comparative study can help hold health system leaders accountable. The US Medicare program's Nursing Home Compare website encourages the family members of individuals needing a nursing home level of care to compare facilities on a range of quality measures, which incentivizes facility managers to provide excellent care in order to keep beds full.

Comparison generates policy ideas. Policymakers can compare their own facilities, practices, insurance plans, or programs with similar ones to identify what they do differently for the purpose of developing new workable ideas (i.e., for the purpose of positive learning). State Medicaid programs in the United States regularly "borrow" policy ideas from one another in this manner.

Finally, comparison facilitates good policymaking. Government briefing notes, options papers, cabinet decision items, and other such working documents compare policy alternatives on decision-making criteria in order to determine which alternative would best solve the policy problem at issue. Without multiple alternatives to consider, policymakers might adopt insufficient policies simply because they were the only ones presented.

### Comparative Study Forms

Marmor et al. (2009) identified four clusters of comparative health policy work at the national level:

1. Descriptive documents providing statistical data, including some drawn from surveys, about a number of similar countries. Occasionally these documents include rankings.
2. Parallel case studies describing the health systems of multiple nations using a common

template. The WHO European Observatory on Health Systems and Policies in transition series is an exemplar.
3. Books that employ a common framework to explore a particular health policy topic, such as privatization, in a number of individual countries.
4. Cross-national studies with a fundamental theoretical orientation that examine a specific health policy topic or question, sometimes utilizing empirical data.

Comparative work at the subnational and regional/local level falls into the same categories, although it seems to skew even more heavily toward the first two.

Increasingly, comparisons are available online as downloadable papers or in the form of data tables. In the case of the first category, they often come with self-directed comparison tools.

A wide range of users – consumers, members of the media, policy analysts, advocates, practitioners, policymakers, etc. – utilize comparative health policy studies, especially works in the first two categories. The latter two categories are mostly the province of scholars.

Scholars working for academic institutions, think tanks, foundations, or consulting firms produce most of the studies. They might receive input or support from government organizations, but public employees generally do not serve as lead authors.

No single peer-reviewed academic journal is devoted to the comparative study of health policy, although numerous journals focus on health and do publish comparative studies. Canada's *Health Reform Observer – Observatoire des Réformes de Santé* is an open access, peer-reviewed, online journal that aims to facilitate the flow of evidence about health reforms between scholars and decision-makers. One of the four types of articles it invites is comparative health reform analyses.

It is important to note that much comparative health policy analysis is conducted informally or confidentially by practitioners for the purposes of generating or selecting policy alternatives, not for the purposes of informing a wider audience. So, for example, three state health policy leaders might participate on a conference panel to share lessons with their peers on how to finance global budgeting, as was the case at the 2016 National Academy for State Health Policy (NASHP) conference, but might not publish presentations for dissemination to the broader health policy community.

## Comparative Methods

Quantitative, qualitative, and mixed methods are used to compare health policies. The content of policies (such as regulatory text) are compared, as well as inputs, outputs, and outcomes. Inputs consist of the resources – human, financial, physical, and virtual – and processes a policy utilizes. They influence the outputs and outcomes of a policy, although not always positively or directly or in well-understood ways. Outputs are the work and waste generated by a policy. They are typically quantifiable, so they are often measured to evaluate policies, but there is not necessarily a direct relationship between outputs and outcomes. Outcomes are the effects of the policy, or components thereof, on the health of the population or population subgroups. In the case of the expansion of US state Medicaid programs as authorized by the Affordable Care Act, inputs were the resources the states used to expand their programs, outputs included the number of additional individuals enrolled in those programs, and outcomes included changes in insurance rates.

Studies in the first two clusters tend to use description and descriptive statistics. Description could take many forms, like the written experiences of patients with the same disorder who are receiving different therapies or a side-by-side analysis of the components of two pieces of legislation. Descriptive statistics are compiled using primary and secondary administrative and survey data (and, to a lesser extent, clinical data). Recent advances in information technology enable the relatively quick development and administration of surveys. Plus, they make it possible for health systems and statistical agencies, such as the US Census Bureau or Statistics Canada, to share large administrative databases with the public for secondary analysis. Grounded theory – a qualitative approach through which theory is developed from

an iterative analysis of data – and sophisticated statistical techniques, like regression analyses employing multiple independent and dependent variables, are commonly used for the third and fourth categories of comparative policy work. Study methods also vary according to purpose, policy issues, and level of analysis (national, sub-state, local, etc.).

Different disciplines dominate depending upon the policy issue and the country. In the United States, economists have a particularly large presence in the study of health policy.

## Challenges

Comparative health policy study presents a few special challenges above and beyond regular health policy study.

Collecting data from multiple jurisdictions/sites requires more approvals and paperwork. Furthermore, collected data typically needs more standardization because jurisdictions/sites usually develop codes independently.

All data, especially qualitative, require more interpretation because the underlying policy and policymaking contexts differ significantly. To effectively compare policies, one must take into account these differences. Contextual factors describe a policy's setting, effectively outlining what policy or reform is possible. Political scientists argue that institutions (e.g., political systems and government organizations), ideas (to include political ideologies and principles, such as accessibility, sustainability, and comprehensiveness), and interests (stakeholders) shape policy decisions. So do policy legacies (previous policies). In analyzing 63 quantitative comparative health policy studies that used the US States as the unit of analysis, Miller (2005) found 43 policymaking determinants, such as nursing home beds, liberal opinion, and advocacy groups, that consistently predicted policy outcomes. These determinants shape policy at all stages of the complex, nonlinear policymaking process (Fig. 2) and vary significantly from one jurisdiction to another.

Physical distance and differences in language/terminology can hinder study teams' communication unless the teams include representatives from each jurisdiction/site, which is more costly. Yet, due to comparative study's seeming irrelevance to some, financial and other support can be difficult to obtain, especially from public officials who must justify it to taxpayers.

## Findings

After analyzing the comparative study of health policy conducted at the national level over the last three decades of the twentieth century, Marmor

**Comparative Health Policies, Fig. 2** Policymaking process model

et al. (2009) concluded that the field is growing, partly because supply induces demand, but has yet to fulfill its promise, especially in the western world. They blame a disconnect between practitioners and academics, which keeps policymakers from reading the most sound studies (those that fall into their third and fourth categories of comparative literature, as described above).

At the subnational and local levels, scholars in the United States and Canada have largely evaluated the success of comparative study by assessing policy diffusion and the spread of innovation. In summarizing a special issue (2017) of the Journal of Health Politics, Policy, and Law devoted to understanding the diffusion of Affordable Care Act (ACA) policies in the United States, editor Colleen Grogan drew a similar conclusion as Marmor et al. – there is a desire for information about other jurisdictions but its usage is dictated by the political aspects of the policymaking process. Specially, she wrote: "...those who want the reform are busy implementing and learning from similarly reform-minded states, and those who are against reform are busy fighting to stop it and learning from similarly resistant states." Writing around the same time, the editor of one of Canada's leading health policy journals was inspired by evidence that health innovations had scaled and spread in several settings (Zelmer 2015).

## Conclusion

It seems unquestionable that comparative health policy study will continue to grow as the health sector of most economies expands and technological advances improve information dissemination.

Suggested next steps for the field are to accept that politics within all health-related organizations – public, societal, and private – limit the application of learning; to focus on understanding and documenting how policymakers and policy implementers gather and use comparative information in order to enhance their effectiveness; and to improve communication between comparative health policy analysts/researchers and policymakers/implementers.

# Comparative Healthcare Systems

Cheryl A. Camillo
Johnson-Shoyama Graduate School of Public Policy, University of Regina Campus, Regina, SK, Canada

## Synonyms

Comparative healthcare delivery systems; Comparative health financing systems; Comparative health systems; Health system analysis

## Definition

The comparison of two or more healthcare systems operating within broadly similar jurisdictions using qualitative and/or quantitative methods for the purposes of deepening understanding, clarifying differences, identifying possible reforms, and/or accomplishing political objectives.

## Introduction

Health systems – the ensemble of all organizations, institutions, and resources, set within the political and institutional framework of a jurisdiction and mandated to improve, maintain, and restore health (World Health Organization Europe 2008) – are of great interest to the public, policymakers, and public administrators at all levels at which they operate (national, subnational, and local) because they have considerable impact on individual and population health and the economy. Due to their significant variation, scholars, practitioners, and politicians frequently compare them, or their component parts, for purposes ranging from classification to identifying reform possibilities to scoring political points.

This chapter describes health systems, summarizes their comparative study, discusses its effectiveness, and suggests a new approach.

## Health Systems

### Health Definition

According to the World Health Organization (International Health Conference 1946), health is "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity." Many factors related to a person's individual characteristics and behaviors and physical, social, and economic environments combine to determine health. Specific factors include: income; employment; social supports; education; literacy; the physical environment, such as the availability of water, food, and housing; biology; genetics; and health services.

### Health System Dimensions

Health systems have three main dimensions: financing, service provision, and regulation (Böhm et al. 2013). Financing consists of raising money for health insurance and care through mechanisms such as direct taxation, social insurance contributions, or private payment. Service provision encompasses their delivery location, providers, and technologies. Regulation refers to the governance of relationships between financers, providers, and beneficiaries, including how patients access services, what service they can receive (e.g., emergency room visits, physical exams, prescriptions, dental surgery, psychotherapy, and nursing home care), and how financers pay various care providers for them. State, societal (private non-profit), or private actors can perform financing, service delivery, and regulatory functions.

### Levels of Health Systems

Health systems operate at many levels – national, subnational, regional, and local – sometimes

congruently. A country's health system may be run centrally by the national government or, particularly in federal political systems, be delegated in whole or in part to substates who further delegate to regional authorities. Or, in both unitary and federal countries, a system may function primarily at the regional or local levels.

### Health System Types

Bohm et al. (2013) classified the health systems of 30 Organisation for Economic Co-operation and Development (OECD) countries by the extent to which each type of actor dominated each dimension. They determined that 28 of them fit into four clusters:

- National Health Service = State domination of all dimensions
- National Health Insurance = State financing and regulation with private service provision
- Social Health Insurance = Societal financing and regulation with private service provision
- Etatist Social Health Insurance = Societal financing, state regulation, and private service provision

England, where the National Health Service (NHS) employs 1.5 million people, is the model for the first "command and control" type (Government of the United Kingdom 2015). Canada, where most physicians contract privately with provincial/territorial health systems that operate under five principles stipulated by the federal Canada Health Act, including "public administration," is a strong example of the National Health Insurance type. Germany, where the majority of citizens contribute to self-governing "sickness funds" through payroll taxes, is the prototype for Social Health Insurance (SHI) systems. Etatist Social Health Insurance systems, which function like SHI systems with more state regulation, cluster near Germany in Central and Eastern Europe.

The US health system is uniquely "private" because private sector actors dominate each of the three dimensions. In fact, due to the predominance of private financing, the USA is the only one of the 30 countries that does not provide universal healthcare coverage (Camillo 2016).

### Development of Health Systems

Most modern health systems in industrialized Western nations began to develop in the late nineteenth century when progressive social reformers, trade unions, and health professionals with new understandings of epidemiology pushed to improve living conditions in increasingly populated urban areas. In 1883, German Chancellor Otto von Bismarck implemented Europe's first compulsory Social Health Insurance system (which is commonly known as Bismarck systems). Health insurance and hospital systems continued to develop through World War II, after which Sir William Beveridge recommended that the UK adopt the NHS (often called the Beveridge Model) as part of a package of reforms to promote social welfare and economic growth after the Great Depression and war. Canada and the USA established the framework of their systems in the mid-1960s after considerable debate concerning the role of medical professionals. Several non-Western nations with significant economies, such as India, developed their health systems along a similar timeline, particularly after World War II.

Demographic changes, like the aging of the population of certain countries, new disease outbreaks, treatment advances, innovations in medical technology and information processing, and political demands prompt new reforms. For example, between 2003 and 2010, the USA adds prescription drug coverage to its national social health insurance program for elderly and disabled individuals (Medicare), expanded its federal-state public health insurance program (Medicaid) for low-income individuals, and instituted federal subsidies for the purchase of private coverage by otherwise uninsured middle-income persons.

Despite the WHO's expansive definition of health, the aforementioned systems pursued a biomedical approach to care that emphasized the restoration of individuals' physical health. For instance, the USA did not require mental health parity in private insurance coverage until 2010. In Canada, access to psychotherapy is limited (Marchildon 2013). Additionally, nations with sizable indigenous populations, like Canada, did not incorporate traditional healing methods into

their systems. Only recently have some acknowledged the value of doing so.

In 1974, Canada's Minister of National Health and Welfare Marc Lalonde introduced the concept of "population health," "an approach to health that aims to improve the health of the entire population and to reduce health inequities among population groups. . ..it looks at and acts upon the broad range of factors and conditions that have a strong influence on our health." (Health Canada 2012). The approach was soon embraced in principle by health system leaders; however, while multiple gatherings of nation-states, such as the 2011 World Conference on Social Determinants of Health, have subsequently adopted charters pledging to promote it by addressing factors and conditions (i.e., social determinants) such as poverty and poor housing, implementation has lagged. Government organizations remain siloed and programs unintegrated – typically, separate health, social service, housing, and education agencies do not coordinate in delivering services to clients. Most resources are spent on restoration of individual health. In 2014, 29.5% of Canadian health expenditures went to hospitals, whereas only 5.6% went to public health (Canadian Institute for Health Information 2016).

Generally, so-called Third World nations have prioritized building public health infrastructure over an insurance system meaning that they have focused on surveillance, health promotion, prevention, infectious disease control, environmental protection and sanitation, and disaster preparedness and response.

### Health System Components

No matter the type, modern OECD health systems have the following components: patients; patient advocates; hospitals; long-term care institutions; hospices; clinics; pharmacies; laboratories; morgues; medical schools; nursing schools; physicians, nurses, and providers representing dozens of other healthcare professions, including dentistry and occupational therapy; alternative providers, such as reflexologists and acupuncturists; provider associations; emergency and non-emergency medical transportation companies; nonprofit and private insurance plans; lobbyists; research institutes; drug and medical device manufacturers and salespeople; blood banks; information technology systems, including those that pay claims and maintain electronic medical/health records; accountants; quality reviewers; data analysts; administrators; financers; and a wide range of organizations, public, societal, and private, that make health policy and direct and/or monitor implementation.

Health systems that embrace a population health approach might also include school systems, teachers, food banks, grocery stores, social service agencies and providers, environmental engineers, urban planners, bicycle shops, justice officials, correctional institutions, and many other public, societal, and private entities that directly or indirectly affect well-being.

### Health System Importance

Health systems have great economic impact. They consume a large proportion of the gross domestic product (GDP, the value of all goods and services produced) of OECD nations – in 2013, health spending accounted for 8.9% of GDP on average, including 16.4% in the USA (OECD 2015). Per capita spending averaged almost $3,500 (OECD 2015). Additionally, in most nations the health and social (social work) workforce comprises a substantial proportion of all civilian employment, including 13.2% in Ireland and 20% in Norway in 2014 (OECD 2016).

## Comparing Health Systems

### Purposes

Comparing health systems entails examining two or more for similarities and differences and evaluating any found. Those who compare systems do so for a range of reasons – negative, neutral, and positive.

The most basic reason is to perform "policy warfare," which Marmor et al. (2009) describe as misrepresentation to win policy debates. In the USA policymakers often dub the British healthcare system "government medicine" or "socialized medicine" to dissuade Americans, who generally prefer less government, from supporting a single-payer (public financing) approach.

Sometimes comparison improves understanding. By comparing one system to another, we can essentially see the first in relief, meaning we can recognize previously indistinct features. When Canadians compare provincial and territorial health insurance programs, they discover that they differ significantly in their coverage of certain populations or services, like abortion, which might reflect little understood regional economic and cultural differences.

Classifying systems, as Bohm et al. (2013) did, help to identify dimensions and variables that researchers can study and policymakers can consider when constructing or reforming systems. Classification also aids in identifying patterns that illuminate what may or may not be possible. For example, regional clustering of national health systems by type, such as National Health Service systems in Nordic countries, suggests that the underlying culture might determine what system a country adopts.

Comparing systems on their performance is a means of holding them accountable. Health leaders do not want their systems to perform worse on standard measures than other systems. It also facilitates negative learning – the identification of undesirable or unworkable components or characteristics.

Relatedly, comparing systems generates ideas for transplantation by policymakers and system leaders.

## Levels of Comparison

Facilitated by cultures of learning, convening organizations and data, health system comparisons are made at all levels.

At the national level, the WHO, the OECD, and the Commonwealth Fund, a private foundation based in New York City that promotes high-performing healthcare systems, are three notable organizations that collect and publish comparative data. The WHO maintains the Global Health Observatory, a publicly available database with interactive visualizations of more than 1,000 indicators from almost 200 countries. Similarly, the OECD maintains a comprehensive online database of health statistics to foster comparative analyses. The Commonwealth Fund conducts annual cross-national surveys to capture physicians' and patients' perceptions of system performance. These, and other, organizations regularly convene symposiums and other forums to facilitate learning.

While not as prominent, in federal states with multilevel health systems, such as Canada and the USA, political leaders, policymakers, and/or health system managers have formed associations like Canada's Premiers' Health Care Innovation Working Group and the National Academy for State Health Policy to enhance capacity through the exchange of experiences and ideas and the provision of technical assistance. On a daily basis, much sharing takes place across provinces and states through informal networks formed at association events for the purposes of developing health system reforms.

Comparative work is also done at the local level. The US-based Robert Wood Johnson Foundation (2017) annually publishes county health rankings "to provide a starting point for change in communities." This work is often very practical in nature. The Institute for Healthcare Improvement (IHI) has formed collaboratives of health systems, public health departments, and provider groups to assist them in planning and implementing comprehensive care designs to serve patients with complex needs.

## Variables for Comparison

Health systems can be compared on contextual factors, inputs, outputs, and outcomes. Contextual factors describe a system's setting, effectively outlining the type of system and the reforms that are possible. Political scientists argue that institutions (e.g., political systems and government organizations), ideas (to include political ideologies and principles, such as accessibility, sustainability, and comprehensiveness), and interests (stakeholders) shape policy decisions. So do policy legacies (previous policies).

Inputs consist of the resources – human, financial, physical, and virtual – invested in a system by organizations and individuals. The processes a system uses are inputs. They are of particular interest to policymakers, health system leaders, and financers (taxpayer and private payer alike)

because of their magnitude, as previously discussed. Inputs influence the outputs and outcomes of the system, although not always positively or directly or in well-understood ways.

Outputs are the work and waste produced by a system. Given their complexity, health systems generate a vast range of outputs from dollars spent to surgeries performed to syringes discarded to medical record entries made. To patients, they represent goods and services received. They are typically quantifiable, so they are often measured to evaluate systems, although there is not necessarily a direct relationship between outputs and outcomes.

Outcomes are the effects of the system, or components thereof, on the health of the population or population subgroups. Examples include infant mortality, life expectancy, and happiness.

## Comparative Methods and Study Forms

Quantitative, qualitative, and mixed methods are used to compare health systems.

Marmor et al. (2009) identified four categories of comparative health literature at the national level:

1. Descriptive documents providing statistical data, including some drawn from surveys, about a number of similar countries. Occasionally these documents include rankings.
2. Parallel case studies describing the health systems of multiple nations using a common template. The WHO European Observatory's Health in Transition series is an exemplar.
3. Books that employ a common framework to explore a particular health topic, such as privatization, in a number of individual countries.
4. Cross-national studies with a fundamental theoretical orientation that examine a specific health topic or question, sometimes utilizing empirical data.

Grounded theory and sophisticated regression techniques are commonly used in the third and fourth categories.

Comparative literature at the subnational and regional/local level falls into the same categories, although it seems to skew even more heavily toward the first two.

No single peer-reviewed academic journal is devoted to the comparative study of health systems, although numerous journals focus on health and publish special issues featuring comparative research.

It is important to note that much comparative health system analysis is conducted informally by practitioners for the purposes of applying lessons in the near future, not for contributing to the literature. For example, when considering system reforms, state health analysts frequently reach out to colleagues in other states to gather information about their experiences with similar reforms. They rarely publish these analyses.

## Challenges

Comparative health system study presents a few special challenges above and beyond regular health system study. Collecting data from multiple jurisdictions/sites requires more approvals and paperwork. Collected data typically needs more standardization because jurisdictions/sites usually develop codes independently. All data, especially qualitative, require more interpretation because underlying contexts differ significantly. Physical distance and differences in language/terminology (even health systems in neighboring US states use starkly different terminology) can hinder communication unless study teams include representatives from each jurisdiction/site, which is more costly. Yet, due to comparative study's seeming irrelevance, financial and other support can be difficult to obtain, especially from public officials who must justify it to taxpayers.

## Findings

After analyzing the comparative study of health policy conducted at the national level over the last three decades of the twentieth century, Marmor et al. (2009) concluded that the field is growing, partly because supply induces demand, but has yet to fulfill its promise, especially in the Western world. They blame a disconnect between practitioners and academics,

which keeps policymakers from reading the most sound studies (those that fall into their third and fourth categories of comparative literature, as described above).

At the subnational and local levels, scholars in the USA and Canada have largely evaluated the success of comparative study by assessing policy diffusion and the spread of innovation. In summarizing a special issue (2017) of the *Journal of Health Politics, Policy, and Law* devoted to understanding the diffusion of Affordable Care Act (ACA) policies in the USA, editor Colleen Grogan drew a similar conclusion as Marmor et al. – there is a desire for information about other jurisdictions but its usage is dictated by the political aspects of the policymaking process. Specially, she wrote: "...those who want the reform are busy implementing and learning from similarly reform-minded states, and those who are against reform are busy fighting to stop it and learning from similarly resistant states." Writing around the same time, the editor of one of Canada's leading health policy journals was inspired by evidence that health innovations had scaled and spread in several settings (Zelmer 2015).

## Conclusion

It seems unquestionable that comparative health system study will continue to grow as the health sector of most economies expands and technological advances improve information dissemination.

Suggested next steps for the field of study are to accept that politics within all health organizations – public, societal, and privat – limit the application of learning and to focus on documenting how practitioners gather and use comparative information in order to enhance their effectiveness. In addition, comparative health system scholars can identify the lessons learned by First World countries as they developed their health systems about how to efficiently promote, maintain, and restore health and share those with nations that are beginning to develop their systems.

# Comparative Historical Analysis, A Methodological Perspective

Frank L. K. Ohemeng
Department of Political Science, Concordia University, Montreal, QC, Canada

## Synonyms

Approximate; Comparable; Equivalent; Provisional

## Definitions

Comparative historical analysis is concerned with causal analysis, an emphasis on processes over time, and the use of systematic and contextualized comparison (Mahoney and Rueschemeyer 2003a).

Comparative historical analysis is a field of research characterized by the use of systematic comparison and the analysis of processes over time to explain large-scale outcomes such as revolutions, political regimes, and welfare states. It can be distinguished from other approaches within historical sociology, such as rational choice analysis and interpretive analysis (Mahoney and Rueschemeyer 2003a).

## Introduction

Among ways of understanding social issues, one that has best stood the test of time is comparative historical analysis (CHA) (Lange 2013; Mahoney and Rueschemeyer 2003a; Mahoney and Terrie 2008). Although it has been around as long as anyone can remember, it is, as a number of scholars have noted, only in the past 30 or so years that it has received much attention, to go by the numbers of books and journal articles that have been published in this period. Furthermore, CHA is now use in many disciplines in the social sciences, including politics, sociology, economics, public administration and management, and public policy (Acemoglu et al. 2001; Barzelay and Gallego 2010; Lange 2013; Thelen and Mahoney 2015). Comparative historical analysis, according to Collier (1998), deals with "a sustained focus on a well-defined set of national cases, a concern with a substantial time frame and with the unfolding of causal processes over time and the use of systematic comparison to generate and/or evaluate explanations of outcomes at the level of national politics" (1–2).

## Distinctive Features of Comparative Historical Analysis

Mahoney and Rueschemeyer (2003b) have identified three main features of CHA. First is that it is concerned with explanation and identification of causal configurations that produce major outcomes of interest (11). From this perspective, CHA scholars "consider how multiple factors combine to form coherent larger combinations, complexes, and causal packages" (Thelen and Mahoney 2015: 7). Thelen and Mahoney (2015) explain why CHA scholars are interested in causal configuration by noting they "value causal complexity for its own sake or underappreciate parsimony" (8).

Second, CHA is concerned with historical sequences and the processes of history unfolding over time (12). This procession of sequences has led many scholars to argue that CHA is about process tracing, a methodological phenomenon that involves "attempts to identify the intervening causal process—the causal chain and causal mechanism—between an independent variable (or variables) and the outcome of the dependent variable" (George and Bennett 2005: 206–207), or "as the systematic examination of diagnostic evidence selected and analyzed in light of research questions and hypotheses posed by the investigator" (Collier 2011: 823). In using this approach, CHA scholars focus on (1) defining their theoretical expectations, (2) giving direction to their research, and (3) identifying the types of data necessary for testing a theory (Risks and Liu 2018: 842).

Third, scholars of comparative historical analysis engage in systematic and contextualized comparison of similar and contrasting cases (13). Thus, according to Mahoney (2015), CHA is an example of case-based research. The foundational and philosophical method of research involves considering one or two cases, and then building a theory about them or an explanation for them. The aim of CHA is thus to find comprehensive explanations of outcomes in specific cases. It particularly emphasizes well-crafted concepts and valid measurement; it encompasses tools with which one can search for necessary and sufficient conditions (of the deterministic and probabilistic sort); and it involves a focus on temporality, which includes, among other things, sequencing and path dependence.

## How Comparative Historical Analysis Is Undertaken

One of the main issues underlying CHA is the question of how a phenomenon can be studied. According to Ritter (2014), "CHA is one of the social sciences' oldest methods," (98) and its practitioners have a number of methodological imperatives. Irrespective of the focus of the study, three core traits – concern with the explanatory goal, the conception of causation, and the method of theory testing (Mahoney and Terrie 2008) – are fundamental to CHA.

First is the comparative method, using in-case analysis. According to Lijphart (1971), "the comparative method is here defined as one of the basic methods – the others being the experimental, statistical and case study methods – of establishing general empirical propositions. . . .Second, the comparative method is here defined as one of the basic scientific methods," and "third, the comparative method is here regarded as a method of discovering empirical relationships among variables" (682–683). The comparative method "involves the nonstatistical comparative analysis of a small number of cases" (George and Bennet 2005: 151).

It is an interest in contextuality that causes CHA scholars to use the comparative method, which is to say they are context specific, since such context helps in understanding the different cases. It enables them to draw a map that shows the whole process they are trying to explain. This in turn helps them identify and isolate variables, as well as develop what they have described as a causal mechanism in a process they call "process tracing" (George and Bennet 2005; Mahoney 2003), which is an "analytic procedure for systematically evaluating pieces of (usually) qualitative evidence to explain an outcome of interest" (Zaks 2016: 452). With this approach, CHA scholars look "at evidence within an individual case, or a temporally and spatially bound instance of a specified phenomenon, to derive and/or test alternative explanations of that case. In other words, process tracing seeks a historical explanation of an individual case, and this explanation may or may not provide a theoretical explanation relevant to the wider phenomenon of which the case is an instance" (Bennett 2008).

Unlike some analyses, moreover, such as rational choice, that insist on methodological individualism (Lange 2013) (which simply "means that one starts from the individual in order to describe certain economic relationships" (Schumpter 1908, cited in Hodgson 2007)), CHA scholars' position reflects both pragmatic considerations and a particular ontological commitment. In short, CHA is interested in aligning ontological and methodological approaches to "better explain outcomes, explore contexts, and assess causes that unfold over long stretches of time" (Skocpol 2003: 419).

A third methodological imperative of CHA is to use "a finite set of cases, chosen against a backdrop of theoretical interest, and aim to determine the causal sequences of patterns of producing outcomes of interest in those specific cases" (Goldstone 2003: 43). In short, scholars employing CHA do not focus on a large number of cases, but are rather interested in what methodology scholars have described as small N (Lange 2013; Rueschemeyer 2003), which is a study ". . .in which a large number of observations are made on a relatively small number of experimental participants" (Smith and Little 2018). It must, however, be said that focusing on small N does

not mean that CHA scholars are not interested in large N. Most of these scholars take the result of large N cases as their point of departure. In short, large N forms their basis of study. In CHA the interest is in one or two or, at most, just a few cases (Lange 2013). Large N deals with a large number of cases and prefers multiple observations (Paul et al. 2013). While some scholars have criticized the use of small N in research, especially when it comes to generalization, Goldstone (2003) says that while "generalization is certainly a goal (of CHA),. . .generalization is sought by piecing together a finite set of cases, not by sampling and inference to a larger universe" (43). In a nutshell, "CHA findings are often derived from the analysis of a small number of cases, but they frequently can be accumulated so that they add up to fairly broad generalizations" (Mahoney 2015: 78). Lange (2013) is of the view that CHA scholars use small-N comparisons because they are easily combined with within-case analysis, which is the in-depth exploration of a single case as a stand-alone entity. Within-case analysis, therefore, "involves an intimate familiarity with a particular case in order to discern how the processes or patterns that are revealed in that case support, refute, or expand (a) a theory that the researcher has selected or (b) the propositions that the researcher has derived from a review of the literature and/or experience with the phenomenon under study" (Paterson 2010: 970–971).

An essential factor in this methodological imperative, according Collier (1998), is that while most CHA scholars use a small-N framework, they are now employing varying mixes of qualitative and quantitative data, with increasing use of the latter as better quantitative data sets have become available. As a result, CHA is able to make generalizations, but based on a detailed study of a small number of cases.

## The Relevance of Comparative Historical Analysis

Scholars continue to debate the importance of CHA in social research. Its value has not diminished but, rather, continues to influence how research is conducted, and significant advances have been made in application (Jaramillo 2020). Thus, it is believed by "viewing cases and processes at a less abstract level, CHAs are frequently able to derive lessons from past experiences that speak to the concerns of the present" (Mahoney and Rueschemeyer 2003b: 9).

Another important benefit of CHA is knowledge accumulation (Goldstone 2003; Mahoney 2004). Knowledge accumulation is defined as "progress in understanding and learning . . . accumulation occurs when the generation of new knowledge is dependent on previously obtained knowledge" (Mahoney 2003). From this perspective, and focusing on the study of revolutions in the world, Goldstone (2003) is of the view that CHA studies have shown, for instance, that "there is no single set of necessary significant causes that lie behind revolutions. Rather, revolutions are the result of a conjuncture of distinct causal streams, and the type and development of a revolution depend on the precise combination and components of those causal streams" (80–81).

This idea of knowledge accumulation through conjuncture of distinct causal streams is not only applicable in the study of revolution; it can also be used as a framework to understand issues pertaining to public policy, management, development, and governance in general (Barzelay and Gallego 2010; Mahoney 2015). For instance, it was called upon by Barzelay and Gallego (2010) to analyze the cycles of changes in public management in France, Italy, and Spain. They cogently argued that "the politics of public management reform remain opaque unless the features of policy subsystems are analyzed and incorporated into historical and generalizing research arguments" (298). Such an historical approach thus yields the knowledge necessary to understand how different administrative reforms have played out in different countries despite their adoption of similar reform strategies, such as the New Public Management: conditions in different political and governmental systems affect the politics of public management reform differently and, as those conditions are assimilated into the construct of administrative tradition, correspondingly affect the politics of public management reform (301).

Similarly, Mahoney (2015) has outlined what he describes as the advantage of comparative historical research in macro-development. He explained that case-based research is vital to development studies, for example, because such a focus yields both theoretical insights, as well as learning about different facets of cases, which "can stimulate broader research agendas that are taken up by scholars of diverse methodological orientations" (78). He concludes that by "focusing on specific cases, CHA research is problem driven in the sense that it is animated by real-world questions" (79). In all, CHA helps in the development of theories that can be utilized in the study of different phenomena.

The macrolevel of comparative historical analysis also helps scholars account for change and continuity across national party systems. As has already been explained, by focusing on a small number of cases scholars are able to examine them in depth, and dissect explanatory variables and causal inferences (Collier and Collier 1991). Scholars of CHA can identify the starting points of important change through events. This has been called the critical juncture perspective, a critical juncture being "a period of significant change, which typically occurs in distinct ways in different countries (or in other units of analysis) and which is hypothesized to produce distinct legacies" (Collier and Collier 1991). Boas (2017) says that identifying such a critical juncture constitutes a causal hypothesis, which links a major societal transformation to a temporally distant dependent variable that represents the culmination of a process of change, not merely something that happened along the way (18).

A significant contribution made by comparative historical analysis scholars, according to Skocpol (2003), is that CHA research "has successfully developed valid generalizations about many phenomena of great importance without ignoring contextual particularities. What is more, culture and ideology can themselves be analyzed causally, not just assessed for their meaning" (414). Such successful generalization continues to help scholars from different disciplines to study and understand different phenomena in different countries. For example, scholars of public policy and management have come to grips with their subjects by noting the importance of context at the macrolevel. This has enabled them to explain policy development and change in such countries (Amenta 2003; Barzelay and Gallego 2010; Castles 1989).

## Conclusion

Comparative historical analysis has become an important vehicle for studying social issues. Its ability to engage in the in-depth study of the history of a small number of cases, the ability to develop theories to explain different phenomena, and its methodological rigor have made it an attractive scholarly tool. While CHA has had a long intellectual history, as explained by Mahoney and Rueschemeyer (2003a), since its reemergence, it has shown few signs of losing momentum. In other words, the interest in using history to study single countries with a deep focus on context has led to what Pepinsky (2019) has described as "the return of the single country study." In short, CHA has helped to demonstrate that focusing on small *N* studies can yield both theoretical insight and theoretical generalizability. One is bound to accept Offen's (1988) long held view that the "comparative historical approach forces us to broaden our perspective by examining carefully from a different, although not wholly unfamiliar, angle much that we take for granted, namely, the political, social, and economic context in which so many of our own ideas originated. Thus, it allows us not only to recover and dissect the prevailing and dissenting views on the organization of societies, which are embedded historically in the Western debate . . ., but also to explore the political dynamics of the interaction between [*different*] views" (112).

## Comparative Hypotheses for Technology Analysis

Mario Coccia
CNR – National Research Council of Italy, Torino, Italy
Yale University, New Haven, CT, USA

### Synonyms

Nature of technology; Technology; Technological innovation; Technological evolution;

Technological change; Technological progress; Technological advances

## Definition

Hypothesis refers to a supposition put forward in a provisional manner and in need of further epistemic and empirical support. Technology analysis explains the relationships underlying the source, evolution, and diffusion of technology for technological, economic and social change. Technology analysis considers technology as a complex system that evolves with incremental and radical innovations to satisfy needs, achieve goals, and/or solve problems of adopters to take advantage of important opportunities or to cope with consequential environmental threats.

## Introduction

Technology has an important role for competitive advantage of firms and nations, for industrial and economic change in society (Arthur 2009; Hosler 1994; Sahal 1981). *Technology* can be defined as a complex system, composed of more than one entity or subsystem and a relationship that holds between each entity and at least one other entity in the system (Coccia 2019a, b, d). Technology satisfies needs, and sustains the achievement of goals, and solution of problems of adopters to take advantage of important opportunities or to cope with consequential environmental threats (Coccia 2019a, b). Technology is driven by *inventions* of new things and new ways of doing things that are transformed into usable *innovations* in markets for supporting adaptation and/or survival of adopters in highly differentiated and volatile environments (Coccia 2018b, 2019b, c). Technology generates technological, economic and social change by (Coccia 2005b, 2006b, 2016a) *incremental innovations* (progressive modifications of existing products and/or processes), *radical innovations* (drastic changes of existing products/processes, or creation of new products/processes to satisfy needs or solve problems in society), *technological systems* (clusters of innovations that are technically and economically interrelated, e.g., nanotechnology; cf., Coccia and Wang 2015), and *technological revolutions* (pervasive changes in technology affecting many branches of the economy, such as general purpose technologies of information and communication technologies having a technological dynamism and a pervasive use in a wide range of sectors; cf., Coccia 2015a, 2017a, b, 2020).

Technology analysis can be based on "multiple working hypotheses" (Chamberlin 1897) to explain the relationships underlying the source, evolution, and diffusion of technologies and provide theoretical, empirical, and policy implications. The method of multiple working hypotheses (in short, MWHs) involves the development, prior to research, of several hypotheses that might explain the relationships of specific phenomenon, which is likely due to several causes, not just one (Chamberlin 1897). All suggested hypotheses are considered for scientific investigation, including the possibility that none of them are correct and that some new explanations may emerge (Coccia and Benati 2018; Heidelberger and Schiemann 2009).

MWHs for technology analysis can be schematically synthetized as follows (Fig. 1):

- *Traditional MWHs* are demand of technology, induced innovation, learning processes, specialization via scale, disadvantage of beginning, path-dependent processes, competitive substitution, and predator-prey relationships between technologies.
- *New MWHs* are based on multimode relationships between technologies, such as the hypothesis of killer technologies and technological parasitism.

## Multiple Working Hypotheses for Technological Analyses

Traditional and new hypotheses for technology analysis provide a method of inquiry to explain *how* technology originates and evolves in industrial dynamics to generate technical progress in society (cf., Fig. 1).

**Comparative Hypotheses for Technology Analysis, Fig. 1** Multiple working hypotheses (MWHs) for technological analyses

## Traditional Multiple Working Hypotheses for Technology Analysis

### Hypothesis of Demand for Technology

This hypothesis suggests that the innovative output of an industry varies in a direct relation to the volume of its sales. Schmookler and Brownlee (1962) argue that the relationship between technological innovation and demand is postulated to hold in long and short run. The demand-pull hypothesis has received convincing evidence with the work by Griliches (1957) that in the study of the invention and diffusion of hybrid maize demonstrates the role of demand in determining the timing and location of invention and innovation. Schmookler (1962, 1966), using patent statistics of inventions in different industries (e.g., railroads, agricultural equipment, paper, and petroleum), shows that the demand is more important in stimulating inventive activity than advances in the state of knowledge.

A simple model to analyze the hypothesis of demand for technology, considering for instance, farm tractor technology, is given by:

$$\log\ Y_t = a + \beta_1 \log X^{\#}_t + \beta_2 \log\ Y_{t-1}$$

Y is a measure of technical efficiency; $X^{\#}$ is gross investment in tractors, e.g., the number of tractors sold each year (in hundreds). Method of ordinary least squares can be applied for estimating the unknown parameters of relationship just mentioned.

### Induced-Innovation Hypothesis

Hicks (1932, pp. 124–125) argues that "a change in the relative prices of factors of production is itself a spur to innovation and to inventions of a particular kind directed at economizing the use of a factor which has become relatively expensive." The microeconomic version of induced innovation was advanced by Ahmad (1966) and elaborated by Binswanger (1974). In the 1970s and 1980s, theoretical and empirical studies by agricultural economists explain source and evolution of technology with induced-innovation hypothesis (Hayami and Ruttan 1970; Binswanger and Ruttan 1978). Olmstead and Rhode (1993, p. 102) argue that Hayami and Ruttan's induced-innovation hypothesis reveals two distinct variants. The first is *change variant*, associated with the argument by Hicks (1932): a rise in the relative price in one factor leads to technological innovations sparing that factor. The second is *level variant* that even at constant relative factor price levels, new technologies are developed and adopted to save relatively expensive factors (cf., Coccia 2016b).

### Learning by Doing Hypothesis

This hypothesis suggests that technical progress depends on acquisition of practical experience for the solution of consequential problems, such as for treating mutant cancers (cf., Coccia 2015b, 2016a, c, 2017b, 2020). In particular, learning by doing hypothesis argues that the evolution of technology is governed by a process of cumulative change, rather than by a set of replicative events at work (Coccia 2014b, 2016a). The operationalization of this hypothesis requires a measure of experience, such as cumulated production quantities or cumulated years of production (cf., Sahal 1981, p. 112). A relationship, which investigates the learning by doing hypothesis of technological innovation, is given by:

$$\log Y_t = a + \beta_1 \log X_t + \beta_2 \log Y_{t-1}$$

Y is a measure of technical efficiency; X is cumulated production quantities.

### Learning *Via* Diffusion Hypothesis of Technology

This perspective suggests that the increased adoption of a technology paves the way for improvements of its characteristics. In this context, the relevant variable of innovation is the cumulated utilization of technology (i.e., capital stock) rather than cumulated production volume. For instance, the successful development of transport technology depends on how well it dovetails with the larger system of its use and improvements in communications network (cf., Sahal 1981, p. 117).

A relationship that analyzes the learning *via* diffusion hypothesis of technological innovation is given by:

$$\log Y_t = a + \beta_1 \log X^*_t + \beta_2 \log Y_{t-1}$$

Y is a measure of technical efficiency; X* is the stock of technology.

### Disadvantage of Beginning Hypothesis of Technology

Vital factors of the hypothesis of disadvantage of beginning can be resistance to change, the effect of sunk costs (costs that have been incurrent and cannot be recovered), a new technology that cannot conform to specification of existing plant, infrastructure and/or equipment, etc. (Frankel 1955; Sahal 1981, p. 115). This hypothesis can imply that the younger the age of capital stock, the better are the prospects for technical progress: technological innovation can be limited as capital stock grows and becomes older. The age variable (i.e., oldness) can be measured as a ratio of capital stock to gross investment. A relationship, based on this hypothesis in the case study of farm tractor technology, is given by:

$$\log Y_t = a + \beta_1 \log X''_t + \beta_2 \log Y_{t-1}$$

Y is a measure of technical efficiency; X″ is the ratio of the number of tractors on farms to the number of tractors sold.

### Specialization *Via* Scale Hypothesis of Technology

Technology depends on scale of its utilization, which is associated with factors of the physical nature of technology itself. For instance, technological advances in electricity generation have been made possible by an increase in the scale of electricity transmission network: the reason is that capacity increases with the square of the voltage (Meeks 1972, p. 74). According to this hypothesis, variations of scale affect the course of innovative activity. This approach considers the relevance of scale to innovation processes that is based on systemic nature of technological progress (Sahal 1981, p. 119). A basic variable here is the scale of input utilization. A relationship to analyze this hypothesis in the case study of farm tractor is given by:

$$\log Y_t = a + \beta_1 \log X'_t + \beta_2 \log Y_{t-1}$$

Y is a measure of technical efficiency; X′ is the average acreage per farm, which is a main indicator of the scale of input utilization.

### Path Dependence Hypothesis of Technology

The concept of *path dependence of technological innovation* was advanced by Arthur (1989, 1994). David (1985, 1993) provides evidence of the path-dependence perspective with historical studies (such as in QWERTY typewriter keyboard, etc.) and shows how lock-in effects can induce the

persistence of inefficient structure of keyboard (i.e., adopters of this technology depend on a vendor for products/processes and services or previous technologies, unable to use another vendor or technology without substantial switching costsand barriers). The path-dependence model is due to a sequence of historical events and choices of techniques that may influence the future pathways of technology. However, the concept of technology lock-in for path dependence seems to work only for network of information and communication technologies characterized by increasing returns to scale. Instead, industries with constant or decreasing returns to scale, lock-in effect does not work. In short, this perspective suggests that technical change is a path-dependent process: it evolves from earlier technological trajectories.

### Hypothesis of the Competitive Substitution of Technology

Fisher and Pry (1971, p. 75) show that technological evolution consists of substituting a new technology for old one, such as the substitution of coal for wood, hydrocarbons for coal, etc. Fisher and Pry (1971) model the evolution of a new product or process (emerging technology) that substitutes for a prior one (mature technology) in the form of $f/(1\text{-}f)$ as a function of time on semilog paper ($f$ is the market share of the emerging product or process versus time).

### Predator-Prey Hypothesis

Technologies can generate a predator-prey relationship: one technology enhances the growth rate of the other, but the second inhibits the growth rate of the first (Pistorius and Utterback 1997, p. 74). In fact, a predator-prey relationship can exist between an emerging technology and a mature technology, in particular when emerging technology enters into a niche market of mature technology, reducing market share of established technology. Farrell (1993) used Lotka-Volterra equations to examine a predator-prey relationship between technologies, such as nylon versus rayon tire cords, telephone versus telegraph usage, etc. Overall, then, a predator-prey interaction has an emerging technology in the role of predator and a mature technology as prey. However, one can also visualize a situation where a mature technology is predator and emerging technology is prey (Pistorius and Utterback 1997, p. 78). Utterback et al. (2020) show this type of predator-prey relationship between plywood and oriented strand board technology (OSB) in a specific period of time (OSB is a composite of oriented and layered strands, peeled from widely available smaller trees).

## New Multiple Working Hypotheses for Technology Analysis

### Hypothesis of Killer Technologies

*Killer technology* is a radical innovation that with high technical and/or economic performance destroys the usage value of established techniques previously sold and used in markets (Coccia 2017d, e, 2019c). Killer technology can explain the behavior of innovations that generate a destructive creation for technical and industrial change in markets (Coccia 2019c). An example of killer technology is the diffusion of Solvay process that in the 1900s destroys the Leblanc process in the production of soda (Freeman 1974; Rosenberg 1976). To explore the behavior of killer technologies, a simple model shows how killer technologies destroys established technologies, generating technological change in markets. Let a killer technology $= Kl$ (a new radical technology), and let a victim technology $= V$ (established technology), the model is (Coccia 2019c):

$$\log Kl = \log A + B \log V \qquad (1)$$

$B$ is the coefficient of growth and indicates different patterns of technological evolution:

- $B < 1$, whether new technology $Kl$ destroys at a *lower* relative rate of change the old technology.
- $B = 1$, killer technology $Kl$ substitutes victim technology at a *proportional* rate of change.
- $B > 1$, whether killer technology $Kl$ destroys victim technology at *greater* relative rate of change.

This model (1) of the evolution of killer technology has linear parameters that are estimated with the ordinary least squares method.

Hypothesis of Technological Parasitism

Coccia (2019a, b, d; Coccia and Watts 2020) proposes the *theory of technological parasitism* to explain the evolution of technology considering a parasite-host relationship between technologies that generates the coevolution of overall complex system of technology. In particular, Coccia (2019d) argues that technologies have a behavior similar to parasites because technologies cannot survive and develop as independent systems per se, but they can function and evolve if and only if they are associated with other technologies, such as audio headphones, wireless speakers, software apps, etc. that function *if and only if* they are associated with host or master technology of electronic devices, such as smartphone, radio receiver, television, etc. In fact, a parasitic technology $P$ in a host or master technology $H$ is a technology that during its life cycle is able to interact and adapt into the complex system of $H$, generating coevolutionary processes to satisfy human needs and/or solve problems in society. This behavior of technologies can be generalized with the *theorem of not independence of any technology* by Coccia (2018a): the long-run behavior and evolution of any technological innovation T$i$ is not independent from the behavior and evolution of the other technological innovations T$j$. The theory of technological parasitism by Coccia (2019d) proposes a model to explain the evolution of technology with a relationship between a host *or* master technology ($H$ system) and a parasitic technology ($P$ subsystem). The logarithmic form of model is a simple linear relationship (Coccia 2019a, b, d):

$$\log P = \log a + B^{\circ} \log H + u_t$$

$P$ = evolutionary advances of parasitic technology
$H$ = evolutionary advances of host *or* master technology
$\log a$ = constant
$u_t$ = error term

$B^{\circ}$ measures the evolution of parasitic technology $P$ compared to host or master technology $H$. This theory suggests properties of the evolution of technology (Coccia 2018a, 2019a, b, d; Coccia and Watts 2020):

1. The long-run behavior and evolution of any technology depend on behavior and evolution of inter-related technologies (Coccia 2018a, 2019d).
2. Technological host *or* master with many parasitic technologies generates a rapid evolution of technological host-parasite system. Technological systems with fewer parasitic technologies and a low level of interaction with other technologies improve slowly (Coccia and Watts 2020).
3. Property of mutual benefaction between interactive technologies argues that the interaction between technologies reduces negative effects and favors positive effects directed to an evolution of reciprocal adaptations of technologies to satisfy needs and/or solve problems of adopters in society (Coccia 2019d).

## Conclusion

Determinants of technology and technological evolution are due to manifold factors, such as research and development investments, technology transfer, appropriate social structures with consolidated democracy, good economic governance, widespread higher education system, skilled human capital, moderate growth rates of population, purposeful nations with high economic-war potential, etc. (Coccia 2005a, c, 2006a, 2010, 2014a, c, 2015a, c, 2017c). Hence, technology analysis needs a method of inquiry based on multiple working hypotheses for a comprehensive explanation of relations supporting origin, evolution, and diffusion of technology, rather than applying a single hypothesis in isolation that can provide partial explanations and likely misleading results.

# Comparative Incentive Systems

Coccia Mario
CNR – National Research Council of Italy, Torino, Italy
Yale School of Medicine & Yale New Haven Hospital, New Haven, CT, USA

## Synonyms

Awards; Compensation; Motivation; Pay; Rewards

## Definition

The term "incentive" (from Latin *incentivum* "something that sets the tune") indicates a tangible and/or intangible reward that motivates people and creates favorable environmental conditions to maximize performance and/or to achieve specific goals in organization or competition or society.

## Introduction

The concept of incentive in management and economics is developed from behavioral sciences (psychology, psychobiology, and cognitive science) to analyze and explain what motivates people in organizations and/or competition. In general, the concept of incentive is associated with motivation, which indicates the forces that energize, direct, and sustain behavior. Management uses systems of incentive to motivate employees to work, to achieve strategic goals, to improve organizational and managerial behavior of firms in markets, etc. (O'Reilly and Caldwell 1980; Prendergast 2008; Pritchard et al. 1977; Reif 1975). Incentives can be categorized as intrinsic and extrinsic incentives, which have different characteristics and different effects in organizations and/or society (Fig. 1).

## Comparative Incentive Systems: Intrinsic *versus* Extrinsic Incentives

Comparative studies of incentive play an important role to clarify concepts and analyze causes and effects directed to support management and policy implications. In particular, incentives can be categorized in two main typologies, namely:

- *Intrinsic incentives* exist in the job itself and give personal satisfaction to individuals, such as autonomy, reputation, self-confidence, trust, empowerment, expense preference (e.g., leeway to invest monetary resources). Intrinsic incentives tend to emphasize pleasure and

**Comparative Incentive Systems, Fig. 1** Characteristics and effects of intrinsic and extrinsic incentives

enjoyment of people and support personality development in organizations (Benati and Coccia 2018; Coccia 2014; Coccia and Rolfo 2013). O'Reilly et al. (1991) suggest that intrinsic incentives may be important for affective commitment, job involvement, and motivation in organizations to support satisfaction and performance of employees (cf., Coccia and Cadario 2014). In fact, intrinsic incentives can satisfy personal needs directly by creating an intrinsic reward for those who perform the tasks (Frey and Jegen 2001; George 1992). Wright (2007, p. 60) argues that: "the intrinsic rewards provided by the nature or function of the organization may be more important to public sector employees than … performance-related extrinsic rewards." Hence, public organizations have better organizational performance and satisfaction of employees from intrinsic incentives that generate positive effects on job involvement and affective commitment (Coccia 2001; cf., Coccia and Cadario 2014; Coccia et al. 2015).

Intrinsic incentives can be awards associated with trophy, title, certificate, commemorative plaque, medal, badge, pin, or ribbon. Intrinsic incentives may also simply be a public acknowledgment of excellence, without any tangible token or prize (cf., Benati and Coccia 2018). The intrinsic incentives are given to a person in recognition of excellence and best performance in certain fields or positions, increasing its reputation (it is the general belief or opinion held by other people regarding a person's specific characteristics or abilities in certain public or private positions and organizations).

- *Extrinsic incentives* are pay and fringe benefits, gifts, promotion, advancement opportunities, etc. Extrinsic incentives are important in relation to continuance commitment to organizations (O'Reilly et al. 1991). However, extrinsic incentives play a relatively small role in the prediction of job involvement and affective commitment. Some extrinsic incentives are (Benati and Coccia 2018):
  - Compensation is based on: *(a)* guaranteed pay is a fixed monetary incentive paid by organizations to employees, such as base salary. Guaranteed pay also includes cash allowances (housing allowance, transport allowance, etc.), differentials (shift differentials, holiday differentials) and premiums (overtime, etc.); *(b)* variable pay is a non-fixed monetary incentive paid by organizations to employees. It is based on discretion, performance, and/or results achieved; *(c)* benefits are programs that organizations use to supplement employees' compensation, such as paid time off, medical insurance, and more.
  - Allowance is an amount of money given or allotted at regular intervals for a specific purpose. Allowances may be travel expenses, daily allowance (also called "subsistence allowance"), general expenditure allowance, medical costs, end-of-term allowance, etc.

## Relations between Intrinsic and Extrinsic Incentives and Management Implications

Incentives have a powerful effect on performance, motivation, commitment, and satisfaction of employees in organizations and society (O'Reilly et al. 1991, cf., Coccia and Benati 2018; Coccia and Cadario 2014; Coccia et al. 2015). Lincoln and Kalleberg (1990) argue that incentives may have a powerful effect on employees' attitudes and motivations towards their job and the company for which they work.

In general, the relationship between intrinsic and extrinsic motivation can generate a positive, negative, or neutral relationship in organizations (Frey and Jegen 2001; Staw 1976). Relevant theories analyze whether extrinsic rewards are positively associated with job satisfaction. Scholars argue that pay-for-performance applied to compensate and motivate public officials can produce, by itself, only minimally productive performance in public sector. In fact, the literature of public administration suggests that performance-based pay incentives are only marginally related to

public service satisfaction and motivation (cf., Benati and Coccia 2018). Moreover, intrinsic motivation, under certain conditions, can be undermined by pay for performance (i.e., extrinsic incentives): a performance-contingent monetary incentive to do something employees already enjoy can decrease their motivation to do it because the person is likely to view its action as externally driven rather than as internally appealing. In short, extrinsic incentives can produce crowding-out effects on intrinsic incentives and thus may negatively affect performance of employees and, as a consequence, of organizations (cf. also, Coccia et al. 2015). Frey and Jegen (2001, p. 592) confirm that extrinsic incentives, such as performance pay, can crowd out intrinsic motivation to do a good job. Most scholars also argue that crowding-out effects exist because public service motivation is associated with intrinsic motives and the love of money is related to extrinsic motives.

Frey and Jegen (2001) summarize the two premises of crowding theory: (1) all interventions originating from rewards and regulations accompanied by negative sanctions may affect intrinsic motivation, and (2) external interventions may crowd *out* or crowd *in* intrinsic motivation (or leave it unaffected).

In management, Self-Determination Theory explains the factors of intrinsic motivation (autonomy, competence, and relatedness) and of extrinsic motivation (internalization and integration) that support personality development and behavioral self-regulation to improve personal wellbeing and performance of people in organizations and society (Deci and Ryan 2004; cf., Coccia 2019). Self-determination theory suggests that extrinsic rewards are demotivating and dissatisfying to individuals (Deci and Ryan 2004; cf., Coccia 2019). As a matter of fact, extrinsic motivations can undermine perceived autonomy because they have a negative effect on intrinsic interest in a task or job. Deci and Ryan (2004) also posit that a variety of tangible contingent rewards undermine intrinsic motivation, but unexpected and task-noncontingent rewards have no effect on intrinsic motivation. In general, scholars claim that the explicit incentives of performance-related pay may crowd out intrinsic motivations. In fact, experimental research inspired by self-determination theory reveals that monetary (extrinsic) incentives generate two opposite effects: (a) they enhance extrinsic motivation (the price effect); (b) they threaten the need for autonomy, competence, and relatedness, lowering intrinsic motivation (the crowding-out effect). In short, financial incentives can generate a greater crowding-out effect of intrinsic motivation in public organizations than in private ones because there is more intrinsic motivation in the public sector and more of it can, therefore, be destroyed. Overall, with all other things equal, the crowding-out effect can be greater among civil servants having a stronger intrinsic motivation at the baseline.

In the context of incentive management, the goal theory suggests that motivation and incentive can increase organizational performance. The premise of goal theory is that people's goals play an important role in determining behavior. Goals direct work behavior and performance. People with a specific level of performance, or a given deadline for completion a task, will have a higher motivation to perform better than people with no set goal. Moreover, people having difficult goals will perform better than people with easier goals. Overall, then, the theory of goal setting provides a useful approach to improve work motivation, incentive, and performance in organizations and society (Locke 1968). Goal theory has a variety of managerial implications to support motivation and performance considering incentive systems: specific performance goals should systematically be identified and set in order to direct behavior and maintain high motivation; incentives should be given by setting goals at a challenging but realistic level; difficult goals lead to higher motivation and performance; finally, employee participation in the setting of goals is an intrinsic incentive that may lead to higher motivation to work and performance in organizations.

Studies in public administration also show that extrinsic and intrinsic incentives can reduce corruption in public service. However, the empirical evidence is still mixed (Georgellis et al. 2010).

Literature suggests that bureaucrats are led to corruption partly because their public service efforts on the job are not properly rewarded extrinsically or intrinsically. Kwon (2012) argues that PSM (public service motivation) can be an important intrinsic incentive for public service. Generally speaking, extrinsic motivation for public service (e.g., performance-based pay or promotion) or intrinsic motivation (e.g., public service motivation, or PSM) can channel bureaucrats' time and energy into public service and consequently reduce corruption. In particular, PSM as well as other intrinsic incentives appear to be important deterrents to corruption. In fact, empirical evidence reveals that PSM increases public service performance, and Kwon (2012) suggests that intrinsic incentives based on PSM can reduce corruption. Many studies have confirmed that extrinsic rewards can reduce (or crowd out) intrinsic motivation (e.g., Frey and Jegen 2001; Georgellis et al. 2010). However, the empirical evidence also suggests that both extrinsic and intrinsic motivations are effective in deterring corruption. Kwon (2012) presents statistical evidence that promoting intrinsic motivation with appropriate incentives can be effective in deterring corruption, possibly more than extrinsic motivation (such as performance pay). Moreover, although discretion (or delegation of authority) increases corruption, but when performance pay is strong, the bureaucrats use their discretion to increase public service performance rather than pursue corruption (Kwon 2012).

Overall, then, PSM can be an anticorruption best practice for public organizations.

## Conclusion

The domain of incentive systems can generate a variety of effects in organizations, competition, and/or society to increase productivity and wellbeing of people (cf., Coccia 2016, 2018). In general, the crowding-out theory suggests that external incentives can undermine intrinsic motivation (Frey and Jegen 2001). A *good* balance in public organizations between personal values (high public service motivation) and the nature of the task (providing services to general public) can lead to high intrinsic motivation, high performance, and low corruption (Kwon 2012). To conclude, the public sector has low dependence from financial incentives and for increasing efficiency and performance of public organizations, it is vital to balance both extrinsic incentives (e.g., pay) and intrinsic incentives, which are related to job satisfaction, job motivation and job involvement of public servants within organizations (cf., Coccia 2001, 2018).

C

## Introduction

Information is an important national resource which provides the public with knowledge of government, society, and the economy (McDermott 2010). Information Governance (IG) refers to establishing an environment and opportunities, rules, and decision-making rights for the valuation, creation, collection, analysis, distribution, storage, use, and control of information; it answers the question *"what information do we need, how do we make use of it and who is responsible for it?"* (Kooper et al. 2011, p. 196). On the other hand, Information Management (IM) concerns the control over how information is created, acquired, organized, stored, distributed, and used as a means of promoting efficient and effective information access, processing, and use by people and organizations (Lin 2011, p. 284).

This entry compares IG and IM between Australia and Vietnam through the reflection of a theoretical unified IGIM framework proposed by Nguyen et al. (2014) in government information policies of these two countries. Australia is at a high level of development of electronic government (e-Gov), and Gov 2.0 is central to the delivery of government reforms and improvement of quality of public services (Gruen 2009). On the other hand, Vietnam is ranked low in e-Gov development (United Nations 2014) where services are delivered by face-to-face and web-based Internet applications.

## Unified IGIM Framework in the Context of Gov 2.0

Electronic government (e-Gov) is the use of information technology in government contexts (Beynon-Davies 2013). Gov 2.0 refers to government using Web 2.0 technologies to create online communities, social networking, and user-generated content (Chun et al. 2010). Literature indicates that Gov 2.0 brings a number of benefits to both government and citizens such as emergence of citizen-created content (Veljković et al. 2012) and improvement of public sector transparency, policy making, and public services (Bonsón et al. 2012). However, it has caused a range of issues in IG and IM including difficulty in determination of authentic information (Jaeger et al. 2010), inadequately meeting information needs (Bertot et al. 2012), and high risk in security and privacy (Dwivedi et al. 2011). Based on a review of a significant number of academic references on IG and IM, Nguyen et al. (2014) developed a unified framework for IG and IM in the context of Gov 2.0 (See Fig. 1 below).

Figure 1 depicts the combination of IG and IM in information lifecycle control to enhance effective and efficient operation of organizations. Stage 1 emphasizes the IG level focusing on the prerequisite of development and comprehension of policies for information control. In Stage 2, IM is situated in IG and the information lifecycle is enacted. This stage focuses on the application of these regulations to develop and practice the information lifecycle management (ILM) processes in a Gov 2.0 context, the role of technologies in supporting the ILM occurs here. Accordingly, information lifecycle (from acquisition, creation, organization, maintenance, storage, distribution, retrieval, use, and disposal) is performed complying with the policies to ensure quality information. In Stage 3, reflective practice is used to consider areas for improvement, emerging issues, and lessons learned. This stage loops back to Stage 1 as a key feature of the iterative unified framework.

In order to assess this framework in the information policies of Australia and Vietnam, the relevant constructs of *people* and *technology* components need to be outlined. *People* and

**Comparative Information Management in Australia and Vietnam: The Case of Gov 2.0, Fig. 1** The theoretical unified IGIM framework in the context of Gov 2.0 (Adapted from Nguyen et al. 2014)

*technology* components are associated with both IG and IM. For IG, *people* refers to staff responsible for decision-making on information control mechanisms and IG and IM environment (Faria et al. 2013), which is supportive of the development of organizational *context*, *culture,* and ethical behavior of employees *(ethics)*. For IM, *people* refers to actors who play an important role in developing *context* and *culture* of IM and have appropriate *skills* for implementation of IM processes (McKeen and Smith 2007). Likewise, *technology* component at IG level refers to technological constructs supporting policymaking as well as ILM at the IM level.

To reflect the theoretical unified IGIM framework in Australia and Vietnam, a significant number of national information policies including laws, acts, rules, principles, guidelines, standards, and white papers by these two governments were reviewed and analyzed to determine the regulations related to the IG and IM constructs. A construct is reflected if it is regulated and explained in any policies reviewed. The content and scope of regulations related to each construct indicates its appropriate context (physical, Gov 1.0, or Gov 2.0).

## Comparative IG and IM in Australia and Vietnam

The extensive review of the literature and current national information policies and guidelines for IG and IM by Australian and Vietnamese governments has highlighted key similarities and differences between the reflection of the theoretical unified IGIM framework (see Table 1).

Table 1 illustrates each component and construct of IG and IM reflected in Australian and Vietnamese policies in comparison with those identified in the theoretical IGIM framework. The significant constructs, which are evident in the theoretical IGIM framework, are also evident in Australia's IG and IM, signifying that the key requirements of IG and IM in a Gov 2.0 context in Australia are addressed, and go towards reflecting the theoretical framework. Meanwhile, numerous constructs, which are covered by Vietnam's IG and IM, partially address IG and IM in a physical and/or Gov 1.0 context(s). However, several constructs (e.g., *culture, accountability,* and *compliance*) which refer to general requirements of IG and IM are applicable in both contexts (See Table 1). Furthermore, the imbalance of constructs which are evident in the Australia's IG and IM as compared to Vietnam's IG and IM also reflects different levels of the theoretical IGIM framework adoption in the different contexts. This becomes more obvious in the consideration of each component in both levels of IG and IM as discussed below.

### Consideration of Policies Constructs

Regarding IG, most constructs of information policies in Australia have met requirements of electronic and digital records created by Gov 2.0. For example, Australia has also applied several international and national standards supporting electronic records and metadata management such as ISO 16175: 2011 and AS 5044–2010. Furthermore, the National Archives of Australia (NAA) has issued guidelines for the implementation of an EDRMS (NAA 2011) and requirements of records management in the cloud (NAA 2015c). On the contrary, most of the policy constructs reflected in Vietnam refer to physical records control (SRADV 2015) or are at the first step towards an increased use of electronic records in the operation of governmental agencies (Prime Minister 2012). Although electronic records management is covered by the Archives Act 2011, there is a distinct lack of standards and detailed guidelines for an EDRMS as well as the use of the cloud for records management.

The emphasis on *privacy* and *confidentiality* is also a difference between IG in Australian and Vietnamese governments. In the Australian context, all privacy principles were established based on the balance between personal information protection and freedom of information addressing both the Privacy Act 1988 and Freedom of Information Act 1982 (McMillan 2013; OAIC 2014). While the Privacy Act ensures citizens' rights in personal information protection by the government, the Freedom of Information Act enables the government to promulgate and open

**Comparative Information Management in Australia and Vietnam: The Case of Gov 2.0, Table 1** Comparison of IGIM frameworks from the literature, Australian, and Vietnamese policies.

| Levels | Theoretical framework | Australia | Vietnam |
|---|---|---|---|
| **1. IG** | **1.1. People constructs** | | |
| | Context/environment | Yes (Gov 2.0 context) | Yes (Physical & Gov 1.0 context) |

| Levels | Theoretical framework | Australia | Vietnam |
|---|---|---|---|
| | Timeliness | No | No |
| | Appropriateness | No | No |
| | Uniqueness | No | No |

information to demonstrate and enhance its transparency and accountability (Mutula and Wamukoy 2009). On the other hand, Vietnamese information policies highlight *confidentiality* of information to comply with the National Confidentiality Act 2000, and little mention is made of open information or personal privacy before the validity of Information Security Law in July 2016. According to Baltzan et al. (2013), confidentiality refers to the assurance that information is available only to people who are authorized to access and it closely relates to privacy and security. The Australian Government has invested in developing software programs for protection of information from hackers and virus attacks, particularly for recordkeeping in the online environment (NAA 2004), whereas Vietnamese information policies have primarily focused on general principles and regulations for information *security* as well as the responsibility of organizations and individuals in the protection of national information. Regardless, both Australia and Vietnam exhibit a distinct lack of *quality* and *value* constructs for supporting IG policies (See Table 1, Section 1.2).

### Consideration of Technology Constructs

Concerning the technology component, the majority of the Australia's technological constructs reflect IG in the context of Gov 2.0 in alignment with the overall literature-based theoretical IGIM framework, especially the appearance of *Gov 2.0 technologies, mobility,* and *interactivity* constructs (see Table 1, Section 1.2). These constructs are a foundation to develop guidelines for social media and cloud use in IM to address Gov 2.0 context (See Table 1, Section 2.2). Both IG and IM technological constructs of the Australian policies confirm the ability of this framework to adequately meet the technological requirements for IG and IM in a Gov 2.0 environment. On the other hand, in the Vietnamese context, the lack of *Gov 2.0, mobility,* and *interactivity* in IG (see Table 1, Section 1.2) is also reflected in IM with limited *infrastructure, systems*, and *tools* that only support operations of the IM processess in physical or/and Gov 1.0 context(s) (see Table 1, Section 2.2). These shortcomings have also led to inadequate standards and guidelines in current Vietnamese policies addressing IG and IM in the process of Gov 2.0 adoption. Furthermore, the lack of *mobility* construct in IG framework by State Records and Archives Department of Vietnam (SRADV) is because mobile technologies, such as smart phones and devices, have only been used in information exchange by citizens in Vietnam (Kemp 2015). Literature also indicates the use of mobile technologies not only helps governments communicate with its citizens anytime and anywhere (Hung et al. 2013), it is also helpful in enhancing the connectivity between the government and citizens (Silic and Back 2013). Therefore, it is suggested that this construct should be present in any IGIM framework in the context of Gov 2.0.

### Consideration of People Constructs

The Australian policies place an emphasis on the IG *culture* construct as a strength of the organization in addressing cultural change when adopting new technologies. The investment in culture also aims to enhance staff's understanding of their obligations and compliance with policies and procedures of information and records management (NAA 2015a) (see Table 1, Section 1.1). This enables the Australian Government and NAA to develop *skills* and knowledge for employees in digital transition. In this context, employees are required to understand their agencies information needs and have professional skills to work collaboratively with information technology specialists

to operate IM processes to adapt to Gov 2.0 context (NAA 2015b) (see Table 1, Section 2.1). Particularly, the requirements of skills and knowledge for all staff, ICT specialists, and information and records management specialist working at Australian government agencies in online environment have been regulated in details by the NAA (2014). On the other hand, in the context of Vietnam, the *ethics* construct is clearly articulated (see Table 1, Section 1.1). This is evident in a range of Vietnamese ethical standards such as political bravery, loyalty to the fatherland, dedication, diligent and thrift, honesty, and righteousness for public servants in information and records management areas (Ministry of Home Affairs 2014). Furthermore, literature has indicated that Web 2.0 and social media have changed the way people work in information industries, leading to changed workplace culture (Cook and Pachler 2012). This change requires professional skills for employees to complete a variety of tasks using Web 2.0 and social media tools in IM. A lack of attention to the *culture* construct at the IG level in Vietnam has led to an absence of IM *culture* and a deficiency of *skill* training programs for staff to perform IM in the process of Gov 2.0 adoption (see Table 1, Section 2.1).

### Consideration of IM Processes and Practices Constructs

Most constructs within processes and practices of IM can be found in both the policies of Australia and Vietnam, which is similar to those in the theoretical IGIM framework. However, the distinction here is the operational context of Gov 2.0 in Australia and physical and/or Gov 1.0 in Vietnam (See Table 1, Section 2.3). This can explain the different standards and guidelines in IG between Australia and Vietnam. In the Australian context, current standards and guidelines adequately address IG and IM in the context of Gov 2.0. This ensures the IM processes and practices also address Gov 2.0 requirements. Meanwhile, the standards and guidelines for IM processes and practices in Vietnam are appropriate for physical and/or Gov 1.0 context (s) requirements. In addition, a relationship between several IG constructs and correspondent IM constructs is identified during the process of reflection of the theoretical IGIM framework in the Australian and Vietnamese policies. For example, several studies have indicated that timeliness, appropriateness, and uniqueness partly contribute to quality of information (Lajara and Maçada 2013) and value of information (Moody and Walsh 1999). Hence, the shortage of policies for quality and value constructs in both the NAA and SRDAV's IG might lead to issues in regards to *timeliness, appropriateness,* and *uniqueness* constructs in IM (See Table 1, Sections 1.3 and 2.4).

### Consideration of Information Quality Constructs

In the context of IM, three constructs (*timeliness, appropriateness*, and *uniqueness)*, critical for ensuring quality of information, are reflected in the theoretical framework but are not evident in usage by the Australian and Vietnamese governments (See 2.4, Table 1). This possibly explains the lack of the quality and value constructs in both Australian and Vietnamese policies (See 1.3, Table 1).

## Conclusion

This entry is one of a few studies distinguishing level and scope of IG and IM reflected in the literature as well as in information policies. The theoretical unified IGIM framework conceptualizes IG and IM as well as identifies relationships between these areas. The identification of the high-level of strategic IG and low-levels of operational IM is fundamental for determining the responsibility of each area.

Another main contribution of this entry for practitioners has been the examination of the theoretical unified IGIM framework in Australian and Vietnamese information policies. This reflects the framework in the different contexts of information policies. This is an important reference for Australian and Vietnamese governments in developing and amending information policies and guidelines in the process of Gov 2.0 adoption.

# Comparative Institutional Changes

Mario Coccia
CNR – National Research Council of Italy, Torino, Italy
Yale University, New Haven, CT, USA

## Synonyms

Deinstitutionalization; Institutional theory; Institutions; Rules

## Definition

Institutional change is the evolution of institutions, considered as rules and/or expectations that govern human interactions for socioeconomic development of nations.

## Introduction

Institutional theory is a theoretical framework that explains the evolution of social structures and processes (rules, norms, etc.) of both individual and organizational actions in society. A main research field of institutional theory is the analysis of how institutions change over time and space (Campbell 2004; Dacin et al. 2002). A debate within this research field revolves around how to conceptualize institutions and institutional change. The literature suggests different definitions of institution, which affect the perspective adopted to study and explain institutional change in society (cf., Kingston and Caballero 2009; Hodgson 2006; Coccia 2018d).

Veblen (1899, p. 190) argues that institutions are "prevalent habits of thought with respect to particular relations and particular functions of the individual and of the community." Hayek (1973), instead, considers institutions based on shared expectations, rather than rules in society.

In this research field, North (1990, p. 3; 2005) states that institutions "are the rules of the game in a society, or more formally, are the humanly devised constraints that shape human interaction . . .. reduce uncertainty by providing a structure to everyday life." According to this approach, institutions are based on formal rules (such as laws and constitutions) and informal constraints (such as conventions and norms). Aoki (2001, 2007) defines institutions as stable and shared systems of beliefs about the expected behavior of the members of a society in various contingencies. Greif (2006, p. 30) adopts a broad definition of institution: "a system of rules, beliefs, norms and organizations that together generate a regularity of (social) behavior." In brief, North (1990) sees institutions as rules, whereas Aoki (2007, p. 6) views institutions as "self-sustaining, salient patterns of social interactions" that give rise to "common knowledge among the players regarding a particular equilibrium path of the game." The literature also proposes different theoretical frameworks that explain institutional change, such as: designed-based approaches, evolutionary theories, and equilibrium perspective (see Fig. 1; cf., Kingston and Caballero 2009; Coccia 2018d).

## Comparative Theories of Institutional Change

### Designed-Based Theories of Institutional Change

In this approach, institutional change is a centralized and collective-choice process in which rules are explicitly specified by a collective political entity, such as community or state, and individuals

**Comparative Institutional Changes, Fig. 1** Different theoretical frameworks of institutional change

and organizations engage in collective actions, conflicts, and bargainings (Kingston and Caballero 2009).

Libecap (1989) analyzes the sources of "property rights" rules and sees the rule-changing activities as "contracting," which is a game governed by a higher level of political rules, and these higher-level rules, together with the activities and perceptions of the subjects, can shape the direction of institutional change of the lower-level (property rights) rules. Libecap (1989) also claims that institutional change is a "path-dependent" process: institutions may be a function of current technologies but also of previous technologies and institutions (cf., Coccia 2010, 2014, 2015a, 2018a, 2018b, 2019). In particular, technological evolution can be a main source of institutional change in society (Coccia 2015c, 2017b, 2018b, 2018c, 2019), though the relationship can be bi-directional, with vital interrelationships between technological change and institutional change (Coccia 2010, 2014, 2015b, 2018a). Moreover, conflict among superpowers can support both technological and social innovations, which can generate institutional change (Coccia 2018c, 2019a, 2019b, 2019d). For instance, the income tax, an innovative fiscal system established by law, originated in England during the Napoleonic Wars to restructure government finances for military requirements, generating a main institutional and social change (cf., Coccia 2015b).

Ostrom (2005) recognizes both exogenous causes of institutional change (e.g., technological change) and endogenous causes (e.g., the depletion of a resource over time). Ostrom (2005) also distinguishes between "operational rules," which govern day-to-day interactions, "collective-choice rules" for choosing operational rules, and "constitutional rules" for choosing collective-choice rules, whereas "meta-constitutional rules" are for choosing constitutional rules (e.g., the "rules" by which a civil war is fought; cf., Coccia 2019d). The process of institutional change is that each individual calculates the expected costs and benefits of a given institutional change and, if a "minimum coalition" necessary to effect that change agrees to it, an institutional change can occur. The notion of a "minimum coalition" is determined by higher-level rules; for instance, a parliamentary majority would constitute a winning coalition in a democracy. Ostrom (2005) argues that, if the beneficiaries of institutional change cannot commit to compensating the losers, powerful groups may be able to block beneficial change or impose inefficient change. A further impediment to efficient institutional change is the bounded rationality of players:

some or all of the players may hold incorrect beliefs about the likely effects of a proposed institutional change. Therefore, in these approaches by Libecap (1989) and Ostrom (2005), an institutional change depends on higher-level rules and on how decision-makers perceive the likely effects of a change in rules. Within this research stream, Alston (1996, pp. 26-7) points out that: "Institutional change can be thought of as the result of supply and demand forces in a society. We can think of demanders as constituents and suppliers as the government ... Institutional change results from the bargaining actions of demanders and suppliers."

However, these theories – which are based on institutional change as the outcome of a deliberate, collective-choice process of rule creation – may not explain why formal rules fail to produce their intended outcome.

**Evolutionary Theories of Institutional Change**

Many scholars analyze institutional change as an evolutionary process (Kingston and Caballero 2009; Coccia 2018d, 2019a). Evolutionary theories suggest that institutional change is due to human actions, such as learning, imitation, etc. The difference between evolutionary and designed-based theories of institutional change lies in the role of selection processes determining which rules emerge and adapt in socioeconomic environments (Coccia 2016, 2017a, 2018e). However, evolutionary theories do not consider a central mechanism (e.g., legislation) that causes a coordinated shift in the rules perceived by all the players.

New rules or behaviors here are due to a decentralized selection process, and, as a consequence, successful institutions adapt and grow in society, whereas unsuccessful institutions fall into decline and disuse in socioeconomic systems (cf., Coccia 2016, 2017a). In brief, new rules and patterns of behavior emerge from the uncoordinated choices of many individuals, rather than from collective-choice or political processes. The evolutionary theory of institutional change by Veblen (1899) considers the concept of "habits of thought," where habits are durable propensities to think and act in particular ways, which are however adaptable in the long term. Veblen (1899, p. 188, *passim*) also argues that: "the evolution of social structure has been a process of natural selection of institutions"– that is, a process of "natural selection of the fittest habits of thought," both through the "selection of individuals endowed with the fittest temperament" and through the "adaptation of individual temperament and habits to the changing environment through the formation of new institutions." Institutional change here is the coevolution of shared prevalent habits of thought (institutions) as well as of the habits of individuals. Therefore, the current habits of thought, both shared and individual, are "received from the past," affected by the present, and jointly affect the future path of institutional change (cf., Brette 2003).

Hayek (1973) develops an evolutionary theory of institutional change based on selection at the level of social group, where rules of conduct "have evolved because the groups who practiced them were more successful and displaced others (p.18)....thinking and acting are governed by rules which have by a process of selection been evolved in the society" (p. 11). Hayek (1973) also claims that group selection generates an overall configuration of rules that evolve toward an optimal configuration based on consistent general principles (e.g., the "law of liberty" based on protection of property rights).

Young (1996) states that the pattern of institutional change can follow a "punctuated equilibrium" process in which rapid switches between conventions are interspersed with long periods of stability.

Knight (1995) claims that different subjects may favor the emergence of different rules in society because they have greater bargaining power than others. Levi (1990) stresses that formal rules can give "power" to certain groups and that disadvantaged groups may force institutional change by "withdrawing their consent" from existing institutional arrangements. This withdrawal of consent could take the form of a organized collective action, but it might also occur through the decentralized actions of many individuals.

Overall, then, In general, evolutionary theories and designed-based theories regard exogenous

parameter changes as a prime factor of institutional change. Conversely, Veblen (1899), within evolutionary approaches, argues that institutions and habits are continually evolving: "The evolution of society is substantially a process of mental adaptation on the part of individuals under the stress of circumstances which will no longer tolerate habits of thought formed under and conforming to a different set of circumstances in the past" (Veblen 1899, p. 192).

Instead, Ayres (1944, p. 187) considers exogenous technological progress, one of the main driver of institutional change: "technological development forces change upon the institutional structure by changing the material setting in which it operates" (cf., Coccia 2010, 2014, 2015a, 2018a, 2018b). In this context, Nelson (2005, p. 169) sees changes in physical technology as the main driver of institutional change (Coccia 2017b, 2018c, 2018d). However, institutions can also affect technology generating an interaction, so that "it probably is useful to think of physical and social technologies as coevolving." (cf., Coccia 2019b, 2019c)

A limitation of evolutionary theories is that neglect the role of collective action and political process, while theories which view institutional change as the outcome of a centralized collective-choice process have difficulty explaining changes in informal rules (e.g., social norms). North (1990, p. 91*ff*) puts forward the idea that informal rules are reproduced through an evolutionary process of cultural transmission and play a key role in institutional change because they change slowly and cannot be altered deliberately (Coccia 2014). In particular, North suggests that institutional change is an accumulation of incremental changes rather than occasional, radical changes. Thus, the process of institutional change is path-dependent because individuals learn, organizations develop, and ideologies form in the context of a particular set of formal and informal rules. As a matter of fact, organizations can change formal rules to their benefit and may (indirectly) affect informal rules (Coccia 2017a, 2018d, 2018e). Roland (2004) suggests a relation between fast- and slow-moving institutions, in which the latter affect the former, just like the pressure of Earth system slowly building up along fault lines might occasionally trigger a sudden movement that generates an earthquake, changing the topography of a given region.

Overall, then, both North (1990) and Roland (2004) assume that changes in informal rules, rather than formal rules, are the main drivers of institutional change.

### Theories of the Equilibrium View of Institutions

The equilibrium approach of institutional change regards both formal and informal "rules" as devices allowing players to achieve a shared set of beliefs about each other's behavior, generating one of many possible equilibria. In this context, Calvert (1995, pp. 22–23) claims that: "Institution is just a name we give to certain parts of certain kinds of equilibria" (cf., Aoki 2001; Greif and Laitin 2004; Myerson 2004). In particular, institutions here are identified with equilibrium patterns of social behavior, rather than rules that induce the behavior. In this perspective, institutional change is due to changing expectations, rather than changing rules. Moreover, theories based on institutions as rules consider the enforcement of rules separately from their content, whereas the equilibrium perspective suggests that enforcement is endogenous.

In general, exogenous parameter shifts, such as changes in technology or preferences, can disrupt equilibrium, leading individuals and organizations to change "formal rules" to achieve a coordinated shift of many players' beliefs about each other's strategies. In this equilibrium approach, Greif and Laitin (2004) introduce the term "quasi-parameters," which are exogenous in the short run, but gradually change as a result of the play of the game, generating endogenous institutional change in the long run.

## Conclusion

Scott (2001) highlights that the literature of institutional theory has focused on institutional

construction and on convergent change processes. However, an equally important topic in this research field is deinstitutionalization: "the processes by which institutions weaken and disappear" (Scott 2001, p. 182). Scott (2001, p. 184) states that: "it is useful to place studies of deinstitutionalization in a broader context of institutional change, since the weakening and disappearance of one set of beliefs and practices are likely to be associated with the arrival of new beliefs and practices." Other studies about institutional change focus on transnational processes and carry out field-level investigations involving multiple organizations or families of organizations.

According to Dacin et al. (2002), a fruitful line of inquiry in institutional theory explores the moral dimension of institutions, of institutional change, and their relation (cf., Selznick 1996). A further interesting field of research proposes that institutional change is affected by the critical interaction between institutions and individual self and character (e.g., assigning responsibility, demanding accountability to assess the achievement of each person, etc.; cf., Scott 2001). To conclude, the vital challenge for institutional scholars is to explore this *terra incognita* with interdisciplinary perspectives and to exploit the diversity of viewpoints, within the domain of institutional theory as well as outside its boundaries, to generate breakthroughs that improve human interactions and social behaviour, and support paths of development in society (Coccia 2019).

[2]School of Public Administration, University of Central Florida, Orlando, FL, USA

## Synonyms

Metropolitan governance; Regional institutions; Regional organizations

## Definition

Regional planning organizations and institutions are very helpful to provide information, order, and stability for decision making in the public sphere.

## Introduction

Institutions provide order and stability and guide decision making in the public realm. Institutions are ubiquitous; they include, for instance, the

formal organizations and processes that determine the allocation of federal funds for transportation related infrastructure projects across metropolitan areas. They also include informal, but no less important, norms of practice that shape behavior of decision makers. Informal but routine communication and information exchanges structure relations that can complement formalized governance arrangements. Although both elements work in combination to affect change, this chapter is centered on the former and uses two contexts – United States and Brazil – to illustrate the role of formal regional organizations in metropolitan governance.

## Formal Regional Institutions in the US Context

The US local government landscape is often described as polycentric or fragmented. Associated with regional fragmentation is competition among local governments for economic development, conflicting land use goals, extensive variation in zoning tools and land use implementation mechanisms, and uneven public transportation and mobility systems. Needs vary from community to community, as do community assets, such as natural or recreational amenities or affordable and accessible housing. As such, there are often challenges in reconciling diverse policy preferences and coordinating joint activities across a region. Formal regional institutions provide a macrolevel perspective on these and other issues.

The presence of, and participation of cities in, regional institutions provides a means through which local officials can more easily solve common problems, pursue more collective benefits, and manage potential conflicts. Regional institutions reduce uncertainty by standardizing processes, facilitating information exchange among members, and reducing information asymmetries that prevent local governments from recognizing the potential gains from undertaking coordinated policy actions.

Regional institutions are present in most large metropolitan areas and provide a venue for discussing public policy problems and reaching collective solutions. Hawkins et al. (2016) describe "collaborative regional institutions" as providing a bridge between policy actors and that support the conditions for greater social capital to be accumulated among local governments within the region. Repeated interactions, facilitated by the regional organization, can develop and reinforce shared norms, mutual trust, and reciprocity among local government officials. This social capital is crucial for successfully addressing common policy problems.

Regional institutions also independently collect and disseminate information that local governments rely on to make individual decisions in a variety of policy realms. For example, in the Orlando, Florida region, the Metro-Orlando Economic Development Commission (MOEDC) is a region-wide organization that local governments actively participate in to receive technical assistance in business recruitment and retention and to enhance their capacity to support economic growth. While it works with individual cities, the MOEDC also prepares the Orlando region to compete most effectively by promoting legislation and updates to regulatory and incentive policies that will benefit the entire Orlando region. Although regions may substantially differ in the types of institutions working in these capacities, there are some common regional organizations in the USA:

### Councils of Government

Councils of Governments (COG) are professionally staffed regional organizations that are comprised of local government members within a specific geographic area. COGS are not governments; rather, they are voluntary associations that bring together local governments to coordinate such matters as land use and transportation planning across a region. They also provide a forum for cities to discuss important cross-border issues and to improve exchange relations among local officials. In this capacity, COGS serve a brokerage role among local governments, and a voice for the needs of member government units within its geographic scope of service.

### Regional Planning Agencies

One of the primary objectives of regional planning agencies is to bring together cities and build consensus on policy issues that range from environmental protection and affordable housing, to economic development and land use planning. City governments can voluntarily participate in regional planning agency forums to explore potential collaboration opportunities and to develop strategic regional plans. An example of regional planning agency described by Hawkins et al. (2016) is the East Central Florida Regional Planning Council (ECF-RPC). The ECF-RPC provides structure to informal relations and promotes regional sustainable development among 78 member cities and towns of the Orange, Brevard, and Volusia FL metropolitan areas. The ECF-RPC serves as a formal venue to facilitate community outreach and engagement and to develop collaborative and cross-cutting approaches to transit-oriented development across very different communities.

### Metropolitan Planning Organizations

Metropolitan Planning Organizations (MPO) are created by federal law and are designed to implement the transportation planning process in metropolitan areas with populations greater than 50,000. MPOs provide local governments input into the planning and implementation of federal transportation funds by overseeing the development of regional Long Range Transportation Programs (LRTP) and Transportation Improvement Programs (TIP). MPOs also facilitate collaboration between governments, organized interests, and stakeholders in the planning process and provide an organizational structure for local governments to participate in decision-making so that their transportation needs are reflected in regional priorities.

## Formal Regional Institutions in the Brazilian Context

Similar to the USA, Brazil has different levels of sub-national governments. The country is organized by states and municipalities, with one federal district (the capital – Brasilia). Based on the Federal Constitution of 1988, states are enabled to establish metropolitan regions. These are constituted by groupings of municipalities that have contiguous borders. In January 2015, the Metropolis Statute was approved, which established guidelines for the planning, management, and implementation of "public functions of common interest" in metropolitan regions. This federal level legislation is intended to promote a region-wide perspective of development in Brazil. It also provides a means to mitigate conflicts among cities, to implement shared management instruments across cities, and finance urban-metropolitan development.

Integrating transportation and mobility into the urban fabric is major focus of local and regional land use planning and development in Brazil. The prominence of urban mobility and long-range planning, as a public function or responsibility in metropolitan areas, is set forth by the Federal Constitution of 1988. In this document public transport is made explicit, with municipalities being responsible for the organization and provision of urban mobility services. Since 2001, federal law requires municipalities with more than 500,000 to develop urban mobility master plans, and in 2012, with the approval of the National Urban Mobility Policy (PNMU), all municipalities with more than 20,000 inhabitants are mandated to develop mobility plans and integrate them into their city-wide master plans.

With these mandates, metropolitan governance and management is particularly important in Brazil. Formal regional organizations, noted below, play an important role in prioritizing metropolitan investments, expanding and integrating infrastructure across the region, and promoting sustainable development and professional management of services. The challenge of metropolitan management, as far as institutions are concerned, is to face the difficulties of establishing real political territories (Fernandes 2013).

### Metropolitan Coordination

Metropolitan-wide organizations in Brazil provide a means to coordinate a variety of public functions of common interest among local governments within a region. Public transportation, road systems and basic sanitation, land use controls, and economic development are among the

public functions metropolitan organizations work collaboratively with cities to manage. For example, the Coordination of the Metropolitan Area of Curitiba (COMEC) was established by the State of Paraná in Southern Brazil. Its primary objective is to coordinate public functions of common interest among the 29 municipalities that make up the Metropolitan Area of Curitiba.

### Regional Planning Agencies

Regional Planning Agencies play an important role in metropolitan areas. For example, in the City of Curitiba (located in State of Paraná in south Brazil) the Institute for Research and Urban Planning of Curitiba (IPPUC) aims to coordinate the urban planning and monitoring process of the city to ensure the actions of the municipality are compatible with those of the metropolitan region. The organization also conducts research on sustainable development ad formulates urban plans and reviews development projects for consistency with the to the regional and city master plans. Through these activities, the IPPUC creates integrated social and economic solutions for urban problems, articulates policies and guidelines for attracting investments in the region, and facilitates the implementation of municipal level plans, programs, and projects.

For example, the IPPUC is responsible for the METROGEO – Metropolitan System of Georeferenced Information, which is an advanced software tool for managing the territory of the Metropolitan Area of Curitiba. This enables the standardization and consolidation of the geographic information of the region, and it facilitates information exchanges among cities to inform decision making.

## Conclusion

In both the academic and practitioner communities, arguments are often made for more coordinated action across cities to adequately address public policy problems. In both the US and Brazilian contexts, regional fragmentation can inhibit collective action and stymy the development of regional solutions for shared policy problems. The organizations briefly described in this chapter are not a panacea for regional planning and action. Rather, they are one element of regional governance. In Brazil, the formal regional organizations described in this chapter promote regional coordination but also seek to advance more transparent behavior of public leaders, aim to control corruption, and work to ensure the adherence of sub-regional organizations and governments to regulations, codes, norms, and standards. In the US context, the regional organizations that are described aim to facilitate mutual understanding and serve as a venue for joint decision making. In both cases, however, formal institutions provide a means to ensure greater effectiveness of public policy.

# Comparative Models of Inquiry

Mario Coccia[1,2] and Igor Benati[1]
[1]CNR – National Research Council of Italy, Torino, Italy
[2]Arizona State University, Tempe, AZ, USA

## Synonyms

Research methods; Scientific method; Study methods

## Definition

Models of inquiry are methods of organized and systematic scientific process used by scholars for controlled investigations and experiments to logically and efficiently solve theoretical and practical problems, and generate whenever possible discoveries and/or science advances. Comparative is a concept that derives from the verb "to compare" (Latin *comparare*, derivation of *par* = equal, with prefix *com*-) and is a systematic comparison, in this case, of the models of inquiry.

## Introduction

Methods of scientific inquiry are important patterns to understand scientific problems and explain causes of natural phenomena and social issues (cf., Coccia and Benati 2018; Coccia 2017a, b). They generally aim to obtain new knowledge in the form of testable explanations, conjectures, and generalizations that scientists can use to explain and predict phenomena in nature and society (Kaplan 2009). The main elements of the methods of inquiry in a hypothetic deductive approach are: (a) observation and measurement of elements concerning a subject investigated; (b) hypothetical explanations of the subject of inquiry; (c) controlled experiments for testing hypotheses; and finally (d) prediction of phenomena (cf., Coccia 2017; Benati and Coccia 2017). In order to clarify the methods of inquiry, it is useful to study their development within the philosophy of science (West Churchman and Ackoff 1950).

## Development of the Methods of Scientific Inquiry in the Philosophy of Science

The history of scientific inquiry started with *rationalism*, which focused on the vital role of reason in science. Within this approach, the Greek mathematicians had the purpose to systematize the general properties of space, i.e., geometry. Reason was a faculty that had fundamental features: it provided information concerning the essence of things, and it showed how to move from it to other characteristics of the world. Reason provides "clear and distinct" ideas and leads to conclusions from such ideas. The history of science seems to show that it is no easy task to identify clear and distinct ideas. Scholars have attempted to use rational methods of inquiry in some scientific fields, but the modern rational method does not always provide scientific truth. Hence, speculation and the clear use of reason are the only viable methods of investigation in certain fields of research, such as religion, morality, and metaphysics (West Churchman and Ackoff 1950).

The priority of reason was questioned by *empiricism*, which replaced reason with sensation as the source of all knowledge. Starting from simple ideas, and with the aid of the mental operations of compounding, relating, and abstracting, it is possible to show how other facts (ideas) can be derived. Locke tried to show how knowledge of general propositions should be derived through the process of comparing ideas. Berkeley and Hume showed that many ideas, which appeared simple to Locke were actually not so and, consequently, they raised the question of the adequacy of intuition as a criterion of simplicity. Locke's notion of a mental faculty of abstraction was refuted by Berkeley, who claimed that the mind can only perform generalizations, not abstractions, whereas Hume discarded the faculty of generalization. Berkeley eliminated Locke's material substance and based all reality in mental substance. Hume also demonstrated the inability to establish any causal connections with certainty. Hence, knowledge is replaced by belief: empirical analysis can only show our impressions (West Churchman and Ackoff 1950).

Subsequently, Kant suggested a *synthesis of reason and observation* by showing that both sensory observation and general understanding are essential for meaningful experience. It is true that there is something given in sensation (the sensuous intuitions) but, in addition to it, Kant argued that both space and time are *a priori* forms of experience, which are necessary to identify objects. In this approach, the mind must bring to its experience a principle of regularity: the natural world is well ordered because this is the

manner in which the mind makes understandable its sensuous intuitions (West Churchman and Ackoff 1950).

*Modern rationalism* relies on the *speculative method* and shares with traditional rationalism the belief that the mind can intuitively grasp truth. Yet, for modern rationalism, truth comes only at the end of the process, and very tentatively. Rational truth, in short, is derived through a process in which generalizations emerge from rich experiences by means of creative acts of the mind. For Hegel, the process was dialectical, proceeding from conflicts and working up by successive syntheses to some higher and richer stage. Bergson saw the process as intuitive, whereas Hall regarded it as imaginative insight. The speculative method is basic to all others and other methods must always make metaphysical or ethical assumptions that can only be justified by rational insight, intuition, faith, and the like (West Churchman and Ackoff 1950).

*The positivistic method* in science was developed by Hume with an attack on speculative metaphysics. Within this philosophical stream, Comte attempted to demonstrate that metaphysical thinking represented an intermediate historical stage through which man passed on his way to the full maturity of positive or scientific thought. Mach and Pearson conceived of scientific laws as a way of summarizing past experiences and of indicating expectations. These laws were not taken as irrefutable, exact, or as representing necessary connections in nature. They were merely taken as provisional cataloguing instruments (West Churchman and Ackoff 1950).

*The method of logical positivism* was a new empiricism that, unlike its historical predecessor, used logical rather than psychological analysis as an approach for the study of science. It took the understanding of language in terms of its form (syntax), content (semantics), and uses (pragmatics) to be basic to an understanding of methodological problems. It attempted to show how language construction can take place from a basic set of elements and rules. Language can be considered quite apart from any factual meaning. Meanings are fundamentally assigned by means of linguistic rules referring ultimately to protocol statements, which are more or less directly verified in experience. Explanation and prediction can then be given precise definitions as aspects of the scientific method (West Churchman and Ackoff 1950).

*The pragmatic method* operated a further synthesis and conceived science not in terms of what it actually does, but in terms of its aims. In Dewey's approach, the emphasis was on the resolution of an indeterminate situation, leading to a determinate one. In order to consider the meaning of science in a more precise sense, pragmatism introduced the distinction between goals (which are presumably attainable objectives) and ideals (which are unattainable but approachable within limits). Lastly, the attitude of pragmatism toward metaphysics and positivism was that they represent useful but partial methods, none of which are final in themselves (West Churchman and Ackoff 1950).

## General Models of Inquiry

In light of the above, the models of scientific inquiry can be divided into classical and pragmatic approaches:

- The classical model of scientific inquiry in science is based on deduction and induction. The origin of this scientific method dates back to Aristotle (384 BCE–322 BCE), who was one of the first to describe the deductive process, while Bacon (1561–1626) was the first scientist to develop inductive reasoning, which Galileo (1564–1642) later completed by adding his own mathematical formalization. The etymology of these concepts comes from the Latin verb *ducere*, to lead. The prefixes *in-* and *de-* indicate "in" and "from," respectively. In particular, *to induce* may mean "to lead to, to infer" and *induction* is "to lead to conclusions." *To deduce* may mean "to lead from, to draw from" and *deduction* is "to draw conclusions from." These approaches have the purpose of solving problems in science.

In particular, the *deductive model of inquiry* is "inference by reasoning from generals to particulars" or "the process of deducing from something

known or assumed" (Rothchild 2006). The deductive approach is the process of reasoning from one or more statements (premises) to reach a logically certain conclusion. It starts from theory and general ideas in order to predict new laws and, therefore, explain/discover new phenomena and/or problems. If the premises are true and the rules of deductive logic are followed, then the conclusion reached is necessarily true. Deductive reasoning (top-down logic) contrasts with inductive reasoning (bottom-up logic, cf., Rothchild 2006).

The *inductive model of inquiry* relies on collecting data and then deriving theoretical implications from them. Specifically, the inductive method starts from the observation of phenomena and traces back the laws that regulate them by means of hypotheses, analogies, and experiments (cf., Coccia 2017). Induction is riskier than deduction because it can lead to conclusions that may be uncertain. Overall, then, while the conclusion of a deductive argument is certain, the truth of the conclusion of an inductive argument may be probable (Rothchild 2006).

The *hypothetico-deductive model of inquiry* uses hypotheses to make predictions, rather than deriving laws from observations (Hempel 1965). Scholars, using the hypothetico-deductive method of inquiry, state hypotheses and then do experiments to test them. The hypothetico-deductive method of scientific inquiry can be applied according to either Popper's approach (1959) or Hempel's perspective (1965). Popper's approach is based on falsifying theories, whereas Hempel aims to confirm them, as illustrated in Fig. 1 (cf., Thagard 1988, p. 192ff).

Hanson (1958) criticized this model of inquiry because theory and observation were much more intertwined. Scientific realism argued that science is not restricted to observable facts but knowledge can be also achieved of what is not observable.

- The pragmatic model by Peirce (1992) is characterized by a "struggle" to replace doubt with "settled belief." This method of science is an experimental method, and the application of the pragmatist maxim reveals how hypotheses can be subject to experimental test (the concept of maxim is to: "consider what effects, which might conceivably have practical bearings, we conceive the object of our conception to have. Then, our conception of those effects is the whole of our conception of the object", Peirce 1992, vol. 1, p. 132). Dewey's conception of inquiry, found in his *Logic: the Theory of Inquiry*, is to understand a problem by describing its elements and identifying their relations. Identifying a problem that we need to solve is a sign that we are already making scientific progress; inquiry here is: "the controlled or directed transformation of an indeterminate situation into one that is so determinate in its constituent distinctions and relations as to convert the elements of the original situation into a unified whole" (Dewey 1938, pp. 104–105). Smith (1978, p. 98, original emphasis) argued that: "Peirce aimed at 'fixing' belief, whereas Dewey aimed at 'fixing' the situation."

Peirce called his pragmatism the *logic of abduction*, based on the simple visualization of phenomena. In fact, many visual stimuli are

**Comparative Models of Inquiry, Fig. 1** Hypothetico-deductive method. (Adapted from Thagard (1988, p. 192))

impoverished or ambiguous and people are adept at imposing order on them, creating hypotheses to explain what has been observed. Hence, abductive reasoning (also called abduction) is a form of logical inference, which starts with an observation then seeks to find the simplest and most likely explanation. In abductive reasoning, unlike deductive reasoning, the premises do not guarantee the conclusion (Thagard 1988).

- Finally, analogy has a vital role in models of inquiry, because the solution of problems in one scientific field – source domain – can be used for solving and explaining theoretical and empirical problems in other scientific fields – target domains, such as similar target therapy for different cancers in medicine (cf., Oppenheimer 1955).

## Specific Methods of Inquiry in Social Sciences

Although it is difficult to provide a comprehensive review of all specific methods of inquiry adopted in science, some of the most common approaches are described below.

### Experimental Method

This research method aims to explain human behavior by means of controlled laboratory experiments (e.g., Milgram's experiment on obedience). In particular, a sample of individuals is analyzed on specific activities and, so as to provide reliable results, the participants are motivated with cash in order to mimic the real world.

### Counterfactual Methods

The counterfactual method of causation can be explained in terms of counterfactual conditionals, in the form: "If *A* had not occurred, *C* would not have occurred." Most counterfactual analyses focus on singular causation: "event *C* caused event *E*." The best known counterfactual analysis of causation is by Lewis (1973). However, heated discussions have raised doubts about the adequacy of any simple analysis of singular causation in terms of counterfactuals (Collins et al. 2004).

### Multiple Working Hypotheses

The method of multiple working hypotheses (MWH) involves the development, prior to research, of several hypotheses that might explain the phenomenon under study, which is likely to result from several causes, not just one (Chamberlin 1897). All possible hypotheses are considered and compared to clarify the scientific problem under study, including the possibility that none of them are correct and that some new explanations may emerge (Johnson 1990; Railsback 2004).

### Game Theory

A "game" is any activity with the structure of a contest, in which what one player decides to do, simultaneously or not simultaneously, depends on what that player expects the other players to do. The crucial element is the payoff – player's preferences over outcomes – associated with each possible combination of moves by the two sides (Watson 2002, p. 39). In this model, it is supposed that a rational choice is made among alternative strategies of action. This logical approach has been applied to economic bargaining, political negotiation, the conduct of war, social behavior of cooperation (envelope game), etc.

### Multi-agent Programmable Modeling Environment

This approach can make use of different software platforms, such as NetLogo, an agent-based programming language and integrated modeling environment. The environment created by the software enables the exploration of complex phenomena by testing hypotheses in a virtual lab. These platforms are based on extensive libraries including models in a variety of scientific fields, such as economics, biology, physics, chemistry, psychology, etc.

## Conclusion

The methods of inquiry in social and natural sciences include many phases to develop the process of scientific research: study concept, study design, working hypotheses formation, data acquisition, experiments, data analysis and interpretation,

statistical analyses, and critical revision of results for important intellectual content. Reproducibility of results by other scholars is vital to reanalyze scientific data to validate or reject findings and/or theories. In general, science advances are essentially due to individual scientists (principal investigators) who form hypotheses, and perform controlled experiments to solve/explain problems, leading teams. However, modern science is more and more often performed by communities of scholars through international collaboration (Coccia and Wang 2016). In fact, the phases of the process of scientific inquiry are assigned to different scholars and/or teams across the world (e.g., in medicine, astronomy, etc.). This dynamics of science generates the convergence between applied and basic sciences, as explained by Coccia and Wang (2016), and likely the application of similar methods of inquiry in different research fields to solve/explain problems. Overall, then, scientific discoveries and science advances in current interdisciplinary research fields are increasingly multifaceted, requiring diverse models of inquiry to generate concepts, create new hypotheses, and perform controlled experiments involving various teams worldwide. Induction, deduction, and the other methods of inquiry described above may differ from one another but they are never contradictory. Rather, they are complementary tools that facilitate problem solving and accelerate knowledge creation within and across research fields.

# Comparative Performance Systems

David M. Mello
Faculty of Economic and Management Sciences, Mafikeng Campus, North-West University, Mafikeng, South Africa

## Synonyms

Employee assessment; Employee evaluation; Monitoring employee performance; Performance appraisal; Performance reviews

## Definition

A plethora of definitions can be found in the literature on performance management regarding what constitutes a performance management system. For purposes of this entry, a performance management system refers to an interlinkage of carefully designed processes and activities performed to assess and optimize individual performance, as well as reward and continuously develop employees for the achievement of the overall organizational goals (Mello 2014).

## Introduction

Different performance management systems can be identified across the globe. In the public sector, performance management systems were introduced to deal with concerns over the effectiveness of public institutions. Similarly, the need to satisfy the growing and changing needs of members of the public was another consideration for the introduction and improvement of performance management systems. The success of public sector institutions depends on the caliber of employees on their payroll. The performance of employees needs to be managed, following a policy and a performance management system that is suitable for the institution, its unique environment, as well as its employees. This entry provides an overview of common features identifiable across performance management systems and outlines the evolution of performance management systems within the public sector context. Furthermore, this entry focuses on contextual issues that may give each performance management system a unique flavor and identifies common problems in performance management systems.

## Common Features of Performance Management Systems

Performance management systems are designed to achieve almost similar objectives. These objectives are, among others, improvement of organizational effectiveness and efficiency, motivation of employees, and improvement of employee morale. It is for this reason that performance management systems have similar features. These features include, but are not limited to, their alignment with the organizational purpose statement, the existence of a policy on performance management, measurement of performance against set standards using specific techniques, behavior modification using rewards and sanctions, as well as employee training and development to improve proficiency in performing their duties. Each of these features is discussed separately in the following subsections.

### Alignment with Purpose Statement

A purpose statement or what is also popularly known as the vision of an institution provides direction that must be followed by all employees in the institution. A performance management system is a means to an end. It enables the organization to realize its long-term vision. A performance management system must be aligned

with the vision and be designed to support it. Furthermore, the system must be aligned with other systems, strategic goals, and values of the organization. A policy on performance management represents concrete steps that must be followed for a purpose statement of the institution to be operationalized.

### Policy on Performance Management

All public sector institutions require a policy statement on the management of employees at different levels of the institution. A policy of performance management represents a statement of intent and contains detailed guidelines on how performance management has to be implemented. The policy statement should also clarify the roles and responsibilities of stakeholders. Processes that form an integral part of the performance management system should be crystal clear in the policy statement. A policy of performance management must communicate organizational intentions clearly, leaving no room for ambiguity. A vague policy is open to different interpretations, which may be a source of discontent and disputes. It is important for a policy on performance management to make provision for appeals in instances where employees are not satisfied with the outcomes of their assessments.

No policy is cast in stone. It is advisable for public sector institutions' policies on performance management to be reviewed at intervals of 3–5 years or whenever there are fundamental problems that necessitate changes. The environment in which the institution operates will, apart from the 3- to 5-year guideline suggested in this entry, be the determining factor relating to the intervals at which performance management policies may be reviewed. A more stable organization may review its policy every 5 years, while an unstable or newly established organization may benefit from more regular policy reviews. An inclusive consultation process during the formulation and review of policy on performance management may improve buy-in among employees.

### Setting of Standards

Standards represent a yardstick against which the performance of a public institution and its employees can be measured. Standards manifest themselves in the form of quantity and quality of expected outputs. Apart from using standards to measure employee performance, standards are important for consistency and certainty among consumers of public goods and services. In setting standards, consumers of public goods and services must be consulted to establish their expectations. When setting standards, institutions and their employees need to be realistic. Setting unrealistic standards is tantamount to setting the organization and individuals up for failure. The ability to measure outputs is central to setting standards. Once standards have been set, it becomes easier to appraise individual employee performance.

### Performance Appraisal

Appraising employees is an integral part of any manager's core responsibilities. While performance reviews may be periodic in terms of policy, it is important to note that performance feedback needs to be provided to employees on a regular basis. Thanking an employee for a job well done does not have to wait for monthly or quarterly reviews. Similarly, an employee whose performance is below par needs to be informed promptly by his immediate supervisor. Performance reviews may lead to rewards, decisions to train, or develop an employee, and, in extreme cases, disciplinary measures may be preferred for an employee whose behavior cannot be corrected through one-on-one meetings with a supervisor or referrals to employee assistance programs where they exist. It is furthermore important to note that performance appraisal is not in any way a witch-hunt. Discipline resulting from consistent unsatisfactory performance reviews needs to be approached with great circumspect to allay fears and perceptions of a witch-hunt. It is only in instances where all corrective measures prescribed by policy have been exhausted that disciplinary measures may be considered in line with applicable labor laws. The principle of fairness must guide any decision to discipline an employee after a series of poor results from assessments.

The training and development of employees should be planned and implemented to rectify skills deficits identified during performance

reviews. Consequently, individual personal development plans must be developed. Adequate resources such as time, finance, advice from supervisors, and other relevant experts must be mobilized for all employees. It is, however, important to prioritize underperformers, while top performers do not have to be ignored as they too need to maintain or surpass their current momentum. A training and development budget in public finance should not be an afterthought.

## The Evolution

Performance management systems have evolved over decades. Earlier systems were more supervisor centered and were top-down in nature. The supervisor played a critical role in performance management, and his/her word was final. The standards set by supervisors would not be questioned. Similarly, the supervisor's assessment, whether objective or biased, would be final. It is for this reason that in the evolution of performance management systems, one can arrive at two main categories. These two categories are supervisor centered and inclusive performance management systems. The supervisor-centered performance management system is viewed as autocratic. As early as the eighteenth century, there were attempts to improve organizational and individual efficiency and effectiveness. Frederick Taylor is one of the earliest theorists who was concerned about the performance of employees. Taylor's system included, among others, incentive systems for higher performance, standardization of work through time study using stop watches, and the use of functional foremen (Tompkins 2005). Subtle and overt coercion was used to optimize employee performance. Punitive fines were used for underperformers. Similarly, top performers were rewarded with higher pay. Supervisor-centered performance management systems are still found in different countries and sectors. Unskilled employees are mostly subjected to supervisor-centered performance management.

Inclusive performance management systems emerged over the years due to labor rights and reforms in public sector management. Affording employees more rights led to the democratization of the workplace. Waves of public sector reforms, which can be traced to the 1980s to date, impacted positively on the evolution of performance management systems. Inclusive performance management systems were drifting toward what is known as 360-degree assessments. These types of assessments are gaining popularity due to their inclusiveness. They are preferred over supervisor-centered performance management systems, as the supervisor's subjectivity is moderated by two or more other assessors. These assessors may be clients or colleagues, among others.

## Contextual Issues

Similar performance management systems may be implemented in different countries with different results. Differences in results are a consequence of a number of factors in different continents and their regions. Developed and less developed countries are likely to achieve different results when implementing the same system of performance management due to inherent contextual issues. Some contextual issues that have a bearing on the success of performance management systems include, but are not limited to skills base, strengths of organized labor, leadership, and technology uptake.

### Skills Base

Developing countries have historically had a low skills base. This state of affairs is mainly due to poor education systems and poor investment in skills development. A corollary to this historical fact is skills flight from developing and developed countries. Skills flight, also known as brain drain, happens in developing countries and developed countries. Brain drain seems to follow the law of the jungle: "survival of the fittest." Countries that are well endowed with resources attract better-skilled employees. South Africa and Botswana in Southern Africa are, for instance, preferred destinations for skilled professionals who are searching for better-paying jobs.

Southern African Development Countries such as Zimbabwe, Lesotho, and Swaziland are poorly resourced, and therefore they cannot attract skilled professionals. Developed countries, on the other hand, can have a massive skills inflow, and therefore their immigration policies may largely focus on attracting scarce skills.

The relatively high unemployment rates in Southern Africa force employees to settle for second best applicants. It is common for employers to advertise and then re-advertise with the hope of attracting the best employees. The abundance of labor with no skills or irrelevant skills may lead to another problem, namely, skills mismatch. Skills mismatch occurs due to the unavailability of suitable candidates in the market and applicants accepting offers out of desperation for employment opportunities.

Appointing an employee who does not have the requisite skills is setting such an employee and the organization up for failure. An employee who does not have the requisite qualification, skills, and experience is more likely to deliver poor services to members of the public and achieve lower scores during performance appraisals. An organization that has more of these employees is likely to have more grievances related to performance appraisals.

Investing in education and skills development is one of the answers to challenges experienced in the performance management systems of developing countries. The second answer is the improvement of salaries. The two challenges related to skills shortages require developing countries to redirect their scarce resources to education and skills development. This approach will have positive spin-offs for performance management, organizational performance and development, and ultimately economic prosperity.

### Strengths of Unions

The strengths of unions differ from one country to the other. Differences in strengths relate to the nature of the state and labor policies that prescribe labor rights. States that are autocratic tend to limit labor rights. Contrary to the approach taken by states that are autocratic, democratic states afford individuals and groups of employee rights such as freedom of association and the right to strike. Workers in democratic countries are likely to be consulted when new performance management systems are designed or existing ones are improved. The strengths of organized labor may in extreme cases lead to a revolt against a performance management system that is perceived as infringing upon employee rights.

### Leadership

Leaders play a crucial role in performance management. A carefully designed system may fail in implementation due to the absence of leadership qualities in managers and supervisors. Leaders are the humane face of any performance management system. The role of any leader is to motivate, inspire confidence, and provide direction. Leaders who understand employees and what motivates them as groups and individuals are more likely to succeed. The inspirational role of a leader cannot be underestimated. Employees need a sense of belonging and appreciation. Successful leaders master the art of communication and the language of appreciation. The caliber of leaders that are found in different countries is largely influenced by cultural and religious practices. Circular and one religion-dominated countries may also display different sets of traits in leaders, which may impact on performance management systems differently.

### Technology Uptake

The public sector is known to be slower in technology uptake. The fourth industrial revolution has brought with it a workplace that is automated with machines and computers that are able to process large quantities of data much faster. The use of information and communication technology can have both advantages and disadvantages. Depending on the settings and programming of technological aids, technology can overcome subjective tendencies and limitations that supervisors may have in the collection, sorting, storage, and processing of information used for performance assessments. The downside of technology is its invasive nature and the safety of collected information, which may be a cause for concern among employees. The advantages of using technology

in performance management must always outweigh the disadvantages.

## Common Problems in Performance Management Systems

The effectiveness of performance management systems or lack thereof can be ascribed to the poor design of the system, insufficient resources, and human factors. Employee policies, which include recruitment, selection, training, development, promotions, remuneration, and succession planning, must support the existing performance management system. However, if a public sector institution has good human resource management policies, a poorly designed performance management system may still yield negative results. A badly designed performance management system can be identified on the basis of its overemphasis of employer interests at the expense of employee interests; overemphasis of financial incentives while downplaying nonfinancial incentives; lack of focus on employee training and development; a higher number of grievances in proportion to the number of employees; and rigidity, absence of recourse for unfairly assessed employees, and absence of regular system reviews.

Rater errors are prevalent in performance management systems. Rater errors result from the extent to which human beings can be objective and perceptions of those who are rated. Human relations may impact on the rater who is unprofessional and vindictive. Similarly, an employee who had run-ins with the manager may perceive any rating negatively due to strained relations. Rater errors are largely influenced by human factors that are complex and may differ from one work environment to the other and among employees.

Public sector institutions depend largely on the ability of tax payers to afford higher tax rates. Tax payers are in majority of countries financially constrained and will resist any attempt to raise the prevailing tax rate. Public institutions are consequently forced to do more with little available resources. Financial resources to reward top performers adequately are often a limitation in the public sector. To deal with this dilemma, non-monetary incentives need to be considered. Nonmonetary incentives could include, among others, a day or afternoon off from work, trophies for good performers, citation of individuals' excellent performance in meetings, and in-house journals and programs recognizing employees of the week or month.

## Conclusion

A careful look at performance management systems indicates that there are differences and similarities. The development of inclusive performance systems over the years is indicative of the growing recognition of labor rights and concomitant reforms that seek to improve overall public sector performance. Public sector institutions exist and function in environments that must be taken cognizance of in the development and improvement of performance management systems. It can be expected that performance management systems will have challenges and from there the need for regular inclusive reviews. Discourses on performance management systems should always be aimed at the improvement of public sector performance and the perennial desire to learn from good as well as bad practices.

# Comparative Performance Systems: An Assessment

Igor Benati[1] and Mario Coccia[1,2]
[1]CNR – National Research Council of Italy, Torino, Italy
[2]Yale University, New Haven, CT, USA

## Synonyms

Evaluation; Evaluation systems; Organizational performance; Performance assessment

## Definition

The term "performance" originates from old French *parfornir*, which means "to do, carry out, complete, accomplish." A comparative performance system (CPS) is a set of elements and processes to assess the capability of individuals, organizations, and other subjects to achieve strategic goals using, as benchmark, the performance of similar subjects and/or the previous performance of the unit itself. A CPS supports decision-making of management directed to accomplish strategic targets and satisfy stakeholders in competitive contexts.

## Introduction

In the context of public organizations, performance systems are based on units of analysis, measures of inputs, processes, and outputs (cf., Talbot 2010; Coccia 2001, 2004, 2005, 2006, 2008; Coccia and Benati 2018b). In particular:

- The unit of analysis of a performance system can be individuals, teams, activities, projects, and/or organizations as a whole (Leggat et al. 1998; Tampoe 2005; Venkatraman and Ramanujan 1986). Rummler and Brache (1995) propose a performance system based on three levels of analysis: (1) organizational level, (2) process level, and (3) job/performer level. In particular, (1) The organizational level includes the evaluation of strategies, corporate goals, structures, and deployment of resources. (2) The process level includes the assessment of inputs, outputs, and outcomes. Inputs here are resources contributing to the production of outputs (e.g., labor, physical capital, economic resources, human resources, etc.; cf., HM Treasury 2001; Hatry 1999). Outputs are goods and services (e.g., issuing licenses, investigations, providing policy advice, etc.). Outcomes are the consequences of the activities of public organizations in society (e.g., improved services, new services and products, etc.). (3) Finally, the job/performer level involves the performance analysis of job responsibilities and duties (cf. also, Venkatraman and Ramanujan 1986).
- Measures of performance systems can be *financial* and/or *nonfinancial*. Financial performance measures are usually based on monetary dimensions (e.g., price and/or cost; cf., Nakamura and Warburton 1998). Many organizations also apply nonfinancial performance measures, such as quantity measures for operations management and for monitoring the effort of production workers. Performance systems can also apply *absolute* and *contextual* measures. Absolute measures of performance are important for decision-making purposes, considering comparisons between units over multiple geographic regions and time periods. Instead, contextual measures, such as input-output ratios and productivity measures, are widely used for operational decisions of management in both the private and public sectors. Input-output ratios are an input divided by an output, such as working hours per employees in a month or year. In this context, productivity measures are the reciprocals of input-output measures, such as the average caseload per welfare worker (cf. also, Hatry 1999; Kazandjian et al. 1993). Some scholars argue that, if performance is not accurately measured, it cannot be accurately managed (Laughlin et al. 1994; Donabedian 1966; Flood et al. 1994; Barnsley et al. 1996; Coccia 2001; Coccia and Benati 2018a, b, 2017; Zuckerman et al. 1995).

Performance systems in public organizations are used by managers and stakeholders to evaluate individuals, teams, activities, projects, processes, planned strategic goals, etc. (Baird 1998; Hatry 1999). In general, performance systems are able to improve the capabilities of subjects/organizations, the quality of services and/or the reduction of costs, the maximization of profit (Andrews et al. 2010; Hatry 1999; Leggat et al. 1998; Singh et al. 2016; Miner 1980). In particular, performance systems support the accomplishment of strategic objectives by adjusting and improving the budgeting process and the efficient allocation of resources in organizations (Baird 1998).

## Comparative Performance Systems: An Assessment

A comparative performance system (CPS) is a set of elements and processes to assess the capability of individuals, organizations, and other subjects to achieve strategic goals using as benchmark the performance of similar subjects and/or the previous performance of the unit itself within a comparative framework. CPSs can support decision making of management directed to accomplish strategic targets and satisfy the desiderata of stakeholders in competitive contexts.

The most common comparative performance systems within and between organizations are balanced scorecard, Malcolm Baldrige National Quality Award, European Foundation for Quality Management, Performance Prism, and Kanji Business Excellence Measurement System. In particular:

- The balanced scorecard is a technique originally developed for firms to support the measurement of business performance, which is also a suitable approach for public organizations (Management Advisory Board 1997). Kaplan and Norton (1992) propose a balanced scorecard performance system incorporating both financial and nonfinancial performance measures. In particular, a balanced scorecard involves four dimensions: (a) the financial performance of organizations, which analyzes the allocation of resources; (b) the customer perspective, which assesses how organizations satisfy the needs of users; (c) measures of learning and growth, which look at the performance of organizations toward their employees; and finally (d) internal business processes, which evaluate the improvement of organizations themselves. These four dimensions need to balance short-term and long-term goals, internal and external performance factors, and financial and nonfinancial indicators (cf., Drury 2008). Garrison and Noreen (2000) define a balance scorecard as a cohesive set of performance measures (quantifiable targets and outcomes) indicating the extent to which an organization has achieved its strategic objectives. The main concern in this performance system is to create a climate that enhances organizational change and growth.
- The Malcolm Baldrige National Quality Award (MBNQA) is a quality management model based on seven factors driving performance: leadership, strategic planning, customer and market, information and analysis, human resources, process management, and organizational results. Since it mainly concentrates on customer satisfaction, this model is easily implemented by any organization (Lee et al. 2002).
- The system of the European Foundation for Quality Management (EFQM) is created on the basis of two fundamental systems for the measurement of quality management, i.e., the Malcolm Baldrige National Award and the Deming Award. EFQM is a diagnostic technique to measure the performance of organizations, and it supports the achievement of strategic goals that meet the expectations of all stakeholders through the involvement of all workers into continuous performance improvement processes.

The fundamental concepts of this performance system of EFQM are: adding value for customers, creating a sustainable future, harnessing creativity and innovation, managing with agility, developing organizational capability, leading with vision, inspiration, and integrity, succeeding through the talent of

people, and sustaining outstanding results. Moreover, through self-measurement, organizations may coordinate their priorities, distribute resources, and better develop their business plans (Osseo-Asare and Longbottom 2002).

– The Performance Prism is an approach developed by a team of researchers and consultants in the performance management area (cf., Neely et al. 2001). This comprehensive measurement system addresses critical business issues to which profit and not-for-profit organizations are able to relate (Neely et al. 2001, 2002). The Performance Prism consists of five interrelated dimensions for achieving sustainable excellence in any organisation: stakeholder satisfaction, strategies, processes, capabilities, and stakeholder contributions.
– The Kanji Business Excellence Measurement System (KBEMS) is based on the Kanji's Business Excellence Model (KBEM) and Kanji's Business Scorecard (KBS). KBEMS has two parts (A and B) that should be applied simultaneously to attain a complementary analysis of organizational performance. Part A is directed to the measurement of internal performance, according to the views of managers and employees. Conversely, Part B involves the assessment of performance by external stakeholders, such as customers, suppliers, governments, financial institutions, and society in general. In Part B, organizational values are based on process excellence (the organization uses benchmarking to improve its processes), organizational learning (the organization has a culture of continuous improvement and a learning attitude), and stakeholders' delight (the organization actively listens their needs, deals with complaints, provides relevant and reliable information, and displays ethical conduct; cf. Kanji 2002, p. 718 and p. 723; Kanji 2002a).

Figure 1 illustrates the main characteristics of these performance systems (goals, strengths and weaknesses).

The systems of the European Foundation for Quality Management (EFQM) and Malcolm Baldrige National Quality Award (MBNQA) are linked by similar criteria and principles. EFQM and MBNQA focus on the effectiveness and results of business management, and not on the quality of services and goods, and they serve as tools to improve the organization's performance to meet the expectations of all different stakeholders (Sampaio et al. 2012). The balanced scorecard implements and controls the strategy at all levels of the organization under study. Moreover, the EFQM system is more suitable for benchmarking, whereas Performance Prism or KBEM rely on the strengths of previously systems, such as the balanced scorecard, to address their shortcomings (see, Fig. 1). Finally, the main purpose of Performance Prism and KBEM is to support strategic goals in the turbulent contexts.

## Designing Comparative Performance Systems and Concluding Remarks

A comparative performance system has to follow some critical rules. Van Peursem et al. (1995) argue that performance systems should contain a balance of ordinal, nominal, and ratio indicators within the areas of economic factors, drivers of efficiency and effectiveness of organizations. In general, a comparative performance system should be designed according to the following general guidelines summarized in Fig. 2 (cf., Leggat et al. 1998):

1. Linking the comparative performance system to the organizational strategy to provide feedback on the attainment of strategic goals (Kaplan and Norton 1992).
2. Relying on a variety of measures (financial and non-financial) to provide a holistic view of an organization and a comprehensive assessment of performance (Cleverly 1985; Cleverly and Nilsen 1980; Van Peursem et al. 1995; Buenger et al. 1996).
3. Having a parsimonious set of indicators that balances multiple measures, selecting only those important for monitoring and adjusting organizational operations. This is because developing indicators for a comparative performance system can be costly and the available resources are often scarce in organizations.

| *Performance measurement systems* | *Goals* | *Strengths* | *Weaknesses* |
|---|---|---|---|
| Balanced Scorecard | Organizational efficiency | It monitors organizational strategy.<br>It implements and controls the strategy at all levels of the organization. | It does not show stakeholders' interest.<br>It focuses on past activities.<br>Lack of transmission of information to employees. |
| Malcolm Baldrige National Quality Award (MBNQA) | Customer satisfaction | It revolves around customer satisfaction.<br>It focuses on effectiveness and results of business management<br>It improves the organization's performance leveraging R&D management, leadership, strategic planning and process management. | It does not analyze the organization'sinternal processes and their interactions.<br>It does not focus on the quality of services and goods. |
| European Foundation for Quality Management (EFQM) | Customer satisfaction | Self-assessment approach; strengthening quality.<br>It fosters customer satisfaction.<br>It focuses on effectiveness and results of business management<br>It improves the organization's performance adding value for customers, harnessing creativity and innovation, managing with agility, developing organisational capability, etc.<br>More suitable for benchmarking. | It does not focus onthe quality of services and goods. |
| Performance Prism | Solve business issues | It is a flexible tool; It shows how new stakeholders contribute to performance.<br>It supports strategies, processes and dynamic capabilities in turbulent contexts. | Weak link between results and drivers. |
| Kanji Business Excellence Measurement System (KBEMS) | Organizational excellence | Multi-perspective of performance with manifold success factors: Leadership; delight the customer; management by fact; people-based management; and continuous improvement.<br>It suggests new strategies.<br>It supports strategic goals in turbulent contexts. | It is designed for senior managers. |

2 Ensuring that the comparative performance system provides a variety of perspectives on organizational performance

3 Limiting the number of indicators

4 Insuring the quality of data and indicators

5 Using stakeholders' input in the development of the comparative performance system

6 Deploying performance system results throughout the organization

⇓

**Achievement of strategic goals, higher organizational effectiveness and excellence**

**Comparative Performance Systems: An Assessment, Fig. 3** Process of a comparative performance system

4. Insuring the quality of data for reliable measures. Moreover, measures need to be comparable, consistent, and timely because they undergo intense scrutiny by stakeholders.
5. Involving managers (Luttman et al. 1994) and stakeholders (Kanter and Brinkerhoff 1981; Flood et al. 1994) in the development of an internally driven performance system to increase the probability that information is used for decision making processes for achieving excellence in markets. Moreover, measures and methodology of performance systems have to be openly communicated across the organization during their development process (Van Peursem et al. 1995).
6. Being deployed throughout the organization. Luttman et al. (1994) recommend the implementation of a reporting system that enables frontline workers to access detailed performance data, encouraging maximal performance improvements, while senior levels receive summarized performance reports.

Overall, then, comparative performance systems are directed to the achievement of strategic goals and excellence (cf., Figs. 2 and 3).

In general, a comparative performance system provides information to support managers and stakeholders in decision-making processes for achieving strategic goals and improving the cause and effect relationships of organizational behaviour to achieve vital results in turbulent markets (Cameron 1980; Kanter and Brinkerhoff 1981). Sicotte et al. (1998) highlight the

importance of identifying the organizational functions and interactions among them for an efficient performance system. Moreover, the presence of different organizations and contexts requires a variety of measures to capture performance (Kanter and Brinkerhoff 1981). Hence, a comparative performance system is primarily developed as a source of information to identify areas for organizational improvements and excellence (Mullins 1999; Miner 1980).

Overall, then, comparative performance systems in public organizations should measure the achievement of objectives set by strategic plans. The challenges of adopting efficient comparative performance systems in public organizations are directed to a goal clarification, monitoring the quality of data and measures, and reinforcing the link between system results and decision-making processes for decisions of strategic management. To conclude, efficient performance systems can improve organizational and managerial behavior to achieve strategic goals and excellence, and satisfy the expectations of all stakeholders, employees, customers, etc. in competitive contexts over time and space.

## Synonyms

Administration; Application; Management

## Definition

Policy implementation refers to a phase of the strategic planning process, when actions are taken to realize policy objectives. The implementation stage consists of identifying policy actors who are responsible for policy implementation,

allocating funds, developing infrastructure, building strategic support among actors who deliver services, and other actions taken to administer political decisions.

## Introduction

Comparative implementation research is a special theme within the field of public management and administration research. It gained momentum due to the increased pressure for evidence-based practices in the policymaking process. The early stage in the development of policy implementation research (1960s–1970s) has been triggered by the exploration of topics such as healthcare, privatization, human resource management, civil service, and budget reforms. Subsequent stages witnessed the development of a new scholarly perspective aiming to describe implementation as a distinct topic of political science scholarship (Allison 1971; Easton 1979; Pressman and Wildavsky 1973). The new perspective offered to isolate the implementation from other stages and dimensions of policy process in relation to a multitude of causal factors explaining policy outcomes (Bardach 1977; Brewer 1974; Mazmanian and Sabatier 1983; Pressman and Wildavsky 1973). Thus, instead of taking policy field, subsystem, or agency as the unit of analysis, researchers in this stream focused on the criteria of policy implementation process that would explain the causes of policy success and failure across various policy fields. During the 1980s and 1990s, significant efforts were made to develop a set of generalizable principles behind a uniform model of policy implementation (DeLeon 1999; Goggin et al. 1990; O'Toole 2000). These efforts produced a body of research emphasizing the role of multiactor and multilevel perspectives of policy implementation processes.

The study of implementation process is continuously challenged by the fact that the field is theoretically and conceptually underdeveloped. It lacks clearly defined concepts for comparing policy implementation processes across nations and placing them into separate classification systems. One of the problems challenging our ability to study comparative state government reform effectively is that scholars have failed to provide a plausible definition of successful implementation process. Cross-country analyses point out that a policy field followed over many years can change so radically that it bears little resemblance to its initial form (Matland 1995, 152). In this context, it appears to be quite difficult to assess the progress of reforms that are based in conventional means, such as goal attainment.

Explanations of what constitutes 'good implementation' may be divided into two categories, "control" and "learning" options (Hoppe et al. 1985). In the former, successful implementation is confined to 100% compliance with policy planners' design (it presupposes an accountability strategy that ensures the compliance of implementers and target groups). In the latter option, obeying the rules is not crucially important. By contrast, finding an optimal learning strategy is what guarantees the overall success of policy implementation (Hoppe et al., 588).

Ingram and Schneider (1990) suggest that implementation may be considered successful in any of the following cases:

(a) when agencies strictly follow directives and statutes issues by the national or subnational governments.
(b) when agencies meet specific indicators of success, achieve goals of the statute; they are also held accountable for reaching their goals.
(c) when improvements are identifiable in the improvement of the political climate around the program (in this context, an outcome may be considered successful when it produces learning) (Matland 1995).

Overall, these are only technical criteria of policy implementation success, and the failure to identify what is meant by successful implementation may serve as source of considerable confusion in public policy analysis.

## Evolution of Policy Implementation Research

The development of policy implementation research may be outlined as a process consisting

of at least three "generations" of interdisciplinary scholarship.

The first generation of implementation research (1960s–1970s) discussed the reasons for the successful and unsuccessful policy outcomes across various sectors, aiming to explain to what extent agencies comply with policy objectives. Questions covered by scholars working within this stream concerned implementation as a distinct stage of policy process. Many of the studies produced during this time served the goal of gathering data on the ways in which things get done at the local level rather than on the goal theory-building process (for more information, see Van Meter and Van Horn 1975; Mazmanian and Sabatier 1981).

The second stage (1970s–1980s) consisted in an even stronger empirical focus on implementation phenomena, which aimed to overcome the flaws of a-theoretical case study research through the creation of theoretical constructs, testable hypotheses, and relevant statistical techniques. This stage brought about the increased number of comparative small-n case studies, where the number of cases has been more than one, which allowed arriving at testable theoretical propositions (for more information, see Lester et al. 1987, Sabatier 1988).

Finally, the third stage of policy implementation scholarship (1990s–present) embraced studies aiming to create rigorous research designs, focusing on variables, hypotheses, case selection techniques, and the use of mixed-method techniques in acquiring and evaluating relevant data. This wave of research delved into the cross-national comparisons (small-n and large-n case study analyses) and relied on comparative research design as an important feature of political science scholarship (Goggin et al. 1990, 19). A series of studies produced during this stage discussed the utility of single, small-n and large-n case-studies and the ways in which their explanatory power could be improved through a careful selection of crucial and critical cases for the purpose of testing a theory. Generally, research on public policy implementation was vibrant and moving into a new century in qualitative and quantitative terms. Over time, it relied more heavily on multilevel and multiactor perspectives.

It is noteworthy that the development of implementation research has never been a steady process moving from one generation to another in a linear fashion. In fact, there has been a growing amount of scholarship that relied on a variety of perspectives. In this context, the term of policy implementation "generations" (Goggin 1986; Goggin et al. 1990) has been developed to cope with the growing amount of academic discussion focusing on the problem of managing change through policy implementation process.

O'Toole (2000) suggests that there have been various "strands" of policy implementation research beyond the stages of policy implementation scholarship, which span a few 'generations' of relevant policy implementation studies. Among these strands are: (1) institutional analysis, which included rational choice institutionalism and actor-centered institutionalism; (2) a governance approach, as well as political and policy regime theory, focusing on a process of governing rather than the organizational features of governments; (3) networks and management; (4) formal rational choice models (e.g., and deductive approaches); and (5) policy design and instrument approaches (273–282).

The observed strands did not necessarily make the distinction between the stages of policy formulation and policy implementation. However, research produced within relevant subunits of analysis contributed greatly to the existing theories and models of policy implementation process.

Institutional analysis, for example, has been successfully applied to the study of long-term solutions to problems of common-pool resource management. The governance approach extended the boundaries of policy implementation research by focusing on a broader set of theoretical propositions from game theory and regime framework. Finally, network and network management analysis scrutinized the forms through which most implementation develops (structural forms, multiactor networked patterns, etc.), whereas instrument approach built on a smaller number of policy implementation variables linking theory

with the design of public policy and implementation mechanisms (O'Toole 2000).

## Problems and Challenges of Policy Implementation Research

While the number of policy implementation variables is growing on a case-by-case basis, most of the existing analytical insights offer **methodological guidelines** rather than a set of theoretical propositions about policy implementation dynamics.

The observed guidelines, e.g., research strategies of policy implementation process, may be divided into at least two distinct categories, e.g., **"top-down" and "bottom-up" models**, which center around two distinct approaches toward the study of policy process, and accordingly on distinct categories of the actors involved in policy implementation stage.

Proponents of a **top-down model** assume that clarity of goals and control by the policy makers lead to more effective implementation and greater success in addressing problems. The implementation analysis that is located in this model tends to focus on factors that could be easily manipulated by policy makers at the central level (see Hoppe et al. 1985; Mazmanian and Sabatier 1983).

By contrast, supporters of the **bottom-up approach** emphasize target groups and service deliverers, arguing that policy change is in fact made at the local level. They start from a policy problem and then examine the strategies that are employed by relevant participants at different levels of the government as they attempt to deal with the issues that are consistent with their objectives (see Lipsky 1980).

In recent years, actors and processes, entrenched in various stages of reform, **have re-aligned in a growing body of research that, deals with issues of policy implementation dynamism**. The first and major step in this process occurred as a result of the difficulty observed in efforts to conceptualize the interaction between policy and setting or to construct any single policy theory that was "context free" (Matland 1995, 149). In view of the observed analytical difficulty, scholars experienced the increased pressure to bridge a natural division between the top-down and bottom-up units of analysis; and even though the means of doing so were never clear, some interesting and theoretically useful efforts transpired in establishing **a dialogue between the design and implementation processes.**

Hoppe et al. (1985), for example, asserted that the major problems at the stage of policy implementation emerge due to the **disconnected cognitive levels** and maps of reform designers, implementers, and target groups. In this respect, implementation research promised to significantly improve "high-level policy-makers' cognitive maps" of the developments leading to both expected and unexpected policy outcomes (582). The process of **cognitive mapping**, which is quite curious on its own, was based on the idea that policy-making is a continuous learning process, which starts from attempts on behalf of various actors of the reform to interpret data and transform it into action-oriented knowledge (or empirical and normative knowledge). The process of learning has been defined as "simultaneous problem identification, problem definition, and problem solving, which are in turn interrupted by all sorts of discontinuities," when programs are unrealistic and do not match the resource capacity of implementers (Ibid.).

A limited number of policy implementation studies have argued that top-down and bottom-up perspectives could be used **in reference to different cases** or otherwise combined depending on the issue at question. Some of the most often-cited perspectives within the area of policy implementation dynamism include Elmore's concept of **"forward" and "backward" mapping** (Elmore 1985), which helps identifying potential problems by comparing cognitive maps of policy formulators and policy implementers; Sabatier's **policy cycle perspective** (1988), which observes the development of policy as a function of political change; and Goggin et al. 1990 **communications model**, which places state implementers "at the nexus of a series of communication channels" (inducements and constraints from the federal, regional, and local levels) susceptible to distortions as a result of signal perception bias (Matland 1995, 151–152).

The usefulness of the above-mentioned frameworks depends on working assumptions, such as the role of ideas, interests, and institutions in policy process, or **the distinction between the stages of policy formulation and policy implementation in policy-making process**. It is well known, for example, that a number of competing policy models were developed prior to the emergence of policy implementation scholarship to explain how events occur to produce policy change. Some of these models are linear, while others are more complex. **The linear model of policy** developed by Lasswell (1951) and modified by scholars, such as Brewer (1974), Meier (1991), DeLeon (1999), included four steps taken in policymaking, e.g., agenda stage, decision stage, implementation, and evaluation stages). Subsequently, these ideas transformed into a **theory of policy cycle, suggesting that the relationship among the observed stages appear to be locked in a circular system.** Each stage requires significant resource inputs for the reform to take place.

Mainstream approaches, such as the **policy streams approach** developed by Kingdon (1984), do not focus on stages of policy process as such. Instead, they view the stages and processes of policy-making as being interconnected. Specifically, Kingdon argues that policy change comes about when streams – problems, politics, and policies – connect. This model suggests that the areas of expertise, politics, policy-making exist independently of one another until they come together under the pressure of policy advocates (policy entrepreneurs) entering the system during a critical moment of system opening described as "policy window." The streams do not merge, but rather interconnect, shifting policy agendas or changing the entire mechanisms of policy implementation.

The current stage of policy implementation research consists in the development of **theoretical insights** that aim **to move the analytical focus of political science scholars beyond a single issue or a single level of analysis**. Most of these insights rest upon various versions of institutionalism theory that are applied to the field of public policy and administration (among these versions are rational choice institutionalism, historical institutionalism, and sociological institutionalism). Matland (1995), for example, demonstrated that implementation stage results from actors' preferences and the level of conflict around policy goals. Based on these assumptions, he proposed that policy implementation stage results from (the choice of policy instruments, which corresponds with the level of ambiguity and conflict in policy implementation stage.

Based on these assumptions, the following types of policy implementation were identified: administrative implementation (low conflict-low ambiguity), political implementation (high conflict-low ambiguity), symbolic implementation (high conflict-high ambiguity), and experimental implementation (low conflict-high ambiguity) (145).

Similar to Matland, Chackerian and Mavima (2001) assert that different reform components have to be properly assessed and combined in order to ensure successful policy implementation. Building on criteria such as resource inputs (i.e., their size and similarity) and the time frame of policy implementation process, the author identified three possible effects that emerge from interaction among reform components, i.e., "synergy," "trade-off," and "avoidance." (Ibid.)

The above-mentioned findings of scholars are useful for understanding how the process affects policy outcome, as well as the relationship between the reform design and implementation is. However, these studies ignore **the reasons for the adoption of specific policies, or the difference between intended and unintended effects of policy-making process** (the role of policy actors vis-à-vis structural conditions of policy change).

It is noteworthy that some policies are not designed to fulfill their official goals, and many public sector initiatives are nothing more than **symbolic attempts** to appease various segments of the populace rather than improve the quality of public administration (Edelman 1964). Therefore, whenever political leadership is missing, there is a distinct possibility that a set of reform measures will end up going nowhere in terms of policy implementation. Thus, regardless of whether

there is a problem with the degree of consensus among the top-level public officials ("the unified nature of political will to reform"), or the quality of decision-making at the top level (it is autonomy and insulation from societal pressures), policy leadership dilemmas are highly consequential for the stages that following the process of policy enactment. In this respect, implementation difficulties may emerge for a number of reasons: politicians depending on a single group (or a few powerful groups) that promote diverse agendas; leaders diverting their attention to other areas in an attempt to pursue alternative or hidden agendas, or as a result of hectic decision-making style. One of the biggest flaws of the dynamic policy implementation models is, therefore, that **they ignore the difference between intended and unintended effects of policy implementation**, and as such, they do not fully contribute to the role of agency in policy implementation process.

Thomas and Grindle (1994) emphasize the importance of policy leadership in policy implementation process and suggest that the extent to which political actors (described as policy elites) should be involved in the process of reform implementation is influenced by the existing government's degree of legitimacy and autonomy of the existing government. First, if regime is stable, it is more likely to generate wide-ranging support for the program. Second, if regime depends on a few extremely powerful interest groups, it would be more difficult to ensure consensus among the top-level political elites concerning the goals of reform.

The assessment of the political resource needed to support reform program requires consideration of who supports and opposes reform program, as well as the degree of support required for reforms to take place. In addition to the political support, bureaucratic, financial, and technical resources must be evaluated.

The field of institutional economics provides valuable insights into the type of resources required in the policy implementation stage. Rodrick (1996), for example, distinguished between the processes of policy initiation and the process of reform consolidation, and suggested that "successfully initiating reform and sustaining reform may depend on different approaches" (9–41). In this perspective, "the process of policy initiation requires **independence or autonomy for the executive**, while consolidation of reform necessitates [the] building of legislative and interest-group bases of support" (in Williamson 1994, 468). Legislative support means that "all necessary regulations are taken in order to develop reform initiatives." Interest-group support means that "there is a consensus on the aims and the means of reforms, and major actors take decisions in line with their consensus" (Ibid.).

Interestingly, policy-making process nearly always results from a combination of actors' preferences and political context, including "selective" problem definition and implementation based on a perceived salience of an issue. In this respect, one of the most important gaps observed in the literature concerns the system of **"institutional capacities"** of a state undergoing political, social, and economic transition. The concept of state capacity refers to the ability of a state to achieve its own goals; therefore, it may serve as both structural and contextual variable of policy implementation context. Institutional factors define and underpin state capacity (in this case, rational legality associated with bureaucratic and administrative capacity). The particular types of institutional capacities in question overlap to some extent with the policy network dynamics noted above, particularly, in relation to the institutional attributes of the state.

Each of the existing models captures just a minor component of policy process operating within a dynamic policy context. Institutional analysis shifts the discussion toward the analysis of policy choice and the accompanying structural conditions thus extending the boundaries of microlevel analyses employed by policy implementation scholars.

## Conclusion

This entry has provided an overview of comparative implementation research as a special theme in public management and administration research.

It began with the discussion of challenges that the field of comparative implementation research faces, such as the difficulty of providing a clear definition of successful implementation, and in identifying concepts and categories for grouping diverse phenomena into separate classification systems. It was observed that the unit of analysis of policy implementation scholarship has changed over time, moving the analytical focus from the nature of policy field to the organizational prerequisites of change process, actors, and strategies accounting for the success and failure of policy implementation.

This entry has also provided an overview of major strands of policy implementation research, as well as themes and questions raised by political science scholars regarding the process of policy implementation on a cross-country basis. Analysis indicates that there have been a few overlapping stages of policy implementation research coinciding with at least three generations of political science scholarship. The first stage consisted of a-theoretical descriptive case study analyses that focused on policy implementation variables (conditions for successful policy implementation). The second stage included efforts to formulate and test hypotheses that were focused on comparative case study analyses. Finally, the third stage moved the entire focus of political science scholarship toward the development of rigorous research designs, variables, hypotheses, case selection techniques, and the use of mixed-method techniques for acquiring and evaluating relevant data. All of the above generations were influenced by diverse perspectives, such as the tradition of rational choice institutionalism, governance approach, networks and management, formal rational choice models, and, finally, policy design and instrument approaches.

The current stage of policy implementation research consists in the development of theoretical insights that aim to move the analytical focus of political science scholars beyond a single issue or a single level of analysis. However, while the number of policy implementation variables is growing on a case-by-case basis, most of the existing analytical insights offer methodological guidelines rather than a set of theoretical propositions about policy implementation dynamics. One of the key gaps observed in the literature concerns the lack of systematic effort to link the discussion of policy implementation to the discussion of institutional prerequisites of policy process. The analytical and predictive capacity of policy implementation research will significantly increase as long as it relies more heavily on multilevel and multiactor models situating the discussion within the broader context of political science scholarship.

# Comparative Policy Reforms

Colin Knox
Graduate School of Public Policy, Nazarbayev University, Astana, Kazakhstan
Ulster University, Belfast, UK

## Synonyms

Caucasus; Central Asia; Development reform; Public services improvement; Quality of life

## Definition

Quality of life: is an approach to comparative policy reforms which emphasizes the impact that public services will have on improving the daily lives of people, typically in terms of better health, education, employment, environmental, and personal safety outcomes.

## Introduction: Comparative Reforms to Date

In examining comparative policy reforms, the scope of this topic is defined by the author as reforms in developing countries. Many of the former Soviet Union states, for example, have sought to embrace a public sector reform agenda as part of a wider program of economic liberalization and transitioning to greater social development and prosperity. These countries have often looked to developed economies for comparative policy learning and "read-across" of ideas to their societies. This approach was encouraged by funding (donor) organizations, management consultants, and the mantra of new public management as a "one-size-fits all" global framework which could be easily adapted for developing countries. Existing research tells us that this approach has failed in developing countries and there is limited evidence on the impact of public management reforms in developed countries (Polidano 2001; Knox 2008; Pollitt 2013). An alternative pathway to public sector reform which is considered here is based on two key components: the need to move to an outcomes-focused approach, quite different from a preoccupation with structural/institutional reforms; and the adoption of peer-to-peer learning which helps to identify what exactly developing countries can learn from each other in a way which will increase the well-being of their citizens. The author uses three case study countries: Azerbaijan, Georgia, and Kazakhstan to illustrate the potential for comparative policy reforms and identify some of the conditions necessary to optimize peer-to-peer learning.

## An Alternative Approach

The alternative approach, described here, to the global management model is predicated on the

following important considerations for comparative policy reforms to be successful in developing countries:

- Understanding context is critical to the success of public sector reforms, particularly in developing countries, given the different stages of their development (Andrews 2008).
- Insufficient attention is paid to the implementation phase of public sector reforms.
- There has been an overemphasis on institutional reforms which are necessary but insufficient in creating efficient and effective governance, including an improvement in public services (Brinkerhoff and Brinkerhoff 2015). In short, limited attention is paid to the impact of public sector reforms.
- The influencing (or perhaps dominant) role which donors have played within developing countries in setting the course of a reform agenda, that has drawn largely on Western-style public management approaches, is now being challenged.

An alternative comparative policy reform framework is described here which is characterized by two features: the first is to consider the *impact* of reforms or interventions through an outcomes-based accountability approach – do they make a difference to the quality of people's lives; and the second is to acknowledge the importance of *context* in attempting policy reforms through a model of peer-to-peer learning. This framework is illustrated using three case studies in Central Asia and the Caucasus.

## Underpinning Concepts: Quality of Life and Peer-to-Peer Learning

One of the most obvious problems in developing countries is that public services are often provider-led, top-down, and disjointed for citizens who receive them. The difficulty with complex multi-level governance structures is that ministries, regions, and local government work through separate functional mechanisms which offer citizens very fragmented public services, resulting in a lack of "joined-up" government. Yet citizens' needs in health and social care, education, employment, etc. often straddle several public sector provider organizations. In short, the problem is one of top-down bureaucratic paternalism ("we know best"), which emphasizes processes and outputs but fails to focus on outcomes or the impact of public services on those who use them. While such criticisms could also be leveled at some developed countries, the legacy of centralized planning exacerbates the problem in former Soviet states.

By contrast, outcomes-based accountability is a conceptual approach to planning services and assessing their performance that focuses attention on the results or outcomes that the services intended to achieve (Friedman 2005; Pugh 2010; Boarini et al. 2014). The aim is to move organizations away from a focus on "efficiency" and "process" towards achieving better outcomes, the primary purpose of their organization and its officials. One way in which to operationalize an outcomes-based accountability approach is to use a "quality of life" framework where the ultimate outcome is to improve the quality of people's lives. To do this requires a shift in the way in which public services are provided towards an outcomes-focused, multiagency approach offering better value for public money by asking the question: How do public services impact on the quality of people's lives? Often this will depend on a range of social, economic, and environmental services which collectively go towards improving quality of life. What is important to highlight here is that these services will be context specific.

Acutely aware that previous global public management "solutions" have had limited or mixed success, one way to embed quality of life outcomes is through peer-to-peer learning between countries at similar stages of their development. This is where countries engage in exchanging and testing up-to-date knowledge which will build capacity, generate innovative solutions, and contribute to good practice in comparative policy reforms. This approach "avoids copying best practices of advanced economies and identifies best fitting and effective reforms which are appropriate for their country-specific

context through engaging peers in discussions, so they use lessons learned at home and implement what works best for them" (Effective Institutions Platform 2016: 3). In the three case studies outlined here, peer-to-peer learning took place through a network of countries in the form of a regional hub which was established in 2013 by the UNDP with the support of the Kazakhstan government and is located in Astana. Some 25 countries and 5 international organizations participate in the regional hub which serves as a "multi level platform where participating countries are engaged in exchanging and testing up-to-date knowledge which will build capacity, generate innovative solutions, and contribute to global agendas on civil service excellence" (Regional Hub of Civil Service in Astana 2014).

## Case Studies in Improving Quality of Life

To demonstrate improving quality of life through peer-to-peer learning, three case studies are considered here. Kazakhstan, Georgia, and Azerbaijan are at similar stages of development and provide case study examples to demonstrate an outcomes-based approach facilitated through peer-to-peer learning. In the most recent UNDP Human Development Index, for example, Kazakhstan, Georgia, and Azerbaijan scored: 0.788, 0.754, and 0.751, respectively (where 1 = the most developed countries) (UNDP 2017). All three countries are semipresidential or presidential republics, gained independence from the Soviet Union in 1991, and have been engaged in programs of policy reforms since then. Kazakhstan, for example, has witnessed a radical reduction in the number of political appointees and greater professionalization in its senior civil service. Georgia has been very successful in tackling corruption in the police, and Azerbaijan has seen the development of a number of successful e-government initiatives. To operationalize "quality of life," a basket of comparable indicators are developed comprising those measures most likely to impact on people's day-to-day lives. In other words, the outcomes-based framework is the starting point for this analysis adapted to suit the needs of the case study countries. It is, of course, the case that the indicators selected here are somewhat subjective in terms of the measures which constitute the quality of people's lives in the three case study countries. Other researchers may select (slightly) different indicators to assess quality of life as a concept. However, three things are clear from adopting a quality of life framework. First, illustrating the use of this approach in practice will promote debate about moving towards outcomes-based accountability, rather than the routine focus on inputs, process, and outputs which has traditionally dominated how governments approach public service provision and reform. Second, "quality of life" as a concept has widened the debate about how governments are performing, well beyond the narrow confines of economic development, towards a bottom-up focus on whether the lives of their citizens are actually improving. Third, benchmarking countries (or indeed regions within countries) will allow for quality of life comparisons which will inevitably drive up performance and allow best practice to evolve and be shared in a context-specific way. In short, this approach promotes comparative policy reforms.

**The indicators**: The indicators selected to illustrate quality of life as a composite measure are set out in Table 1 below and represent those public services most likely to affect people's day-to-day lives: education, health, employment, personal safety, the environment, water, and sanitation. The data were collected from a variety of secondary sources and represent the most up-to-date data available at the time of writing (March 2017). They are listed in no particular order of importance.

Even a cursory examination of these data indicates some interesting comparisons. Consider, for example, some of the large differences in crime rates across the three countries where Kazakhstan performs poorly. On the other hand, look at the large amount of government spending in Kazakhstan on per capita health care compared to Azerbaijan and Georgia. Consider also, Georgia's performance in terms of corruption and civil liberties where they perform extremely well by comparison with Azerbaijan and Kazakhstan. And

**Comparative Policy Reforms, Table 1** Quality of life indicators: comparing the three countries

| Indicators of quality of life | Azerbaijan | Georgia | Kazakhstan |
|---|---|---|---|
| Happiness index (highest score the best) | 5.29 | 4.25 | 5.92 |
| GDP per capita (US $) | 3702 | 3791 | 6472 |
| Homicide rate per 100,000 people | 2.5 | 2.7 | 7.4 |
| Burglary rate per 100,000 | 11.3 | 39.8 | 351.4 |
| Assault rate per 100,000 people | 1.7 | 5.7 | 7.9 |
| Robbery rate per 100,000 people | 2.5 | 11.7 | 110.1 |
| Car theft per 100,000 people | 0.6 | 2.8 | 5.1 |
| Health expenditure as % of GDP | 6.0 | 7.4 | 4.4 |
| Government expenditure on health per capita (US$ per capita) | 91 | 75 | 308 |
| Healthy life expectancy (years) | 63 | 65 | 60 |
| Life expectancy (years) | 70.8 | 74.7 | 71.6 |
| Hospital beds per 1000 people | 4.6 | 2.9 | 7.6 |
| Poverty head count ratio as national poverty line (% of population) | 7.6 | 17.7 | 5.5 |
| Unemployment rate (% of total labor force) | 6.0 | 12.4 | 5.0 |
| GINI index (score of 0 = perfect equality) | 16.64 | 41.58 | 27.42 |
| Poverty headcount ratio at $5 a day (PPP) | 40.35 | 80.55 | 34.72 |
| Adult literacy rate | 99.8 | 99.7 | 99.7 |
| Public spending on education as % of GDP | 2.1 | 2.0 | 3.1 |
| Gross graduation ratio (tertiary education) | 15.4 | 24.9 | 61.4 |
| Out of school rate % (secondary schools) | 12.8 | 6.8 | 0.1 |
| $CO_2$ emissions per capita (metric tons of carbon) | 0.99 | 0.49 | 4.43 |
| Improved sanitation (%) | 89 | 86 | 98 |
| Improved water supply (%) | 87 | 100 | 93 |
| Human development index (1 = most developed) | 0.75 | 0.75 | 0.79 |
| Corruption perceptions rank (lowest = very clean) | 119 | 48 | 123 |
| Civil liberties (1 = highest) | 6 | 3 | 5 |

finally, note Azerbaijan's GINI index score which shows greater income equality across the distribution of income or consumption expenditure than either Georgia or Kazakhstan. This kind of benchmarking exercise should therefore prompt questions about what good practice countries can share with each other in a peer-to-peer learning medium to ultimately raise the quality of life of their citizens as a collective. A higher order of analysis is also possible with these data. For example, an overall quality of life comparison across the three countries could be conducted using the statistical technique one-way between-groups analysis of variance. This would allow a quantitative response to the research question: "Is there a significant difference in the quality of life between citizens living in Azerbaijan, Georgia, and Kazakhstan?" (based on the selected measures above).

These case studies suggest a number of prerequisites or conditions which will allow for the optimization of this comparative policy reforms approach, set out here in no order of importance:

1. Peer-to-peer learning between developing countries is likely to be most successful where there is proximity in their stages of development. There is little point in attempting peer learning when the countries involved are at such different stages of development that reciprocal learning is almost impossible.
2. Even though context is critical, is there sufficient commonality in these measures to achieve consensus on what constitutes "quality of life" in Central Asia and the Caucasus? Although the broad principles are likely to apply – quality of life in most places will be affected by education, health, and housing

services – clearly, the baseline and expectations of progress will be different.

3. It is important that the data which comprise quality of life are robust, valid, and reliable to make the exercise credible. There is little point in devising a quality of life based index on spurious data just to make particular countries look good.
4. It should be recognized that external factors could impact on the quality of people's lives which are outside the control of public service providers. Severe flooding or political unrest could be examples that may not have been predictable and yet it will impact significantly on the quality of people's lives in the affected areas.
5. Critical to this whole process is the willingness of, and support for, interagency working. Where this does not exist, moving to a model which embraces outcomes-based accountability and quality of life indicators will be problematic. There needs to be the political will for this to happen, clearly signaled and enforced.
6. Finally, the response of officials working within public sectors organizations is critical to the success of this model. Street-level bureaucrats are well placed to implement these ideas fully or stymie the approach for their own career interests. Some officials may feel exposed if the data highlight poor performance in their countries or in particular public services and therefore try to discredit the model. Others will see it as a way to enhance their career ambitions and at the same time contribute to an improved quality of life for public service users.

## Conclusions

The case study example set out above offers a framework for comparative policy reforms using the concept of "quality of life" used in three developing countries. The benefit of this approach is sharing of good practice across a wider network of countries on what they need to do in order to improve the quality of life of citizens in their respective countries. It also shifts countries into thinking about outcomes-based accountability rather than inputs and processes, so often the approach taken by governments (in developed and developing countries). In this example, there are no significant differences between the three case study countries, yet there are lessons to be learned. What, for example, can Kazakhstan learn from Georgia and Azerbaijan in terms of crime prevention? Should Georgia be investing more public funding in health care? Is secondary school attendance a problem in Azerbaijan that is feeding into a lower graduation rate in tertiary education, and what can it learn from Georgia and Kazakhstan in this regard? A quality of life framework provides the evidence that allows cross-country learning and ultimately improves the way governments approach the delivery of public services. It attempts to do this mindful of context and may represent a move away from a "one-size-fits-all" model associated with public management reforms which appeared to offer promise but has proved difficult to embed in developing countries. Encouraging an outcomes-based accountability approach, facilitated through peer-to-peer learning, could promote realistic improvements in comparative policy reforms at a pace of development consistent with the growth of emerging economies and mindful of their cultural, political, and historical contexts.

# Comparative Political Elites

Ignacio Arana Araya
Instituto de Ciencia Política, Pontificia Universidad Católica de Chile, Santiago, Chile

## Synonyms

Elites; Latin America; Leadership; Power and politics

## Definition

Political elite members are individuals who influence or make political decisions that have consequences at the national level. *De jure* elite members control the top positions in the three powers of the state, while *de facto* members exercise influence from the shadows, based on their prominent role in society. Political elites vary across countries in their number, recruitment, circulation, integration, and diversity.

## Section

Public Administration and Policy in Latin America.

## Introduction

In 1976, Robert Putnam complained that the comparative study of elites remained overly theoretical, with few studies conducting empirical analyses. Such description is currently untenable. In the last decades, research on comparative elites has observed a notorious increase in the number of studies using longitudinal elite surveys and quantitative techniques to analyze data for different regions. Latin Americanists have followed this trend, forming at least two centers to study elites (http://observatory-elites.org/ and http://americo.usal.es/oir/elites/). The proliferation of studies and increased methodological variety has allowed to test theories and to understand patterns of recruitment, circulation, competition, integration, and policy attitudes in the political elite. Nonetheless, there are still many areas to unearth. We still know little about the influence of de facto elite members in national decision making. We also ignore how internally cohesive (integrated) political elites are, the role of elite members in bureaucracies and the judicial power, how elite members influence the policymaking process, and the relation between the individual differences of elite members and political outcomes.

Researching elites is not an easy task because a good part of their activities are hidden from the public. Nonetheless, it is an area of research that needs to be developed further to understand how democracies work. This entry examines the state--of-the-art in the study of comparative political elites, with a focus on Latin American elites.

## What Are Political Elites?

Burton and Highley (2001: p. 182) define political elites as "the several thousand persons who hold top positions in large or otherwise powerful organizations and movements and who participate in or directly influence national political decision-

making." This definition is uncontroversial: most authors agree that small social groups that concentrate national political decision-making are the backbone of political elites (e.g., Hoffmann-Lange 2007; Putnam 1976).

Political elites have the capacity to dramatically increase and harm the collective well-being of society. They control the three powers of the state and therefore give life and manage the institutions that shape intrastate, state-society, and civic society relations. Political elites decide on the use of the monopoly of force, national economic policies, and the relations with other states. Their messages are so important that they have a profound effect on the beliefs and behavior of average citizens (Jacobs and Shapiro 2000). In fact, for some scholars, elite values and behavior reflect the quality of democracy. Dahl (1973) claimed that democracy becomes possible only once elites have developed patterns of political competition and can form a government without the fear of suffering violence. Relatedly, several studies have found that in democracies elites are more committed to democratic values than the mass public (Sullivan et al. 1993; Stein 1998). In short, like no other group, political elites define the path that a country will follow.

Modern theorists of elites erupted at the turn of the twentieth century, when European elites were being threatened by the rapid expansion of the right to vote, civil rights, modern bureaucracies, and (antioligarchic) socialist ideas. Mosca (1896), Pareto (1900), and Michels (1915) began to systematically analyze how privileged individuals exercise influence in society: who composed the elites? How did they reach a position of power? How could they lose it? Was the elite homogeneous or diverse? These authors coincided in describing societies divided between rulers and the rest. They agreed that political elites tended to be homogenous in customs and values and endogenously perpetuated because their members came from the privileged class. While Mosca normatively proposed that power should be concentrated in a small, capable elite, Pareto and Michels claimed that inevitably in any organization a qualified minority would take the lead.

The assessment of political elites would change by the mid-twentieth century. Among others, Dahl (2005) and Schumpeter (1942/2008) begun to talk about elites in the plural, questioning the validity of descriptions that depicted them as single groups that concentrated political, social, economic, and cultural power. Dahl (2005) described leaders and subleaders within the elites. The latter category included individuals with an unprivileged socio-demographic origin, but whose specialization allowed them to participate in political decision-making.

The pluralist view has prevailed for obvious reasons. Modern democracies are composed of different types of elites. A senator, a cardinal, a businessman, and a renowned writer exercise influence in the political, social, economic, and cultural elites, respectively, and they do not need to interact with each other. Moreover, elites are internally divided. In political elites, different factions are organized mainly through political parties. In fact, Aldrich (1995) defined parties as institutionalized coalitions of elites that aim to capture and use political office.

The study of political elites proliferated since the last quarter of the twentieth century. Scholars have increasingly attempted to address Putnam's critiques, conducting empirical studies and accepting that the political elite has distinctive recruiting and career patterns and that it is composed of a complex and diverse structure of organizations and individuals (Blondel and Müller-Rommel 2007).

A key aspect of elite studies is the extent of the elites' internal differentiation and integration. Elite differentiation alludes to the diversification within the elite regarding number, organization, specialization, and social heterogeneity (Keller 1991). Integration refers to how internally cohesive the political elite is (Putnam 1976, pp. 118–121). In other words, differentiation refers to the proliferation of groups within the elite, while integration refers to how these groups relate to each other. Naturally, both dimensions are interrelated: integration is what keeps political elites together despite increasing diversity and specialization, although it is harder to attain as power is dispersed among diverse groups (Burton and Higley 2001, p. 184).

## How to Study Political Elites?

The first methodological step a researcher needs to make is to decide what type of information she wants to collect about elite members. Scholars may be interested in the social background of elite members, such as their ethnicity, socioeconomic origin, formal education, and religiosity. Researchers may also be interested in studying the trajectories of elite members to uncover patterns of elite circulation and behavior. The path of elite members can reveal who and how enters the political elite, how to succeed (or fail) in it, and the roles performed in such select group. A third type of study that researchers may be interested in is the study of the personality of elite members. Since human beings have stable personality traits that do not vary much over time (Costa and McCrae 1992; Goldberg 1990), researchers may want to examine how the individual differences of elite members explain their behavior.

The controversies start when defining who belongs to the political elite. Burton and Highley (2001: p.182) mention that the political elite is composed of "top business, government, and military leaders, but also top position holders in parties, professional associations, trade unions, media, interest groups, religious, and other powerful and hierarchically structured organizations and sociopolitical movements." Arana (2016) differentiates between *de jure* and *de facto* political elites. *De jure* elite members derive their influence from their legal, formal positions, while *de facto* elite members exercise influence from the shadows, based on their role in society. The first category includes positions such as heads of state, heads of government, ministers, vice ministers, Supreme Court Justices, governors, intendants, Senators, Deputies, party leaders, majors, ambassadors, councilors, and high-profile civil servants. The second category can include businessmen, lobbyists, union leaders, campaign donors, analysts, academics, journalists, and religious, military, and civic society leaders. These categories serve to reduce the number of people in which researchers should focus, but not to identify individual elite members.

Researchers need a strategy to identify who belongs to the political elite. Following Hoffman-Lange (2007), there are three strategies: reputational, decisional, and positional. In the reputational, researchers ask experts to identify elite members. The downside of this approach is that it is onerous and the experts' knowledge and judgment conditions the identification of elite members. The decisional approach identifies elite members through the analysis of documents and interviews that reveal who the decision-makers in relevant areas are. Since this approach does not depend on subjective evaluations, it is less biased than the reputational method. However, it may exclude elite members who do not make decisions in the selected areas, or who informally participate in national decision-making (e.g., entrepreneurs and opinion leaders). The positional approach is the most used to identify political elites (e.g., Higley et al. 1979; Dye 2002). This method recognizes elite members based on the formal positions they hold. A critical weakness of this approach is that it excludes de facto elite members. Arguably, the shortcomings of the positional approach can be corrected combining it with the reputational approach.

Once elite members are identified, there are different methods to study them. One alternative consists of directly interviewing or surveying them. In presidential systems, legislators are by far the most surveyed, with studies spanning countries such as Brazil (McDonough 2014), United States (Lerner et al. 1996), and all of Latin America (the survey conducted in 18 countries by the *Observatorio de Élites Parlamentarias de América Latina*, http://americo.usal.es/oir/elites/). These studies have uncovered relevant data, including the legislators' origin, trajectory, and degree of consensus and dissent among them (Hoffmann-Lange 2007). However, it is often difficult to contact political elite members and, even if contacted, they may be unwilling to answer researchers' requests or answer them insincerely. To avoid these limitations, social scientists have developed quantitative and qualitative methods that allow studying individuals at a distance.

Four methods stand out: psychobiographies, content analysis, historiometry, and expert surveys. Psychobiographers explore the life of prominent people, focusing on certain relevant aspects of the life of their subjects of study to have a deeper understanding of their decisions, motivations, and behavior. The primary technique used by psychobiographers is psychoanalysis. By emphasizing the importance of certain events in the lives of prominent individuals, this method helps to develop hypotheses to explain their behavior. However, the shortcoming is that psychoanalysis is highly subjective and therefore cannot be falsifiable (Elms 1997).

The other three techniques overcome the subjectivity of psychobiographies and other qualitative studies by using statistical tools (Song and Simonton 2007). Content analysis is the analysis of different types of texts (including images and recordings) related to psychological constructs. Students of presidents, for example, have examined their diaries, speeches (Winter and Carlson 1988), and letters (Suedfeld et al. 1986). Historiometric studies test hypotheses of individuals using quantitative methods on historical data. Galton (1869) popularized historiometric studies in what is considered the first social scientific attempt to study geniuses and greatness. There have also been studies centered on American presidents (Simonton 1986). Expert surveys allow gathering information and data from qualified individuals. They are used in different areas, from health issues to investment decisions to military conflict. According to Meyer and Booker (2001), researchers gather expert judgment to (1) provide estimates on new, rare, complex, or poorly understood phenomena; (2) forecast future events; (3) interpret or integrate existing data; (4) learn the processes through which experts solve problems or groups make decisions; and (5) capture the present knowledge of a field. Expert surveys are the most popular technique among those who attempt to assess American presidents (e.g., Arana 2016; Taranto and Leo 2004), and may become the most popular method among political elite researchers. Compared to the alternatives, the measurement advantages of expert surveys are straightforward: they offer high levels of measurement validity and can cover more extensive and updated information at a low cost (Arana 2016).

## Political Elites in Latin America

The study of Latin American political elites was sporadic and unsystematic until the 1980s (an exception is Lipset and Solari 1967), when regime transitions started. Since then, scholars began to examine more methodically the composition and behavior of political elites to understand if those factors could explain successful (or failed) transitions toward democracy (e.g., Higley and Gunther 1992).

Prominent scholars proposed that democratic transitions and breakdowns were the results of elite choices (e.g., O'donnell and Schmitter 1986; López-Pintor 1987). For O'Donnell and Schmitter (1986), the decisions, political skills, and leadership of elite members were as important as the country's level of development, path dependency, and social structure to explain regime change. These authors proposed a turn from dependency theory, dominant in Latin American studies during the 1970s. They started a shift from explanations based on long-term structural forces to analyses centered on the strategic agency of political elites.

However, some scholars disagree with the claim that political elites have significantly changed in the region. Highley and Burton (1989) argued that disunity is the general condition of national elites and that such disunity persists irrespective of socioeconomic development and regime change. That would explain the regime instability and authoritarian setbacks experienced by newly democratized countries. More recently, Rovira (2009) proposed an intermediate position. He claimed that taking into account extended periods of time, there is significant elite circulation in Latin America. Rovira (2009) examined the trajectories of several countries and described processes in which counter-elites that ambitioned to develop new models of society replaced existing elites. As

examples of elite replacement, he mentioned the Mexican Revolution (1910–1920), the emergence of Peronism in Argentina, the 1973 military coup in Chile, and the "Estado Novo" in Brazil (1937–1945) under the Getúlio Vargas dictatorship. Irrespective of the different approaches, most authors agree that political elites have played a key role during the democratizations and authoritarian setbacks experienced in the region since the 1980s.

Once the nascent democracies became more stable, scholars focused on how political elites related to the quality of political representation and democracy (Albala 2016). In the 1990s, there was a proliferation of studies centered on members of Congress. The collective behavior of Latin American legislators became widely researched (e.g., Cox and Morgenstern 2001; Jones 2002; Alemán and Tsevelis 2006). At the individual level, the University of Salamanca's Project of Parliamentary Elites in Latin America (http://americo.usal.es/oir/elites/) has conducted five rounds of interviews with legislators from 18 countries. These publicly available datasets have revealed interesting patterns. For instance, Corral (2011) used them to analyze elite and mass support for democracy in the region, finding a stronger preference for democracy at the elite than at the mass level.

While research centered on legislative behavior continues to grow, recent years have witnessed an increase of studies focused on the executive. Most research has centered on the practice of ministers from different countries, such as Argentina (Camerlo 2014), Brazil (Codato et al. 2014), and Chile (Dávila et al. 2013). Unfortunately, most of these works do not compare ministers across countries. Recently, Arana (2016) conducted a cross-country examination of the individual characteristics of those at the top of the political elite, presidents. He showed that, taken as a group, Latin American presidents tend to come from affluent socioeconomic backgrounds, at least one third are either lawyers or worked in the security forces, and that the leaders tend to score low on agreeableness and neuroticism, moderately high in extroversion and openness to experience, and high in conscientiousness. The next step in this type research is to explore how the individual differences among elite members such as presidents explain their behavior and decision-making.

An important research question among students of political elites is whether privileged individuals represent the societies they rule. Kitschelt (1999) argued that strong ideological commitments between political elites and citizens help to create cycles of political responsiveness and accountability, which leads to policy stability. In contrast, shallow connections between elites and the mass public may incline citizens to be more open to an authoritarian regression (Diamond 1996).

Some scholars have explored the elite-mass public connection. Since the primary mechanism that political elites use to formally organize themselves and represent citizens is political parties (Aldrich 1995), some studies have examined party behavior. Rosas (2005) found that there is significant ideological variation across parties and legislatures in Latin America. For instance, while the Chilean and Mexican legislatures are highly organized along ideological lines, the opposite occurs with their counterparts in Bolivia and Peru. The author also found that the regional ideological variation takes into account political, cultural, and economic dimensions. For example, he found a relevant economic-distributive divide in most legislatures, but not in Brazil, Colombia, the Dominican Republic, and Ecuador. Similarly, Luna and Zeichmeister (2005) found that there are significant differences across regional elites. The authors used elite and mass data to create measures of representation in nine countries and showed that in Chile and Uruguay, party elites accurately represent the preferences of their voters, who have clear policy positions. In contrast, representation is weaker in countries with lower levels of political and socioeconomic development, such as Bolivia and Ecuador. In sum, Rosas (2005) and Luna and Zeichmeister (2005) show that it is hard to make generalizations about Latin American elites. Organized in parties, they have demonstrated a high level of differentiation across countries.

The importance of the elite-mass connection remarks the relevance of the messages and values that regional elites hold. The evidence remains mixed. Corral (2011) found that national elites have a stronger attachment to democracy than the general population. But the work of Stevens et al. (2006) suggests that such elite support may be feeble. They examined the prevalence and consequences of authoritarian attitudes among elites in Argentina, Brazil, Chile, Colombia, Mexico, and Venezuela. Among other things, they found that perceptions of economic threat raise elite levels of authoritarianism. This finding seems problematic in developing nations that periodically have experienced financial crisis, because it makes support for democracy conditional on economic performance.

## Conclusion and Future Agenda

Putnam's (1976) criticism is no longer tenable. The study of political elites has dramatically increased since the 1980s. Latin Americanists have examined the role of regional elites during regime changes, have explored the elite-mass electoral connection, have empirically shown that national elites are ideologically diverse, and that in recent history there have been processes of elite circulation (although this view remains somewhat contested). Over the last few years, scholars have studied individual elite members in the legislature and in the executive with the aim to understand how their characteristics and behavior relate to the quality of political representation and democracy.

Despite the numerous progresses in the study of Latin American political elites, there are still relevant areas that remain unexplored. First and foremost, we still know little about how the de facto political elite influences national decision making. There has been some advances, though. Arana (2012), for example, analyzed how the type of presidential leadership shapes the relationship between ministers and presidential advisors. But we still know little, for instance, about how businessmen, lobbyists, union leaders, and campaign donors influence political decision making.

Second, although we are aware that there is significant elite differentiation across countries, we still know little about elite integration. As aforementioned, the level of cohesiveness within political elites is relevant to understand issues as important as regime stability and elite support for democracy.

Third, studies on the elite members of the executive and legislative powers have not been replicated by examinations of elite members in bureaucracies and the higher echelons of the judiciary (i.e., Constitutional Courts and Supreme Courts). This lack of research is an unfortunate lacuna because regional bureaucracies (and some judicial systems) are highly sensitive to changes in the political elite. Scholars have described Latin American bureaucracies as having low levels of professionalization and stability because they tend to employ servants who are responsive to politicians and special interests (Zuvanic et al. 2010).

Fourth, political elites are responsible for the policymaking process, but much research is pending in this area. Numerous works have explored how the composition of parties, legislatures, and the executive explain policymaking. However, there is little information on how the composition, integration, and diversity of the political elites help to explain policy outcomes. The most prominent work on how politics impacts policy making – *Policymaking in Latin America* (Stein et al. 2008) – analyzes interactions between actions and institutions, but pays little attention to the interactions among actors who influence policymaking.

Finally, researchers have failed to associate the individual differences of elite members to political outcomes. This failure is especially relevant in a region where key members of the elites led the transitions toward democracy, first, and the democratic consolidation, later.

To identify future areas of research is easier than explaining how to expand elite research. The most apparent limitation is that political elites do not want to expose the private, informal relations that connect their members and that are crucial to understand their behavior. However, preceding

research has already shown some techniques to study them (e.g., semi-structured interviews, expert surveys, elite surveys, content analysis, archival analysis, and psychobiographies). The recent proliferation of studies that analyze political elites suggests that, in the short term, researchers will address most of the challenges mentioned.

# Comparative Presidential Systems, Latin America

Luis Bernardo Mejía-Guinand
Faculty of Social Sciences, Department of Political Science, Universidad de los Andes, Bogotá, Cundinamarca, Colombia

## Synonyms

Presidential regime; Presidential republic; Presidential system

## Definition

Presidentialism is a form of government in which, ruled by the Constitution, the President is elected by popular vote for a fixed period of time throughout which he exercises, both as chief of state and chief of government. This system of government establishes a separation of powers among the executive, legislative, and judiciary; however, Latin American Presidents have several legal attributions that grant them primacy vis-à-vis the other powers. In particular, Presidents in Latin America have the power to make laws.

## Characteristics

Latin American presidentialism is characterized by the following. First, the President and Congress are elected in separate timeframes and directly by the primary voters (Congress does not have a relevant role in the election of the President). Second, the time lapse that the President remains in office is fixed. In other words, the President does not require a majority representation in Congress to stay in office. Neither does his time in office ends prematurely because of low popularity rates or adverse political environment in Congress. Third, only under extraordinary circumstances and by means of legal procedures, Congress may bring forward a political

impeachment to the President, who if found guilty, has to leave office before his presidential period is due. Fourth, the President may belong to a political party that is not necessarily the majority party in Congress. In this context, the presidential regime in Latin America can work out both, as a minority government or as a majority government. Fifth, the President is the head of state, the chief of government, and he symbolizes the nation's unity. Under the role of chief of government, Presidents in Latin America have greater attributions to determine public policies and to lead the country's political decisions.

## Origin

After the independence wars of the nineteenth century when the Latin American countries liberated from Spain and Portugal, a republican and presidential regime of government was first adopted. Founders of the newly constituted republics searched for a design of political institutions that departed from a monarchic system, in which hereditary power was the rule. Inspired by the 1787 United States Constitution, Latin American governments adopted certain order and distribution of state functions, whereby the responsibility over each function was trusted to a separate public organism. In this separate-powers design, it was conceived that the legislative and executive were to be directly elected by popular vote in separate elections and for fixed periods. Implicitly, this system was the search for a more legitimate form of government and meant to prevent one branch of power from gaining prevalence over the others.

While it is true that Latin American countries adopted the presidential system of the United States, it is far from true to assume that its development mirrored exactly the American model. Actually, the historic unfolding of this system in the region led to the emergence of distinct institutional features, creating new variants of presidentialism that little resemble the American archetype (Ginsburg et al. 2010).

## Institutional Traits

In Latin America, Presidents play a predominant role in the formulation of public policy and in the definition of the legislative agenda required to implement it. The protagonist role of the President is guaranteed by constitutional legislative prerogatives, nonlegislative faculties and party-powers that either facilitate or restrain the strategic options that Presidents have to unilaterally alter the status quo, block the change in the status quo proposed by another actor, and to create coalitions inside Congress (Mainwaring and Shugart 1997).

### Constitutional Powers

The Constitutional powers granted to the President facilitates that his preferences are taken in consideration when laws are to be approved. In the region, Presidents have the following key attributes: legislative initiative, veto power, capacity to legislate by decree, agenda control, and emergency powers.

#### Legislative Initiative

All Constitutions of Latin American countries grant the President the faculty of legislative initiative. This enables the President to orient the work in Congress in accordance with the executive's priorities and policy objectives. Some of the Constitutions further expand the legislative initiative to all the Cabinet. For example, in Bolivia, Colombia, Costa Rica, El Salvador, Guatemala, Honduras, Panamá, Uruguay, and Venezuela ministers or secretaries of State are authorized to present bills. Furthermore, Constitutions in Colombia, Bolivia, and Venezuela extend this faculty to other public functionaries like the vice-President (Orozco and Zovatto 2009).

In addition, various Latin American Presidents are granted with exclusive legislative initiative in specific public policy areas. In particular, regarding the annual central budget, in countries like Brazil, Colombia, Dominican Republic, El Salvador, Nicaragua, Peru, Uruguay, and Venezuela; once the executive submits the budget to the Congress, the Congress is not entitled to suggest budget increments, but rather only to propose budget

cuts (Duque-Daza 2014). Other areas in which Presidents have legislative initiative in the region include tariffs, fiscal exemptions, and changes to the country's administrative structure.

Legislative initiative gives Presidents an advantage over Congress in the sense that Presidents can prevent undesired changes to status quo, promoted by the legislative, from taking place, simply by not submitting specific issues to debate in Congress.

### Veto Power

Veto is the mechanism by means of which Presidents in Latin America can reject or suggest changes to bills that have been approved by the Legislative. Veto is a powerful mechanism that permits the President to avoid laws he finds inconvenient or counter to its preferred status quo.

All Constitutions in the region grant Presidents the right to veto acts approved by the legislative. This veto takes two forms: total veto and partial veto. The total veto occurs when the Presidents rejects the complete act approved by the Congress; the partial veto takes place when the executive rejects pieces of the approved legislation. In Argentina, Colombia, Costa Rica, Ecuador, México, Nicaragua, Panamá, Paraguay, Peru, Uruguay, and Venezuela, the Constitutions allow Presidents to partially veto a law approved by the legislative (International IDEA 2015). If Congress does not overcome the veto, the legislation at stake does not take effect.

In Latin America, the Constitutions establish two procedures to overcome the presidential veto: absolute majority and qualified majority. The first one states that half plus one votes of members of Congress are needed to bypass the veto. This is the mechanism in place in Brazil, Colombia, Nicaragua, Paraguay, Peru, and Venezuela. Qualified majority, on the other hand, entails that two thirds of votes in Congress are required to surpass the Presidential veto. This is the rule that applies in Argentina, Chile, Costa Rica, El Salvador, Guatemala, Honduras, México, Panamá, and Dominican Republic. Constitutions in Ecuador and Uruguay have other specific procedures to lift the veto. In Ecuador, a qualified majority is required to surpass a total veto while an absolute majority is required to surpass a partial veto. In Uruguay, rules in place are even stricter as three fifth of votes in both chambers are needed to outdo the veto.

### Capacity to Legislate by Decree

This power grants the President with the possibility of directly issuing laws, without the prior involvement of the legislative and therefore the alternative of establishing a new state of affairs aligned with the executive's preferences. In the region, only the Presidents of Argentina and Brazil have the right to enact new laws by decree, in almost any field. However, these decrees are only valid for a limited time frame and Congress may revoke them. In Argentina, Congress has 20 days to state its position regarding a Presidential decree; if objections are not brought forward in this time, the decree automatically become law. In Brazil, legislative decrees that come from the President are valid for 30 days only unless Congress approves them as laws.

Constitutions in Honduras and Peru permit decree powers to their Presidents on economic matters only, while Presidents in Nicaragua and Venezuela have decree faculties on issues dealing with public administration (Orozco and Zovatto 2009).

Constitutions in Argentina, Brazil, Chile, Colombia, and México manifest that Congress is entitled to delegate legislative powers to the President for given periods of time, in specific areas previously defined by the legislative. Finally, all Latin American Constitutions enable Presidents to issue regulatory decrees that facilitate the implementation of Laws approved by the legislative.

### Emergency Powers

A tool that enables the executive to avoid administrative obstacles when needing to resolve exceptional situations derived from an emergency, public hazard, or catastrophe. In such cases, Presidents dictate the necessary legislative measures to deal with the situation. Also under this type of circumstances and with the prior agreement of the cabinet, Presidents are entitled to suspend and/or limit constitutional and civil rights. Emergency powers by the executive are present in all

countries of the region although they are subject to explicit Congress' approval and restricted to a specific time limit.

### Agenda Setting

Presidents in Latin America have yet other two attributes that expand their influence capacity over the legislative. First, is the possibility to request a fast track venue in a given draft bill's transit through Congress. Basically this entails a request to Congress to give priority to specific bills. In Chile, Colombia, Ecuador, Paraguay, Dominican Republic, and Uruguay, Congress has a maximum of 30 days to approve or reject the bill when priority has been requested. Second, is the option that Presidents have to summon Congress to extraordinary sessions to take place outside the Congressional calendar. Constitutions of all Latin American countries allow Presidents to ask for Congress' extraordinary sessions, although in México the Congress Permanent Commission needs to provide its approval.

## Nonlegislative Powers

Presidents in Latin America also have non-legislative faculties granted by the Constitutions which are an important tool to strengthen the effectiveness of the government's policies and to obtain political support from various parties. One of the most important of such faculties is the Presidents´ authority to appoint and dismiss cabinet members without the ratification by Congress. In Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Ecuador, El Salvador, Guatemala, Honduras, México, Nicaragua, Panamá, Paraguay, Dominican Republic, Uruguay, and Venezuela, Presidents have no restrictions to directly appoint and let go their ministers. In Peru although the President has the choice to appoint the Cabinet, he needs Congress to provide clearance.

Therefore, cabinet allocation in Latin American presidential systems becomes a tool for creating legislative and governmental coalitions. Presidents whose political party lack majority representation in Congress may seek support from other political parties by appointing one or more of their affiliates to the Cabinet. Cabinet allocation to political parties other than that of the President will more or less mirror the composition of the coalition parties in Congress (Amorim Neto 2006). In Latin America, when Presidents change the entire cabinet, this does not entail the end of the government or the end of the governing coalition. Changes to the cabinet's composition are a strategy used by Presidents in the region to better manage his relationships with the political environment.

## Partisan Powers

The partisan powers of the President are related to both, the number of seats hold by the President's party or coalition parties in Congress, and to the control the President has over his own party and the parties that make up his coalition.

Throughout part of the Republican life most Latin-America countries fluctuated among two prevailing situations. One, a party system in which the President's party hold majority representation in Congress, allowing him, with relative easiness, to advance his political agenda. The second situation, one in which the President lacked Congressional support making him subject to constant blocking and legislative paralysis. This state of affairs began to change with the return to democracy at the mid-1980s when countries in the region started to develop multiparty systems. For example, in Colombia the enactment of a new Constitution in 1991 opened the political spectrum allowing the emergence of alternative political parties different from the two official parties (conservative and liberal party) that had prevailed up to that stage.

In this same direction, the Party organic Law 18,603 of 1987 issued in Chile, permitted that organizations that had till then opposed clandestinely Pinochet's military rule come out openly and organize themselves as legal political parties. As Chasquetti (2001) highlights, countries that throughout the 1970s had bipartisan models, began evolving by mid-1980s to a moderate multiparty system (Uruguay, Argentina, México, and Venezuela). Other countries like Brazil, Ecuador, Peru, and Bolivia that had reduced their party fragmentation in the 1980s observed an increase of the number of political parties throughout the 1990s.

The coexistence of presidentialism with multiparty systems caught the attention of the academy that pointed out the risks that this combination could bring to democracy's stability. Particularly, the region could confront three problems. First, the possible surge of conflict among branches of government; second, the lack of incentives for the creation of stable coalitions; and third, the overall polarization of the political system (Mainwaring 1993).

Despite this risk, in practice, Presidents in Latin America with minority representation have dedicated efforts towards organizing solid legislative support to better govern, thus seeking the build-up of party coalitions (Lanzaro 2001; Chasquetti 2001). Actually, in Latin American countries with multiparty systems, the tendency to negotiate, cooperate, and to form coalition governments has become widespread (for example, in Chile, Colombia, Brazil, and Uruguay). This entails that the apparent difficult combination of presidentialism with multiparty systems has been attenuated in Latin America through the formation of government coalitions.

## Conclusions

Presidents in Latin America are the chief members of government, whose legitimacy comes from their direct popular election that is independent from the legislative's election. Generally, in Latin America, the President is the main actor in setting the country's public policy agenda. This occurs thanks to the legislative powers that Constitutions grant the President, allowing him great margin of action vis-à-vis the Congress, as well as the authority to appoint the cabinet members. Presidents that have minority representation of their political party in Congress, build coalitions in order to gather the necessary legislative support to enhance their governability.

# Comparative Public Administration and Globalization

Jamil E. Jreisat
School of Public Affairs, University of South Florida, Tampa, FL, USA

## Synonyms

Comparative bureaucratic systems; Comparative global public administration; Comparative organization theory and process; Comparative public management

## Definition

Comparative public administration is an approach to research and development of public administrative attributes and capacity in performing its responsibilities in different political, social, and economic systems.

Globalism is the evolving interconnections among nations of the world and the structures and processes of maintaining and enhancing such linkages in the international system.

## Introduction

Comparative public administration (CPA) is a search for patterns of administrative knowledge and actions worldwide. The global reality that evolved after the breakdown of the colonial order, at the end of WWII, stimulated cross-cultural public administration research and development. The broad interest in the concepts and practices of public administration in various political, economic, and social contexts broke the traditional narrow parochial boundaries of the field of public administration to become a global subject extending to all countries and regions. Early case studies of administrative systems in countries such as China, Thailand, Vietnam, Turkey, Egypt, Pakistan, Brazil, and others disseminated knowledge, enriched practices, and expanded the horizon of public administration to become a global field of theory and practice. Eventually, comparative public administration research enhanced the global knowledge of the vital processes of reforming governance. The following pages articulate and define mutual influences of the comparative cross-cultural administrative studies and the evolving reality of the globalization processes.

## Understanding Globalism

Globalization has been defined in many different ways, but, consistently, it referred to the increasing interconnections among countries. People around the world are more linked to each other than ever before. Information and money flow more rapidly. Goods and services produced in one part of the world are often obtainable in all parts of the world. International travel is more common. International communication is simple and fast. Based on effects, globalization is usually recognized as being driven by a combination of economic, technological, sociocultural, and political factors. The literature regularly refers to the transnational circulation of ideas, languages, or popular culture as stimulated by globalism.

Assessments of effects and explanations of stimulants of globalization vary, depending on what aspect is subject of consideration. Some explanations focus on market forces as the main inducers of globalization. Globalization has been viewed as a creation of the multinational corporate labyrinth, a by-product of the information-scientific-technological revolution, an edifice of the World Bank, or a natural evolution of the production forces in contemporary societies (Farazmand 1999; Thomas 1999). Perhaps, each of these factors and some others have an effect on the process of globalization. What really matters at this time is to be able to appraise and to understand the real consequences of globalization.

Certainly, globalization is a key aspect for the world economic development. Proponents point out that globalization actually brings developmental opportunities and benefits. Developing countries that increased their integration into the world economy over the past few decades attained higher growth in incomes, longer life expectancy, and better education. Many countries like China, India, South Korea, Brazil, and Mexico have adopted domestic strategies and developed institutions that enabled them to take advantage of global markets and, thus, increased the share of trade in their GDP.

In its most positive results, globalization tears down walls and modifies attitudes of nations that are based on suspicion, mutual distrust, and ambition. Globalization has strengthened the nexus and has helped us to know each other's needs in a better way. It has helped to demolish those walls that separate nations and curb human relations and interactions. Globalization has primarily become a fiscal term, but its impact is not limited to the economy of the countries only; the term globalization actually refers to every aspect of life, including cultural, social, psychological, and, of course, political. With the rejection of the colonial relations and designs, globalization made the life of the third world citizens entirely different.

Available information confirms that inequalities in global income and poverty are decreasing

and that globalization has added to this turnaround. Illustrations include China, India, Brazil, and other developing nations in Asia and Latin America where the gap among rich and poor is decreasing. Countries that are becoming poorer are those that are not open to world trade. It is interesting to note that the Global Competitiveness Index, 2013 rankings, published by the World Economic Forum did not include a single African or Latin American country among the top 50 countries. The common belief is that companies moving into a developing country often bring with them higher wages compared with those by domestic companies. Low wages in less developed countries often result in lower levels of education and productivity. Rapid growth and reduction of poverty in some countries have benefited from globalization. In particular, advocates of globalization highlight these advantages:

- Globalization is the rise of market capitalism around the world, which creates jobs, transfers money and investments, and makes products available to consumers as they need them.
- Universal dissemination of scientific and technological inventions such as the *Internet* facilitates and accelerates the processes of global linkages.
- Increasing interdependence among nations promotes collaborative and cooperative relations among countries and governments with benefits to all.

## Contrasting Views of Globalization

Critical views find many deficiencies and shortcomings in the globalization processes and their results. For the critics, globalization is blamed for causing disparity within and among nations, impeding social progress, and even causing unemployment. Although consequences of globalization depend on the particular country, the critics underscore negative effects such as spreading communicable diseases and social deterioration. They claim that developing nations are often abdicating their rule and sovereignty to powerful foreign companies, reviving memories of ancient colonization. Critical perspectives point out other flaws of globalization including:

- Threat of domination by business corporations in some societies because of excessive power invested in them due to globalization. In some developing countries, multinationals have already contributed to labor, environment, and human rights abuses.
- Global capitalism advanced by leaps in technology, failure of communism, and few spectacular economic successes in East Asia but did not benefit everybody. The benefits of information technology have not been widely shared. Statistics in support of this contention indicate that most of the world's *Internet* users live in the industrial countries.
- Poor countries find global capitalism disruptive to their lives and societies. Yet, they have been unable to enact safeguards and regulations to protect their environments and workers as the industrial countries have done decades ago.
- Global capitalism and free trade have not only introduced free commerce in ordinary goods but also stimulated free commerce in money. For small countries, this often resulted in destabilizing their economies and even holding them hostages to whims of financial speculators.
- Current global capitalism perpetuates economic dominance of few industrial regions, owners of the largest global corporations. Dominating the worldwide market, these corporations increase production and provide more access to products only to increase their profits.

At various international conferences, the critics and protesters complained that free trade has to benefit all citizens, not just corporations. Opponents including activists, labor unionists, human rights advocates, and environmentalists protested that globalization has deepened problems. Some critics in urbanized countries have associated loss of jobs with globalization. Multinationals have exported jobs from urbanized countries to developing countries with lower wages. Through trade

freedom, governments have encouraged the replacement of domestically produced goods with goods produced abroad. Some trade unions resist globalization, claiming that it leads to lower wages and encourages trade in goods produced in countries which do not allow unions to defend their workers' rights. In developing countries, critics of globalization point out that in reality they are facing less modernization and more Westernization that is undermining traditional languages and cultures.

Certainly, globalism is not always accurately understood, and its future trends are unpredictable. It is surprising to hear presentations at international conferences in developing countries referring to globalization as the new colonialism by Western countries seeking domination of small and poor countries. Surely, globalization does not affect all countries and peoples the same. Actually, close examination may reveal elements of all the above positive and negative effects, depending where one chooses to look. Regardless, just as capitalism needs a network of governing systems to keep it from devouring societies, globalization requires vigilance in the rule of law. In the United States, many organizations are trusted with validating proper economic conduct and managing a complex market system with appropriate checks to safeguard accountability. Structures entrusted with such responsibilities include the Securities and Exchange Commission, anti-trust laws, labor unions, the Federal Trade Commission, civil society institutions, and others. In comparison, enforcement of global rules is far more complex and much less monitored or scrutinized for proper conduct states.

## Global Structures and Actions

Globalization processes are mainly managed through various institutional structures that continually attempt to ensure a measure of equity in action and foster advancements in various aspects of the global processes. Many institutions have been involved in the difficult task of shaping global policies and influencing rules and standards that have effectively resulted in the construction, approval, and promulgation of various international accords. Most important of these functioning institutions are:

1. United Nations and affiliated special organizations and commissions such as the Food and Agriculture Organization (FAO), International Labour Organization (ILO), World Health Organization (WHO), Atomic Energy Commission, and Human Rights Commission. The UN General Assembly initiates and approves global policies as well as legitimizes recommendations by its specialized structures.
2. Regional associations generating important agreements are another main source for setting international standards. They represent collaboration among large blocks of connected nations such as the European Union (EU), North American Free Trade Agreement (NAFTA), League of Arab States, Association of Southeast Asian Nations (ASEAN), African Union (AU), and Organization of American States (OAS). All have concluded international agreements among their members that endorse certain principles of ethics and recommend actions by each country in its respective domain.
3. Special international structures and forums that have reinforced global interdependence and generated significant balancing of views on critical issues, particularly in world economics and finance, climate control, global ethics, and national security. The World Bank, the International Monetary Fund (IMF), the World Economic Forum, and the Group of 20 (G-20) made significant strides in harmonizing international economic relations and produced important agreements on key global issues.

These international organizations and forums signify a worldwide recognition that many of today's problems and challenges extend beyond the boundaries of one country and, therefore, require collaborative international efforts to manage them. Comparative public administration is fundamentally consistent with the currently unfolding global order. Despite some reservations and criticisms, an international consensus has

been evolving in dealing with certain global principles of ethics, human rights, and collective efforts for relief in facing natural disasters, for examples. Two recent particular illustrations underscore how global efforts are able to produce particular agreements on dealing with specific common problems: One is *ethics*; the second is the *environment*.

1. ***Global Ethics***. Many studies have repeatedly pointed out that corruption in governance is a universal problem. A specific anti-corruption global convention was finalized and approved by the UN General Assembly in 2003, indicating international cooperation in rejecting corruption in its various forms: bribes, fraud, conflict of interest, misuse of information, and similar acts. In December 2003, the UN General Assembly approved the UN Convention Against Corruption, establishing acceptable standards of ethical conduct for the contemporary states of the world in the form of codified rules. The adoption of the Convention was an opportunity for a global response to the problem. The high level of support was demonstrated when 106 countries had already signed the Convention document within 4 months of its adoption by the General Assembly, and over 159 nations signed it within 2 years. The development of global ethics and the ratification of the UN Anti-corruption Convention, committing nations of the world to specific standards of ethics and to specific administrative measures of enforcement, are among the most profound global achievements (Jreisat 2012). Professional management continually seeks to ensure honesty and integrity of public decisions and to broaden perspective on ethics to include issues of transparency, professional responsibility, democratic values, civil liberties, respect of human rights, and compliance with the rule of law.
2. ***Climate Protection***. Another illustration of international agreements and conventions to set binding standards and determine policies is the recent global agreement on protecting the environment. Delegates from 196 nations approved a historic climate deal after 13 days of negotiating in Paris (December 12, 2015). Negotiators from 196 countries approved a landmark climate accord that seeks to dramatically reduce emissions of the greenhouse gases blamed for a dangerous warming of the planet. Mass media worldwide publicized the agreement, adopted after days of intensive bargaining, putting the international community on a course that could fundamentally change the way energy is produced and consumed. The agreement would gradually reduce reliance on fossil fuels in favor of cleaner forms of energy. "History will remember this day. . .The Paris agreement on climate change is a monumental success for the planet and its people," said UN Secretary-General Ban Ki-moon after the pact was signed.

Finally, regardless of different assessments of the global condition, comparative public administration studies have been encouraged and enabled by removing old barriers, developing closer collaboration among academic programs, and what has been commonly referred to as the information technology revolution. Cross-cultural interactions and learning within the current global system are not only possible but easier and more expected than any time in history. The following pages discuss how the comparative public administration approach was stimulated by the growing global linkages and collaborative new international realities.

## Comparative Public Administration

Comparative public administration (CPA) is largely a response to new global realities. It is the study of public institutions, processes, and behaviors worldwide. The end objective of CPA is the discovery of patterns and regularities of administrative action and behavior across cultures in order to refine concepts and improve practices. Global influences expanded the domain of intellectual inquiry in public administration beyond traditional, parochial tendencies. The examination of administrative practices of other societies reveals a wider range of administrative actions,

beyond the horizon of a national experience. Committed to global knowledge, the CPA devoted increasing attention to learning about unfamiliar, non-Western countries and their aspirations to transform and to modernize their administrative systems.

By focusing on patterns of administrative activities, and characteristics of systems performing them, comparative research extends our understanding of factors conducive to successful or unsuccessful administrative performance. Not surprising, therefore, that the comparative approach is inherently concerned with administrative reform and capacity building, globally. Learning about systems of administration and governance through comparative studies is essentially touting the best practices and promoting most desirable organizational structures and processes. Actually, reform plans for improving the performance of public organizations in developing countries have largely been based on lessons learned through cross-cultural comparative investigations.

The current revolution of information technology, introducing communication tools that were not available a few years ago, should make the processes of cross-cultural learning and adaptation easier and more manageable. Public managers worldwide are utilizing new information technologies, training, formal education, and literature to learn from this flow of information about administrative successes and failures. Professional comparative studies provide synthesis of current comparative administrative knowledge and balance the conceptual and the practical concerns of the field. At the end, good governance is not possible without professional public management having the capacity to implement public policies and serve the common good. Cross-cultural administrative research has served global knowledge by overcoming language barriers, increasing empirical data, and developing necessary abilities to surpass many other barriers to effective public management.

For a long time, traditional public administration has been preoccupied with analysis of political institutions in a handful of Western countries (Heady 2001). The recent emergence of many developing countries, and effects of globalization, elevated comparative public administration to be a major tool of global knowledge and understanding, bridging many arbitrary boundaries drawn by the colonial rule, by Western-centered scholarship, and through military conquests.

The comparative perspective assumes that functional patterns of organization and management are definable and transferrable from one system to another. Thus, the comparative search to discover regularities throughout the human experience, irrespective of place and time, is a crucial aspect. As Fred Riggs (1991a) points out, scholars can no longer afford to base their theories on the truly exceptional American experience and to limit comparative public administration to the study of "foreign" governments. Essentially, the processes of generating reliable administrative knowledge and developing trusted administrative principles are inherently comparative. The public administration establishment slowly came to a similar conclusion. Recently, the leading journal in the field, *Public Administration Review*, editorialized (July/August 2016: 533) calling for "Building Global Public Administration Knowledge." Clearly, PAR is recognizing the evolution of the field from a US-centric enterprise to a vibrant global enterprise.

Although comparative administration is not a new endeavor, serious efforts in this approach increased significantly in the post-WWII era. Fred W. Riggs provided intellectual and organizational leadership to the comparative administration group (CAG) during its early days, building on the initiative of the American Society for Public Administration (ASPA) in the early 1960s. The CAG attracted more members and contributed significant writings that set new directions in comparative studies. Other names that have early been prominently involved in the comparative enterprise, and its corollary development administration, include Dwight Waldo, Milton Esman, Ferrel Heady, Frank Sherwood, Ralph Braibanti, John Montgomery, and William Siffin. More recent scholars closely associated with the CPA include A. Farazmand, D. Klingner, G. Bouckaert, C. Pollitt, J. Jreisat, D. Kettl, and others.

In a report to the annual meeting of ASPA, April 1961, Fred Riggs specified three emerging trends in the comparative study of public administration: (1) a trend from normative toward more empirical approaches, (2) a shift from idiographic (distinct cases) toward nomothetic approaches (studies that seek explicitly to formulate and test propositions), and (3) a shift from predominantly non-ecological to an ecological basis of comparative study (Heady and Stokes 1962, p. 2). Over the years, articulation of the CPA priorities regularly included the search for theory and for reforming administrative practices in all countries.

Finally, comparative research expanded understanding of the role of public administration in modern society and augmented appreciation of the importance of relationships between administration and other dimensions of governance, particularly in developing societies. Perhaps, one of the most important contributions of comparative administration is the concentration on building administrative capacities and launching administrative reform, globally. Comparative research got administration out of its narrow ethnocentric perspective into a wider horizon of global scope.

## Development Administration Stimulated by Globalization

With the end of the colonial order, many new nations realized an urgent need to build their administrative capacities and to accelerate implementation of their developmental plans. This started a surge in studies focusing on relevant issues of development administration. In most countries, national development needs required pursuing the goal of administrative reform as they searched for bilateral and multilateral technical assistance. Reform agendas were largely formulated on the basis of information derived from comparative research and investigations of cross-national administrative experiences.

This early and pioneering recognition of global needs guided the CPA approach to greater interest in developmental initiatives. Comparative analysis articulated particular perspectives on global developmental needs that culminated in the specialization of development administration, concentrating on the particular managerial requirements of countries emerging from colonial domination. Development administration underscored vital aspects of effective administration of developmental policies. Issues emphasized included accountability of public management, evaluating results, commitment to development of human resources, and aggressive attacks on corruption with more dependable means such as instituting effective and consistent measures of audit, evaluation, training, and management improvements.

Studies that focused on development administration were helpful in defining problems and challenges facing the practices of developing societies during the post-World War II era. Such emphasis evolved into a special compilation of concepts and applications that became the subfield of "Development Administration." No doubt, knowledge of the administrative problems of developing countries is one of the most important achievements of the comparative movement. Comparative and development administration research and analysis effectively served these objectives: (a) elevated administrative reform to the top of the agenda for action in many countries, (b) recognized the significance of institutions with capacity to act as foundations for developmental policies, and (c) broke out of the traditional parochial mode and gradually developed common shared experiences with global outlook on governance. The early comparative administration concerns attempted to move beyond conventional practices of managing to focus on building administrative capacity and encouraging the creation of instruments that can define and champion improvements of administrative performance. Subsequently, the literature of comparative and development administration were often viewed as entwined as in the *Handbook of Comparative and Development Administration* (edited by A. Farazmand), denoting a special practical and conceptual association.

Another factor stimulated the unfolding of the comparative approach, and the advancing of the developmental aspect, was the narrow focus of

traditional public administration and its preoccupation with administrative practices of Western countries. Development administration, attuned to problems and needs of developing societies, stressed the setting that provides the political, economic, cultural, and historical context within which administration functions. The application of administration varies with the context. Ignoring such contextual linkage brought about many failures of reform projects, just as in body organ transplants, improper adaptation ensured rejection by the recipient system.

The early development administration was a central feature in Fred W. Riggs' pioneering work. In *Administration of Developing Countries*, Riggs chartered new directions for future scholarship in development administration:

> We still lack a clear understanding of the forces which lead to administrative transformations, to changes from traditional, status-oriented bureaucracies to "modern" patterns of governmental organization in which the ideals of "efficiency" and "effectiveness" can become operating principles. . . . Clearly, if we are to progress in our understanding of this subject, to say nothing of our efforts to help governments modernize their administrative systems, we must devote more attention to the conceptual and theoretical basis of our work. (Riggs 1964, p. 3)

To deal with diversity and complexity in the new environments of developing countries, attempts were made to classify these systems into typologies of systems in order to differentiate problems and to facilitate design of appropriate solutions. Administrative systems were analyzed with particular attention to their political, economic, and cultural contexts. Milton Esman's classification scheme is one example that focused on the ability of the emerging countries to create, and effectively deploy, a variety of instruments of action to successfully carry out the burdens of socioeconomic development. Esman's typology consists of five political regime types with significant implications to public administration: (1) conservative oligarchies, (2) authoritarian military reformers, (3) competitive interest-oriented party systems, (4) dominant mass party systems, and (5) Communist totalitarian systems (Esman 1966).

Also, development administration emphasized the processes of institution building as a sure path for developing administrative capacity in the new nations. Building viable, capable, and innovative institutions to lead in development efforts was advocated and promoted in education and training as well as internationally through the efforts of the US Agency for International Development. The institutions that received the endorsement of consultants and financial support by AID include national planning councils or boards, institutes of public administration, development-oriented universities, and research institutes. Foreign consultants followed the trail peddling all sorts of "development-oriented training programs" for public employees in developing countries.

Institution building was an influential framework that appeared to have a great operational promise in the 1960s. It was developed by a consortium of scholars of development from universities of Pittsburgh, Michigan, Indiana, and Syracuse with significant efforts from people like Fred Riggs, Milton Esman, William Siffin, and others. The institution is described and analyzed through three categories of variables (Jreisat 1975):

First, a category that attempts to explain organizational behavior through the examination and measurement of five major variables: leadership, doctrine, program, resources, and structure.

Second, a category of variables deals with linkages or interdependencies that exist between an institution and other relevant parts of the society. They are enabling linkages, functional linkages, normative linkages, and diffused linkages.

Third, the concept of transactions denotes the exchange of goods and services, power, and influence between the institutions and other social organizations that interact with it. The content of these exchanges vary from seeking support to overcoming resistance, exchanging resources to transferring norms and values. As expected, variation takes place in institutional analysis but with high similarity of assumptions and goals, the impact of the institutional

perspective has been considerable. One reason is its operational appeal that attracted the practitioner. Another reason, institutional analysis, received the endorsement of many academicians, consultants, and foreign aid technicians.

Comparative administrative research contributed many other attempts to develop theory and improve practice of the field in diverse contexts. One comparative administration perspective focused on administrative functions related to civil service in all its phases and processes. Civil service systems, as Bekke et al. (1996) point out, play critical roles throughout the world, but our basic knowledge of civil service systems is woefully inadequate. The authors determine that much of theory and empirical research on civil service systems dates from the comparative administration movement of the 1960s. Comparative knowledge about civil service systems attracted little joining or follow-up to the early comparativists' efforts by the rest of the field of public administration.

Integral to the developmental perspectives is the emphasis on transparency of public decisions, performance information, and concern for accountability of public officials and institutions as well as conscious respect of human rights in the work place. Still, lack of conceptual clarity on what is administration and what is development deepened theoretical fragmentation and hindered the cultivation of effective frameworks. In a significant way, diffusion of the subject matter prevented full appreciation of the complexities of development and reduced the scope and value of administrative variables, particularly in the delivery of traditional public services. Scholarly productivity focusing on administrative context (culture, politics, economic development, even history) has not been matched with appropriate knowledge of the inner working of organizations. This is particularly true of organizations operating in developing societies. There has always been insufficient comparative information on organizational and managerial performance of developing countries, their decision-making processes, and their budgetary and civil service reforms. Even harder is to determine who benefitted from public policy outputs and who did not or to ascertain how accountable and equitable administrative actions have been.

At the same time, improvements of relevance and synthesis of comparative studies continue to largely depend on developing generalizations from aggregates of particular facts that have been reliably established without ignoring the concreteness and distinctiveness of the cases being investigated (Jreisat 1997). Part of the problem is that early comparative knowledge was mainly derived from single-case analysis that often served as the empirical base for developing tentative generalizations.

Moreover, contextual analysis brings to the forefront the important relationship between comparative public administration and comparative politics. As indicated above, comparative politics promoted and gave representation to comparative administration in its own early intellectual circles. Subsequently, the organized interest of each group spurred different institutional pursuits that were not always scholarly in nature. Nevertheless, comparative politics concentrates on the political system as if it consists only of political objectives and processes. Comparative administration deals with politics as influence to be reckoned with, but essentially distinct from administration, primarily focused on implementation matters. Administration evolved as an interdisciplinary field with an apparent horizon that extends to financial, technological, sociological, as well as political domains.

The proclivities of traditional management practices, with a hierarchical command and control model, generally suspected of producing rule-driven rigidities and other administrative dysfunctions. These presumed administrative negatives have also been blamed, in part, for causing failures of developmental plans everywhere. In the new global context, performance and accomplishments of objectives are indispensable measures of successful management. A new managerial model and a culture of organizational performance refocused attention on the role of leadership. Thus, reexamination of methods of recruitment and development of skills among administrative and political leaders has become a necessity. More

than "entrepreneurial qualities" is involved here. Realizing that today's leaders operate in a complex and more competitive global environment, emphasis on knowledge, skills, and attitudes has become quite apparent. Also subsumed is a context of democratic norms and employment conditions that subscribe to principles of merit in personnel decisions. Within this context, one finds increasing requirements for managerial competence in areas such as negotiations, mediation, human rights, diversity, equality, and problem-solving techniques.

These challenges indicate that administrative reform is an imperative response to the new societal needs and demands. To accelerate such reform, particularly in developing countries, training and personnel development have been the indispensable prescriptions for closing the gap between current and future – more desirable – conditions. Thus, a variety of training methods have been in use, including education at all levels, training-on-the-job, coaching, mentoring, distance learning, and many other tailor-made training activities. Assessments on the ground in many developing countries, however, indicate that consultant reports and the recommended training have not been sufficient ingredients to bring about the desired transformation.

To fully respond to current global realities, comparative public administration has to overcome some persistent challenging obstacles: One is improving synthesis in its scholarship to overcome theoretical fragmentation. Another is highlighting relevance and utility of research to application. Current global trends are conducive, if not requiring, cross-cultural knowledge and information on all aspects of societies, particularly in public management. To achieve such objectives, research has to emphasize the need for more empirical information, preferably based on comparative analysis of a number of cases. Another track for improvement is through employing appropriate investigation tools such as middle-range concepts that can be verified and ultimately integrated in a meaningful framework. None of these objectives is well served at the present by the preoccupation with abstract global conceptual fiddling.

In sum, globalization processes since the end of WWII stimulated comparative public administration and necessitated the subsequent focus on development management. This comparative and developmental dimension is dramatic, even revolutionary, considering the state of affairs in public administration before. Comparative and development scholarship responded to real needs and transitioned to new territories of inquiry, including the study of international technical assistance, the role of culture, and the centrality of competence and integrity in public management. To serve such expanded function of public management, it grew beyond the narrow traditional disciplinary orientation to become truly interdisciplinary curricula and a genuine profession in practice. No less important among these various shifts of emphasis and trends in research is the greater commitment to public service and concern with equity and satisfaction of citizens. Comparative public administration has faced common issues, unlocked the traditional geographic and research foci, and adapted aptly to recent globalization processes.

## Conclusion

Comparative and development administration have transformed the field of administration to a global one. The comparative approach crossed over the disciplinary restrictions and the particular geographic boundaries to be more inclusive and to highlight the globalization drives that changed the attributes of the modern state. A "global" designation seems especially relevant today given the noncumulative, non-collaborative, and geographically circumscribed qualities of the traditional administrative studies. The transformation of public administration to a global field is vital for serving emerging global concerns to ensure security, peace, economic prosperity, and livelihoods in an increasingly interconnected world. Comparative administration research can provide indispensable contributions to developing countries searching for mastering the essentials of public service delivery, exploring the effects of the politics-administration nexus, and ultimately

solving many of the problems impeding good governance in these societies.

A global public administration scholarship and research can inform contemporary governance and promote transnational knowledge of effective management in various critical functions. Areas such as emergency and crisis management, criminal justice, public performance management, ethics, health and human service administration, protection of human rights, climate change, and the centrality of science and technology are subjects that can be enhanced and improved by exchange of global experiences. A global public administration offers opportunities for clearer understandings of the strengths and weaknesses of administrative systems, processes, and instruments the world over. A more inclusive and robust scholarship can encourage a wider array of solutions for the administrative challenges that hinder prosperity, security, and service provision in any country. A global public administration is an enterprise from which the world at large stands to benefit.

Certainly, the impact of globalization on public administration has been considerable. Globalism altered the context of administration and necessitated reexamination of the ability of public management to innovate and to change, to apply information, and to use new technologies. The political pressures in certain countries favoring downsizing government and privatizing many of its traditional functions are inadequate if not the wrong prescription for dealing with common goals. Policies of recruitment of public managers, development of employees' skills, and retention of competent managerial leadership have acquired different and urgent attention. Pointing out the impact of globalization on public administration, however, is different from assuming that a "new paradigm" is on the way toward a universal application. The emergence of common norms and standards and the global transfer of administrative knowledge remain short of consensus in practice or utilitarian syntheses in concepts.

Recently, increasing global interdependence offered new opportunities for comparative and development public administration to revive its earlier premises and to renew the efforts for change. Today, knowledge regularly crosses cultural boundaries in important areas such as finance, technology, and management. The global economic revolution is in progress and world's political boundaries are giving in to free movement of people, goods, information, ideas, and even cultural values. Effective management is becoming a universal ambition because the global reality requires the contemporary states to increasingly reorganize and build their administrative capacities. Public institutions of current states are continually required to shoulder new and emerging needs and responsibilities. Comparative and development administration have been and will be increasingly in demand to facilitate this movement toward a global public administration that benefits all societies.

# Comparative Public Governance and Management

Edoardo Ongaro
Department of Public Leadership and Social Enterprise (PuLSE), The Open University Business School, The Open University, Milton Keynes, UK

## Synonyms

Comparative governance; Comparative public administration and management; Comparative public management; International public management

## Definition

Comparative public governance and management is the theory and practice of advancing knowledge in public governance and management through the method of comparing across jurisdictions.

## Introduction: The Problem of Comparing Public Governance and Management

Comparative public governance and management is defined by its three key components: "public governance," "public management," and the qualification of "comparative," which indicates a choice of method. These three components can be described as follows.

Public governance is a term which has been defined in various ways. At the heart of the numerous definitions lies the idea of "steering," of providing direction to a political community, or a key subset of it, by activating multiple actors whose

interactions shape the outcomes of collective, purposive social action (Pierre and Peters 2000; Rhodes 1997). It has also been interpreted as a way of reforming public management, an approach characterized by putting a premium on the significance of engaging societal actors into public policy processes and steering policy networks (Kickert et al. 1997; Osborne 2006), seen as more effective than other approaches, criticized as more managerialist and whose main limitation – the advocates of public governance approaches claim – would lie in focusing only on the internal functioning of the public sector. New public governance (Osborne 2006) approaches, at the opposite, emphasize the interface between the public sector and society as the key lever to "make things happen" and achieve effective public policy. It is mainly in this specific sense of an approach to reforming public management by emphasizing the multiple interfaces between public sector organizations and societal formations that the notion of public governance is discussed in this entry.

Public management is a notion interlinked with that of public administration; the relationship between the two may be expressed in the terms of public administration (see entry) and public management representing a different mapping of mostly the same territory. Notably, public management puts emphasis on the issue of the employment of scarce resources for the pursuit of given collective objectives, determined through liberal-democratic procedures in democratic polities. Central concepts in public management are those of efficiency (the ratio of outputs produced to inputs employed), effectiveness (the adequacy of outputs to produce given effects), and sustainability (the long-term viability of the levels of outputs delivered and the ensuing long-term impact on the needs of the community which is served by public services organizations). Systems of public management include public accounting; budgeting, financial management, and auditing; performance management; personnel management; organization and methods. An often studied topic is the reform of public management systems, .i.e., the deliberate attempts to make them, in some sense, work better (Pollitt and Bouckaert 2011).

Finally, the third notion is that of "comparative," a qualification that refers to a method centered on the analysis of similarities and dissimilarities of the same object of study in two different contexts (usually two different jurisdictions), for example, the functioning of a system of performance-related pay of public personnel in two countries. Generally the purpose of comparison is gaining greater insights into the object of investigation, thus augmenting the social-scientific knowledge of it and enabling to "draw lessons" for replication elsewhere (Ragin 1987). So comparative public governance and management concerns the analysis of similarities and dissimilarities in public governance and public management across different jurisdictions.

Comparison is a highly valuable exercise capable of furthering the understanding of how public governance and public management work; in a sense, it is an unavoidable component of the process of knowledge generation, as it is impossible to know in full depth one specific system without comparing it to other systems (comparison can be done explicitly, by empirically comparing two systems, or at least implicitly, by using some stylized model as yardstick, or in the abstract as a mental exercise, usually run through counterfactual arguments).

A key feature is that in comparative analyses, it is "context" that varies. Context is often referred to as the whole bundle of the traits of the politico-administrative system as well as the administrative and the societal culture within which the governance arrangement or public management system which is being studied operates. Comparison may occur at different levels (e.g., at the level of individual public organizations or at the level of the public sector of a country as a whole) and units of analysis (whether the focus is on structures, processes, or actors or a combination thereof). Comparative public management and governance thus is, in a certain sense, the study of the functioning of public management systems and the working of governance arrangements "in context."

The main downside of the comparative method lies in the amount of resources it requires, when contrasted with other methods. Resources come in

different guises: in terms of worktime of researchers required to run a comparative research project; in organizational terms to establish networks of teams of researchers working together across jurisdictions; in financial terms, to carry out the requisite travels and site visits; and crucially in terms of the skills required of the researchers, which should encompass the in-depth knowledge of the governmental systems involved in the comparison and their wider context, besides the knowledge of the specific object of the investigation; last but not least, comparative research requires or is at least highly facilitated by the mastery of more languages – as a minimum of the English language (as the vehicle language in which research work is usually published) plus the relevant language to the context investigated. Comparison may occur within countries sharing important common features (e.g., countries in the Napoleonic administrative tradition: see Ongaro 2009) or across clusters of countries (Pollitt and Bouckaert 2011).

Comparative studies in public governance and management have been on the rise since the last two decades of the twentieth century (Peters 2010; Pollitt 2011). The diffusion of "global" doctrines for reform of the public sector, like the New Public Management, has drawn attention to the differential effects they have had in different countries, hence on contextual influences as an explanation for such variation. Since the 2000s, there has been a flourishing of analyses of contextual influences more and more systematic in their coverage and wide in their scope, at times reaching out to an entire region of the world (e.g., the European continent; see Ongaro and Van Thiel 2017; Verhoest et al. 2012). Achieving such width of coverage is at times facilitated by the way in which the organization of the academic study and the practice of public administration have developed over the last decades (see, e.g., the restructure of the International Institute of Administrative Sciences – an international organization for the development of the administrative sciences – around regional learned societies, with dedicated groups for the study of public administration in, respectively, Europe, Latin America, Asia, and the Middle East and Northern Africa).

Although not exactly the same, terms like "international public management," "comparative public administration and management," or "comparative governance" cover a similar terrain to the one covered by this entry.

C

## Perspectives on Comparative Public Governance and Management: Problems and Paths to Solutions

There appear to be three key problematic areas for the study and the practice of comparative public governance and management. First is methodological problems. These include at least the following three: reliability of data, choice of theory, and the problem of equivalence. The first is the reliability of data for meaningful comparisons, that is, being able to measure the same thing in different contexts. Let's take as an example the measuring of the remuneration and other rewards of civil servants at the top of the government administration, an object of investigation at face value simple to measure; this apparently simple measurement may instead be made highly complicated by a range of differences: in the fiscal regime across countries, so top civil servant may receive different net income even when gross is equal; in the structure of remuneration, for example, what part of the remuneration is fixed and what is variable; in the nature of the statutory arrangements, so civil servants in one country may be easy to dismiss while others may have lifelong tenure and strong protections, which also provide higher certainty to their livelihood, in another one; in the additional perquisites, so civil servants in one country may enjoy benefits their homologues in another country do not; and so forth. The second is the choice of theory and methods with which to conduct comparative analyses, that is, being endowed with the appropriate tools for attributing causality in the investigation of governance arrangements and management systems in different jurisdictions. This is a demanding task, as choice of theory presupposes an understanding of contextual differences across the jurisdictions before the investigation starts, so that the chosen theory may be apt to shed light on

causality links connecting context to the studied object; at the same time, contextual influences may be discovered only as the study unfolds, hence requiring to revisit the choice of theory. There is a circularity here which puts heavy demands on the researchers. The third is the problem of the equivalence of the concepts used: for example, does "corruption" mean the same thing in different countries and cultures? Or, what is comprised within the term "public agency?" For any equivalence of concepts to be meaningfully employed, it is important that the object of the comparative study is clearly specified. The object of comparison may be at the factual level – e.g., the comparison of specific and concrete reform interventions, which may then be further distinguished (e.g., whether the study is of broad national reforms of the public sector, or reforms in specific levels of government, e.g., local government, or policy sectors, e.g. education or healthcare) – or the object of comparison may reside at the conceptual level, for example, the object of investigation could be reform ideologies (New public Management, New Public Governance; Neo-Weberian State: Digital Era Governance); or specific concepts (trust, public value, transparency: so, e.g., the comparative study of the level of trust by the general public in the public sector or the inquiry into the level and modalities whereby disclosure is achieved and hence the functioning of public administration is made more "transparent"); or finally the object of investigation could be discourses and beliefs systems in governance arrangements (Bevir and Rhodes 2006). The two levels – factual and conceptual – cannot be entirely separated and are always to some extent interconnected: "facts" always require concepts to interpret and give meaning to them, and concepts always somehow refer to or are at least partly drawn from empirics (Ongaro 2017), yet some distinction, in order to achieve clarity enough on the object of investigation of the comparative study, is a third demand put on the researchers.

The second set of problems lies in the issue of how theoretically to understand and explain contextual influences. Comparison is in essence understanding how context affects the functioning of the same system in different spatial-temporal circumstances, leading to differential outcomes. The key questions then become: what is context, and how does it "work"? As to the first question, there are very many definitions of "context." What most of them – or at least the most convincing among them – seem to have in common include, first, that context is conceived of as a notion of indefinite extension, the broader set of "features and factors" beyond the immediate environment in which the studied phenomenon is located; second, that context is a notion that goes beyond the idea of a scenery or backdrop to action (context constitutes the possibility for social actors to act); and, third, that context is an inherently multilevel and multidimension concept (a range of definitions and theoretical perspectives on the study of context in public governance and management are reported in the edited volume by Pollitt 2013).

The third cluster of problems is in a sense more practical, and it concerns how to institutionalize practices of lesson-drawing and learning across jurisdictions. In order for comparative public governance and management to be useful, it must be able to set up conditions whereby learning actually occurs, and it is effectively utilized by decision-makers. This raises questions of how to enable learning and of who learns (how to channel knowledge toward decision-makers or, in other words, how to match learning and the making of decisions for reforming) as well as questions of what are the purposes for which learning is utilized (what values are or should be upheld, and what criteria can be used to gauge whether learning has been employed for the bettering, in some sense, of public governance and management, and not for other, less agreeable, purposes, e.g., the self-preservation of rulers in their power).

## Conclusion

Comparative public governance and administration is the study of contextual influences on governance arrangements and public management systems, aimed at generating utilizable

knowledge for the bettering, in some sense, of public governance and management. It has been on the rise over the decade since the 1980s (illustrious predecessors in the field paving the way for the latest developments include Heady (1966) and Riggs (1962)). A key result of comparative public management and governance has lain in debunking the prejudice that "one size fits all" and showing how the same reform doctrines or prescribed recipes for change may produce highly varied outcomes in different contexts, exactly because of the contextual influences at work in different jurisdictions.

# Comparative Public Management Systems

Adeyemi O. Adebayo
University of South Africa, Pretoria, Gauteng, South Africa

## Synonyms

Comparative analysis; Comparative government activities; Comparative public administration; Comparative public governance; Comparative theory and methodology

## Definition

Comparative public management is an aspect of public administration that considers governmental activities in different socioeconomic, political, and cultural settings.

For the purposes of this study, systems connote a set of procedures or principles by which something is done. Thus, taken together, comparative public management systems entail methodology, methods, theoretical perspectives, and\or techniques by which comparative analysis in public management is and can be conducted.

## Introduction

Comparative public management is an aspect of public administration that considers governmental activities in different socioeconomic, political, and cultural settings. Thus, this comparative

public management is an approach to methodology in the field of public management. In this way, comparative public management analysis involves at least two elements. The first relates to the focus on structure and activities of public administration and administrators, and the second is concerned with an examination of organizational structures and administrative behavior (Peters 1994).

Comparative public management as a discipline and practice, and comparative public management as a field of research, have been shaped largely by reforms brought about by movements in public administration as a result of New Public Management [NPM], which emphasizes competition, measurement of results, and outputs; networks and New Public Governance [NPG], with emphasis on collaboration, effectiveness, and a move from outputs to outcomes among other things. These movements also resulted in a shift from public administration as a practice and discipline to public management, which is more applied and practical in nature (Peters 1994: 69; Pollit and Bouckaert 2011: 161–181), for rival arguments. Following these changes, there has been aspiration by nations and observers to know, understand, evaluate, and document the effects of these public sector reforms and the shift from public administration to public management on nations (Ashworth et al. 2013). In this regard, the process of investigating the effects of these reforms, movements, and shift is known as comparative public management.

Public management reform itself entails calculated changes to the structures and processes of public sector organizations with the aim of getting these public sector organizations to, in some way, run better (Pollit and Bouckaert 2011: 2). As such, going by the importance of these reforms as a way of making nations better deliver their mandates, several public management reforms have occurred and have been documented by observers. The first of these reforms started from the late 1950s. These earlier reforms (late 1950s to late 1970s) were mostly national or sectoral reforms, within a nation; thus, these did not come with much fuss because comparative analyses were carried out at individual and organizational levels, that is, micro and meso levels, mostly within a country. However, it was the reforms that started in the 1970s, during the period of global financial crisis, that changed everything (Pollit and Bouckaert 2011). At first, it was NPM, and this lasted from the 1970s to the late 1990s. Then, things began to change again from the late 1990s, and the focus moved from NPM to different kinds of networks that can be grouped under an umbrella name known as NPG. Following these latter reforms (NPM to NPG), the focus changed from national and sectoral to international, and the level of analysis moved from individual and organizations to national bureaucracy, that is, from micro and meso to macro. Hence, comparative analysis in public management became a much-needed and useful analysis tool as nations needed to see what is going on in terms of public sector reforms and management in other nations. The essence of comparison, in its right sense, is not to copy what is happening in other subjects of comparison but to see how others view and tackle similar issues, with the hope of learning from their experience. Consequently, comparative public management is a useful tool in documenting the effects of these reforms on nations. However, it appears comparative public management has not realized the expectations, and optimism scholars and practitioners accorded it at inception. The reason for this is highly connected with issues of methodology, methods, and theories. In this connection, this study argues that quantitative, qualitative, and mixed methods comparative public management analysis is possible and that more quantitative and more mixed research is needed while demonstrating that qualitative analysis can be done without selecting countries for analysis.

This study proceeds by discussing systems in comparative public management. Thereafter, the study demonstrates how a comparative analysis by means of literature review can be done, just before discussing categories and types of public-private partnership [PPP], which is employed in the demonstration. Following these, this study presents the review process adopted. Before it concludes, the outcome of the demonstration

was presented, and avenues for further research were provided.

## Systems in Comparative Public Management

From the above, it was argued that it appears comparative public management have not realized the expectations, and optimism scholars and practitioners accorded it at inception, and the reason for this was linked to issues of methodology, methods, and theories. In this context, following Peters' (1994) observation, comparative public management analysis can be carried out in two broad ways but in four different settings: analyzing public administration itself, analyzing public administrators, analyzing organizational structures, and analyzing administrative behavior. While it is possible to conduct some of these analyses quantitatively, some can only be conducted using qualitative techniques. For example, experimental analysis is possible in analyzing administrative behavior and public administrators, provided the objectives and/or questions posed support this, but not in comparative public administration and organizational structures. It is feasible to argue that quantitative analysis is not in any way possible, following Peters' (1994: 81) observation that comparative analysis questions are boundary and relational questions, such as comparing NPM with NPG and/or public administration, as well as comparing service delivery models under these three models. Nevertheless, it is, however, possible to conduct quantitative comparative analysis especially when the focus is national and/or sectoral and when the unit of analysis is individuals and not organizations, micro not meso. Notwithstanding, quantitative comparative analysis can also be conducted when the focus is international, provided the unit of analysis remains individuals. All the same, organizational and national analysis can be conducted where there are databases that can be used for quantitative analysis. When there are large databases, as with quantitative experimental research that can be done at micro, meso, and macro levels with administrators, quantitative archival analysis is possible using database records.

Up till this point, most comparative public management analyses have been done qualitatively (Pollit and Bouckaert 2011; Rutherford et al. 2017), although there are a few quantitative analyses (Knox 2017). In this context, Peters (1994) rightly submits that comparative analysis questions are relational and boundary questions. On this basis, such questions can only be answered qualitatively. In this way, research attention has been on qualitative analysis. In addition to this is the fact that comparative public management analysis has been limited to selecting particular countries for analysis (Knox 2017). The aftermath of this is that there have been challenges in linking the four areas and three levels (mentioned above) of comparative public management analyses together. Hence, many questions that cannot be answered qualitatively have not been posed. In this connection, O'Toole and Meier (2017) note that there have been recent calls for large-*N* quantitative research. Further, in addition to quantitative and qualitative comparative public management research, mixed methods is also key.

Taken as a whole, quantitative, qualitative, and mixed methods comparative public management analysis is possible. One should, however, bear in mind that this depends largely on the aspect of public management that is being or to be compared. Arguably, as seen in existing studies on comparative public management, the most meaningful comparison is that which exist between or among countries. In this context, particular countries are selected for analysis, and such comparison can focus on public administration, public administrators, organizational structures, and administrative behavior. This appears to be the traditional form of comparative study that is being carried out in the public sector. Hence, most of the research that has been done in this field has been overly some form of descriptive rather than analytical works, describing rather than explaining. However, quantitative, qualitative, and mixed methods comparative public management

analysis can be done without focusing or selecting particular countries for analysis. In the context of qualitative study, as against what is currently obtainable, qualitative comparative analysis can be done through a review of existing literature on a particular aspect of public management, for example, NPG.

While a quantitative study has been carried out (Avellaneda 2017) to demonstrate how experimental-survey research can be carried out in comparative public management, to demonstrate the qualitative system of comparative analysis argued above, one aspect of the latter reform, networks will be used. The reason for the focus on networks is because networks are a midpoint between two important academic debates and organizing models, hierarchies and markets. Thus, while networks are growing in use, theoretical arguments about their superiority compared to markets and hierarchies are also increasing. There are different kinds of networks. In this connection, because of space limitation, it is impossible to illustrate this method by focusing on all networks. Hence, public-private partnership [PPP], which is arguably the most widely used of the available networks in the public sector, will be employed.

The purpose is to demonstrate how the review of literature on PPP can lead to a comparative analysis of how PPP has been utilized in different countries, with the aim of getting public works to be delivered efficiently and effectively, and to account for what public works PPP has been employed. Assumptions are that even though this method, first, does not focus on particular countries, countries are expected to emanate from the review of studies on PPP. Second, categories and types of PPP that these countries have used as a tool in delivering public works are also expected to emanate from patterns in the review, which will be presented in an original elaborative manner.

## Comparative Analysis by Means of Review of Literature

### Background

Following the reforms highlighted above, the mode of delivery of public goods and services changed in many countries. Traditionally before the reforms, especially those from the late 1990s, governments deliver public goods and services through in-house production. However, reforms in the public sector have moved this delivery of public goods and services from traditional delivery to anywhere on a continuum that ranges from traditional design and construct (DC) and design and maintain (DM) to collaborative networks (Alford and O'Flynn 2012). Between these traditional provision methods and collaborative networks lie classical contracting, independent PPP, joint PPP, and other delivery methods (Fig. 1).

These reforms have changed the state dramatically. As a result, the public sector has moved from providers and producers to purchasers and evaluators. These moves have led the public sector to place much reliance on the market either for inputs, to subsidize government production or provision, or for outputs and/or outcomes, as well as direct private sector provision. These have resulted in what Alford and O'Flynn (2012: 249) term "complex constellation of public service provision."

## Categories and Types of Public-Private Partnership

There is no correct or incorrect definition of PPP. The available definitions are subjective and are based on the fit for particular purpose (Hodge and Greve 2010). For the purposes of this study, the definition by Klijn and Teisman (2002) with a little modification will suffice. Klijn and Teisman

**Comparative Public Management Systems, Fig. 1** Continuum of modes of coordination and service delivery (Source: author's own elaboration)

(2002: 137) define PPP as "cooperation between public and private actors with a durable character in which actors develop mutual products and/or services, and in which risk, costs and benefits are shared and/or transferred."

There are different categories and types of PPP. In fact, it is these categories and types that point that not all PPP involves partnership in its ideal sense. For the purposes of this study, PPP will be originally broadly grouped into independent or joint PPP. The independent PPP is concerned with PPP in which the private sector involvement is significant. Here, the private sector often provides the required capital, and the private sector is often responsible for getting proceeds from citizen-users of public goods or services (concessions). Furthermore, the private sector usually retains the property rights, the rights to use, and the management rights, at least until the expiration of the contract, before any decision on renewal is made. The types of PPP under this category are build, own, and operate (BOO); concession; divestiture; partial privatization; and design, build, finance, and operate (DBFO). DBFO is mostly used in the UK PPP/PFI model, where the private sector does almost everything. Independent PPP in the right sense does not constitute partnership per se.

While the private sector is active in the independent PPP, the public sector is more active in the joint PPP category. Even though the joint category of PPP features a more controlled partnership compared with the independent PPP, the word "joint" as used here does not necessarily mean a collaborative form of partnership. In the joint PPP category, both sectors are actively involved in the arrangement, and there is autonomy for each sector to focus on responsibilities in which it has competitive advantage. Here, the private sector may charge end-users directly, but in most cases, payments are based on tax paid by citizens. More often than not, ownership of the property rests with the public sector, but the private sector sometimes retains ownership as well. The types of PPP under this joint category are build, own, operate, and transfer (BOOT); design and operate (DO), design and build (DB); design, build, and maintain (DBM); design, build, and operate (DBO); and build, operate, and transfer (BOT) (Fig. 2).

## The Review Process

In conducting comparative analysis through literature review, the initial step will be the identification of relevant databases where public administration and public management journals are published. In this connection, a title search was conducted on the identified databases: EBSCOhost (Academic Search Premier and Business Source Complete), Emerald, ProQuest (Business Premium Collection), Sage, Taylor and Francis, and Wiley. The search keywords applied to all databases are "Public-Private Partnerships" *OR* "Public Private Partnership" *OR* "Public Private and Partnership case study" *OR* "PPP." The search returned 2240 articles. The search results included articles that contained the words "public," "private," "partnership," and "editorials"; hence, the search returned a high number of articles. Non-PPP articles, non-case study PPP articles, and editorials (1976) were removed. The resulting 264 PPP articles were reviewed. The abstract, introduction, and conclusion of the 264 articles were read in order to determine those that would be relevant for the purposes of the demonstration. Of these 264 articles, 136 of these were not relevant to the study. This resulted in the complete review (subjected to

**Comparative Public Management Systems, Fig. 2** Continuum of PPP categories and types (Source: author's own elaboration)

content/thematic analysis) of only 128 articles, which form the basis of this system demonstration. *Australian Journal of Public Administration*, *International Journal of Public Administration*, *International Journal of Public Sector Management*, *International Review of Administrative Studies*, *Public Administration*, *Public Administration Review*, *Public Money and Management*, *Public Management Review*, and *Public Works Management and Policy* produced the relevant articles on case study PPP.

To derive categories for analysis, a template was made. The columns of the template included "title of article," "year of publication," "author(s)," "theory," "unit of analysis," "objective(s)/research question(s)," "sample (country/where)," "method/data," "type of PPP product(s) or service(s)," "categories of PPP," "types of PPP," "findings and/or conclusions," and "avenues for future research."

## PPP Use for Public Works

In order to understand the analysis below, it makes sense to refer to Grimsey and Lewis' (2004) classification of public works to which PPP can be applied. Grimsey and Lewis (2004: 20–21) offer a distinction between economic and social infrastructure in which PPP can be applied. While social infrastructure is the provision of basic services to households, economic infrastructure provides key intermediate services to business and industry (Grimsey and Lewis 2004). In this connection, Grimsey and Lewis (2004: 20–21) categorized these social and economic infrastructures into hard economic, soft economic, hard social, and soft social.

Following the lines laid down by Grimsey and Lewis (2004: 20–21), it was discovered, following the review, that in the countries of analysis, PPP has been utilized for both social and economic goods and services, though mostly for social infrastructure compared to economic infrastructure and mostly for hard social and hard economic, compared to soft social and soft economic. Road construction accounts for the most economic hard infrastructure for which PPP has been employed, while education accounts for the most social hard infrastructure in which PPP has been utilized. Defense and leisure services and IT services/technology account for the most social soft and economic soft infrastructure for which PPP has been employed, respectively. In the delivery of these public infrastructures, the design, build finance, and operate (DBFO) and concession models were mostly used, followed by BOOT and then BOT and followed by BOO. DBM/DBO, BOO, and DO are on the same level of use and are the least used PPP types (Table 1).

## PPP Use by Country

One of the most important aspects of comparative analysis is ensuring that like items are compared. However, because countries emanated from the literature reviewed, here, though it is possible to group countries using criteria such as size and population, countries are grouped according to how significantly they have utilized PPP, holding other criteria like size and population of country constant. The reason for this is that it appears this is arguably a good way by which a meaningful analysis can be done here. In the category of extremely heavy users of PPP are Australia and the UK. In Australia both independent and joint PPP categories have been used (Johnston 2010). Like Australia, the UK has extensively utilized joint and independent PPP. In doing so, both Australia and the UK utilized all the types of PPP under the independent and joint categories. However, DBFO, which is more of private finance than partnership, is the most employed type of PPP in the UK (Acerete et al. 2010). Thus, Australia and the UK are on the same level when it comes to the use of PPP for the provision of public goods and services.

Hong Kong, Ireland, Malaysia, and Russia constitute heavy users of PPP. In Hong Kong, PPP has been used for more of social than economic infrastructure (Higgins and Huque 2015). In Russia, PPP has been utilized for transportation, water supply and purification, refuse recycling plant and tourism, employing concession, BOO, and DBFO which are sheer forms of

**Comparative Public Management Systems, Table 1** PPP use by countries, resulting PPP infrastructure and type of arrangement

| | Types of infrastructure | | | | Categories of PPP | | | | | | | |

Source: Author's own elaboration

private finance models (Acerete et al. 2010; Hodge and Greve 2010). In Malaysia, PPP has been employed in the delivery of roads, ports, airports, power, water supply, sewage, and rail in BOOT and BOT forms which are mainly under the joint category of PPP in which the public sector is more active. Ireland's use of PPP has been in the area of education, public transport, roads, and solid waste (Reeves and Ryan 2007). The models adopted by the Irish government are DBFO, concession, and BOOT, which is a mix of joint and independent but more of joint.

Furthermore, India has used PPP for health services and roads in DBFO and BOT arrangements (Acerete et al. 2010; Gopalkrishna and Karnam 2015). Kazakhstan has also used PPP for transportation and in the energy sector employing concession, BOO, and DBFO models, mainly to take advantage of private finance. In Spain, PPP has been employed for roads and schools in DBFO and concession models mainly to take advantage of private finance as in Kazakhstan (Carpintero and Siemiatycki 2015). In the USA, PPP has been used for roads, sewer construction, waste water treatment, and correctional facilities in the form of DBFO arrangement. India, Kazakhstan, Spain, and the USA are mild users of PPP. What is common among the mild users is that they all used the independent category of PPP. A reason for this is arguably to take advantage of private finance.

The light users of PPP are Belgium, Canada, Italy, and the Netherlands. In Belgium, PPP has been used in the education sector for the design, development, financing, and operating of schools (Van Gestel et al. 2014). Canada has utilized PPP for urban transit, in a concession model (Siemiatycki and Friedman 2012). The Netherlands has used PPP in the area of urban development, employing BOOT model (Klijn and Teisman 2002). Belgium, Canada, and the Netherlands have only utilized PPP to a minimal extent. In Italy, PPP has been employed only for health services. The surprising observation is that in doing so, all the types of PPP under both independent and joint arrangements were fully employed in Italy (Vecchi et al. 2010). Further, in contrast with other countries, Italy also employed the concession approach, whereby end-users are charged for the goods and/or services provided, for health care (Table 2).

## Discussion/Summary

In Belgium, Canada, India, Ireland, Kazakhstan, Russia, Spain, and the USA, only the independent model of PPP has been used. These counties account for 8 out of the 14 countries that emerged from the analysis. Other countries used a combination of independent and joint categories of PPP. On this basis, DBFO and concession, which are forms of private sector finance, were mostly used by countries. In this connection, it can be argued, alongside Acerete et al. (2010) and Hodge and Greve (2010) that, in addition to reforms that led to shifts in public management and public service delivery, most countries engage in PPP in order to take advantage of private finance.

## Further Research

There are avenues for quantitative, qualitative, and mixed methods comparative analysis in public management. Further studies can be conducted using the method demonstrated here. Further, future studies can replicate this method by focusing on other aspects of networks or other aspects of public sector reforms as a whole. However, the main focus should be on other aspects of comparative public management where other questions aside boundary and relational questions can be posed so as to take advantage of other methodologies and methods available to researchers, aside qualitative methods. In this way, it will be possible to have a balance between qualitative, quantitative, and mixed methods. This will ensure that comparative analyses in public management and in the public sector as a whole will not be limited to qualitative methods and methodology.

## Conclusion

This study has provided an overview of comparative public management and comparative

C

management systems. In doing so, the study touched on methods and methodology in comparative public management. This study argues that quantitative, qualitative, and mixed methods research is possible in comparative public management studies. Thereafter, a comparative analysis was conducted to demonstrate that comparative analysis is possible without focusing on countries for analysis at the initial stage as is the tradition in most comparative public management studies. This study began by defining comparative public management, systems, and comparative public management systems and, thereafter, establishing reforms that led to movements in public management and that resulted in a shift from public administration to public management. Following this, a network was identified as one of the aftermath of the latter reform, and PPP, a type of network, was employed in demonstrating one of this study's arguments. Finally, the outcome of the analysis was discussed, before providing avenues for future research.

# Comparative Public Performance Management Systems

Angela Kline and Maria P. Aristigueta
University of Delaware, Newark, DE, USA

## Synonyms

Managing for results; Performance frameworks; Performance measurement systems

## Definition

The structures and processes by which an organization collects information to assess the results of its activities.

## Introduction

To appropriately compare systems of performance management, it is necessary to consider the system in which performance is being defined, quantified, and tracked long-term. This article is organized as a review of the foremost performance management systems based on public administrative reform eras from the last half-century. This framework was selected because understanding purpose and context are important for understanding measurement systems (Behn 2003). Also, the inherent connection between performance management and public management reform cannot be overlooked. Each section will review performance management systems from the following periods (Table 1).

**Comparative Public Performance Management Systems, Table 1** Performance management eras

| Name | Era | Characteristics of dominant discourse |
|---|---|---|
| Scientific management | Prewar into 1960s | Rational and hierarchical planning. Science and expertise will produce progress |
| New public management | Late 1970s to late 1990s | Business techniques to improve efficiency. Rise of "better management" as the solution to a wide range of problems |
| Governance era | 1990–2010 | Make government more effective and legitimate by including a wider range of social actors in both policymaking and implementation. Some varieties of governance explicitly rest on a "network approach" and most of them emphasize "horizontality" over vertical controls |

Adapted from Pollitt and Bouckaert (2011), p. 13, 22

## Performance Measurement to Management

Performance measurement focuses "on specific government activities, inform management decisions, and enable the public and policy makers to hold agencies accountable for program efficiency and effectiveness" (Aristigueta et al. 2001, p. 255). Performance management includes these measures into the systems that administer an organization. "Performance management is the incorporation and use of performance information in decision-making" (Van Dooren et al. 2010, p. 32).

Among the dialogues in the performance literature are the differing orientations of performance as a process or tool and performance as the

realization of public values (Van Dooren et al. 2010). A traditional lens approaches performance measurement as the regular measurement of outcomes through measures of effectiveness and efficiency of the program or service under review (Hatry 2006). More recently, Poister et al. (2015) define performance measurement as "the systematic, orderly collection of quantitative data along a set of key indicators of organizational (or program) performance" (p. 7) and advocate for the advancement to performance management. Poister et al. expand the definition to "performance management is the collection and purposive use of quantitative performance information to support management decisions that advance the accomplishment of organizational (or program) strategic goals" (2015, p. 7).

The realization of public values in performance management requires considering the question, "what are the defining characteristics of performance?" (Van Dooren et al. 2010, p. 22). The latter approach advances a performance management system that considers the values of those affected by the program or service being measured. Additionally, infusing the process with the consideration of values may prevent or decrease the likelihood that efficiency and effectiveness will not trump other values of equity and diversity (Wholey 2002).

## Challenges of Performance Management

Despite the potential benefits of performance management, practitioners and scholars alike highlight the challenges of implementation in a public organization. At the beginning of this process, managers, staff, and stakeholders may have differing opinions on the appropriate goals and strategies which may require hard choices for the direction of the organization (Wholey 2002). Even once strategies and measures are agreed upon, there may be ambiguity regarding how managers can include performance results into the decision-making process. An additional challenge of implementing performance management systems is the measurability of the activity under review. Organizations whose missions are advocacy or prevention-based find it challenging to measure the results of its work (Poister 2003). Principal among these challenges are finding the resources – staff time, cost of data collection and analysis, organizational costs – that are required for implementing a performance management system (Wholey 2002).

## Importance of Performance Management

Understanding the importance of performance management in the public sector is a critical first step in classifying and analyzing performance management systems. Consistent performance data requires sustained investment of resources from the organization. Performance results can inform numerous management functions and improve operations of an organization. Performance information is vital for strategic planning, monitoring and reporting program activities, budgeting and financial management, among many others (Poister 2003). As well as being useful for an organization's internal functions, performance information is necessary for organizations to manage external contracts and obtain grant funds. In essence, a robust performance measurement system can enhance an organization's ability to attract and retain external funding streams.

However, the aforementioned benefits of performance measures require an organization to integrate these data into their management systems. The performance management systems reviewed below provide a comparison of these systems based on administrative reform from the scientific management era, new public management era, and the governance era.

## Scientific Management

Scientific management thrived during the pre-World War II years in the United States. In the interest of greater efficiency, Taylor developed the theory of scientific management as a true science,

"resting upon clearly defined laws, rules, and principles, as a foundation" (1914, p. 7). Initially conceived as principles for application in a manufacturing environment, Taylor proposed that the theory of scientific management could be applied to various kinds of human activity (1914). Scientific management advised managers to gain efficiency "by setting production quotas linked to individualized payment systems" (Hood 2007, p. 98). When applied to the public sector, scientific management divides bosses and employees, those who manage and those who work (Lynn Jr 2001). According to Kettl, "advocates of the scientific management approach to public administration saw virtually no barrier to its ability to improve government – if only government administrators could be protected from political meddling" (2000, p. 9).

### Cost-Benefit Analysis

The Cost-Benefit Analysis (CBA) gained prevalence during the scientific management era. Originally developed for evaluating water-resource projects in the 1930s (Nash et al. 1975), public administrators considered CBA a tool for increasing efficiency of public organizations. While many administrators of this era viewed CBA as an objective tool for measuring efficiency, scholars highlight that CBA is subject to the analyst's value judgments of selecting the criteria for the model (Nash et al. 1975). CBA in the public sector is defined as Net Benefits = Total Benefits – Total Cost. Analyzing a social program with a CBA requires taking "into account the costs and benefits – whether monetary or nonmonetary – that accrue to everyone in society" (Cellini and Kee 2010, p. 494). While the equation for CBA is simple, estimating complex social costs is speculative and often inaccurate (Cellini and Kee 2010). The results of a CBA deem a program as successful if the social benefits exceed the social costs (McDavid et al. 2013.) It is more commonly used in assessing environmental or infrastructure studies than the assessment of social programs (McDavid et al. 2013).

CBA may work best on analysis of a single program or policy. Critics of public-sector use of CBA state that "it is often difficult to place dollar values on all (or most) costs and benefits" and describe the process as "difficult and time consuming" (Cellini and Kee 2010, p. 496). Cost-effectiveness (CEA) is also a useful tool that relates the costs of a program to its outcomes. The units of "effectiveness is simply a measure of any quantifiable outcome central to the program's objectives" (Cellini and Kee 2010, p. 494). Like CBA, CEA typically focuses on one primary outcome (for example, lives saved or drop-out prevention), though the decision may be made to compute cost-effectiveness ratios for additional outcomes of interest.

### Total Quality Management

Total Quality Management (TQM) is a framework that was also adapted for public administration from the private sector. Ehrenberg and Stupak define TQM as a "management philosophy that focuses on fulfilling customer expectations by providing quality services and products as a result of continuous improvement to the organizational process" (1994, p. 79). Developed by Deming and later expanded by Juran, the architects of TQM both were influenced greatly by visiting Japan and learning from their manufacturing processes. Kaizen is a Japanese word incorporated into TQM and represents continuous, unending improvement (Ehrenberg and Stupak 1994).

Many scholars have further developed the TQM philosophy, but Ehrenberg and Stupak summarize the following components:

1. Use of quantitative measures to improve processes continuously
2. Focus on providing quality services that meet customer-defined expectations
3. Empowerment of individuals to improve processes and assume accountability for products and services
4. Decisions based on facts
5. A commitment from top management to change the culture and embrace the TQM philosophy. (1994, p. 81)

The goal of TQM is that it will result in significant change of an organization's culture, leadership, structure, and design process.

Negative aspects of TQM include issues with employee motivation and employee participation. Connor explains that TQM does not place sufficient emphasis on morale and employee motivation because it strives for efficiency by any means (1997). Connor states that purging an organization of personnel breaks the implicit contract vital for the public sector; "loyalty is the glue that holds government organizations together. Once lost, it is not easily restored" (1997, p. 506). Furthermore, TQM's focus on feedback without employee empowerment may lead to trivial or phony employee participation (Connor 1997).

## New Public Management

Scholars have written volumes on the topic of new public management. The following section will provide a brief summary of new public management and review three tools that align with the principles of new public management: the Balanced Scorecard, Logic Models, and Lean Six Sigma.

With the benefit of historical perspective, New Public Management (NPM) is a divisive topic among many modern public administration scholars. However, NPM advocates in the late 1970s through the early 1990s trusted NPM's promise of government reform. As Moynihan points out, NPM is not a concise theory, rather the doctrine of NPM is a set of premises about the functions of government (2006). The main tenant of NPM is that government should adopt a business-like approach where service delivery is enhanced through competition in the marketplace. Then, government would be able to hold service providers accountable, public or private entities, for the provision of goods and services based on the outputs and outcomes (Osborne 1993). NPM's themes are disaggregation, competition, and incentivization (Dunleavy et al. 2005). The birth of the NPM movement is attributed to the Thatcher administration in the UK and the Reagan administration in the US although the term "reinventing government" was more commonly used in the US (Pollitt and Bouckaert 2011). Reinventing government was coined by Osborne and Gaebler who helped to grow the philosophy under the Clinton administration with then Vice President Al Gore and inspired the Government Performance and Results Act of 1993 (GPRA) (Pollitt and Bouckaert 2011). Because NPM endured for decades beyond party lines, the movement evolved and developed different spokes of the reform wheel.

### Logic Models

Perhaps the most well-known tool used for measuring performance, logic models grew in prevalence during the 1990s by United Way. Other names for logic models include Chains of Reasoning, Theory of Action, and Performance Framework (McLaughlin and Jordan 1999). Demonstrated in Fig. 1, a logic model enables administrators to plan and evaluate results of a program.

A logic model enables managers to ask a series of if-then questions about the program and develop an appropriate level of detail for each component. McLaughlin and Jordan explain the hypothesis of a logic model as "If assumptions about contextual factors remain correct and the program uses these resources with these activities, then it will produce these short-term outcomes for identified customers who will use them, leading to longer term outcomes" (1999, p. 70).

Administrators developing a logic model must quantify performance indicators of a program's inputs, outputs, outcomes, intermediate outcomes, and end or long-term outcomes (Hatry 2006). An additional component of the logic model is the context in which the program is operating. The key contextual factors are external to the program and administrators may not be able to affect change in this area (McLaughlin and Jordan 1999). While a logic model is a practical tool, it is not without its limitations. Staff requires ongoing training and organizational support to sustain evaluative efforts and there may be limited guidance for managers to incorporate the outcomes into decision making processes (Hendricks et al. 2008). Because changes in social services take years, if not decades, it may be challenging for an organization to maintain contact with clients who received goods and services

**Comparative Public Performance Management Systems, Fig. 1** Logic model (McLaughlin and Jordan 2010, p. 57)

to document a program's end or long-term outcomes.

## Balanced Scorecard

Introduced by Kaplan and Norton in 1992, the Balanced Scorecard was designed for use in the private sector to assess more than traditional financial measures to incorporate several dimensions of performance (Poister 2003). The Balanced Scorecard aims to include performance from customer perspectives, internal business perspective, the innovation and learning perspective and the financial perspective (Poister 2003). Most importantly, advocates of the Balanced Scorecard aspire to measure and track "intangible assets in value creation" (Niven 2008, p. 3). The Balanced Scorecard is a different tool to provide a more nuanced perspective on an organization's performance. Kaplan and Norton liken the Balanced Scorecard to the instrument panel in an airplane; pilots need information from a variety of tool to safely operate the plane (1992). Similarly, the Balanced Scorecard encourages managers to ask the following questions:

- How do customers see us? (customer perspective)
- What must we excel at? (internal perspective)
- Can we continue to improve and create value? (innovation and learning perspective)
- How do we look to shareholders? (financial perspective). (Kaplan and Norton 1992, p. 72)

After identifying answers to these questions in the framework, managers identify goals and measures for each perspective. For example, if a goal from the financial perspective is to survive, then an appropriate measure is cash flow (Kaplan and Norton 1992). In 2008, it was estimated that 60% of Fortune 1000 companies use the Balanced Scorecard system (Niven 2008).

Given the Balanced Scorecard's popularity and ability to incorporate complexity, the public sector adapted the framework for government and nonprofit agencies (Fig. 2).

The Balanced Scorecard is simultaneously described as a measurement system, communication tool, and strategic management system because of the interconnectedness of these functions in an organization (Niven 2008). The public sector Balanced Scorecard assesses the strategy of the four domains of the organization, but considers the core purpose for existing. The importance of fulfilling the mission is a key distinction in the nonprofit Balanced Scorecard.

Criticisms of the Balanced Scorecard include the template's lack of flexibility and its equal weighting of an organization's financial, customer, internal, and employee learning and growth components. This framework assumes

**Comparative Public Performance Management Systems, Fig. 2** Niven's balanced scorecard (Niven 2008, p. 32)

that all organizations share the characteristics of the four functional areas (McDavid et al. 2013).

### Lean Six Sigma

There is strong debate in the public administration dialogues on the applicability of Lean Six Sigma principles in the public sector (Radnor and Boaden 2008). Lean Six Sigma falls under the umbrella of continuous improvement frameworks and it is "an approach focused on improving quality, reducing variation and eliminating waste in an organization" (Furterer and Elshennawy 2005, p. 1179). Six Sigma and Lean were developed independently in the 1970s–1980s, but its complimentary nature resulted in a merged framework since the 1990s. Created by Motorola, Six Sigma is "both a quality management philosophy and a methodology that focuses on reducing variation, measuring defects and improving the quality of products, processes and services" (Furterer and Elshennawy 2005, p. 1179). Lean was developed by Toyota Motor Corporation as a "methodology that focuses on reducing cycle time and waste in processes" (Furterer and Elshennawy 2005, p. 1179). Examples of local governments that adopt Lean Six Sigma include improving financial processes like payroll and purchasing functions (Furterer and Elshennawy 2005).

There are numerous challenges with adapting Lean Six Sigma for use in the public sector. An inherent weakness of Lean Six Sigma is the use of manufacturing terminology in other sectors (Antony et al. 2012). Other criticisms of Lean Six Sigma include its fragmented approach of trying to solve problems without considering a systems perspective (Antony et al. 2012).

## Governance Era

Scholars posit that there is no dominant model of the late 1990s–2010; Pollitt and Bouckaert concedes that despite the lack of a dominant model there are key concepts that align with this era (2011). Prevalent concepts during the 1990s–2010 include governance, networks, partnerships, transparency, and trust (Pollitt and Bouckaert 2011). Further explained as the Governance Era, it is characterized by making "government more effective and more legitimate by

including a wider range of social actors in both policy making and implementation" (Pollitt and Bouckaert 2011, p. 22).

Aristigueta and Stanica (forthcoming) identify good governance indicators as a precursor to new public governance. The next section will discuss requirements for good governance as a precursor to new public governance.

### Good Governance

Analysis conducted by Van Doeveren (2011) identified five common principles of good governance present in multiple definitions of the concept: accountability, efficiency and effectiveness, openness and transparency, participation, and the rule of law. Studying the body of literature that defines the concept, a first set of definitions views good governance as based on transparency, accountability, rule of law, regulatory form, and efficiency. Institutions that subscribe to this definition include economic and public sector management institutions like the World Bank, International Monetary Fund (IMF), and the Department for International Development (DFID). The second set of definitions highlights the democratic and human rights dimensions of governance; advocates of this approach are institutions like the United Nations (UN) and the United States Agency for International Development (USAID).

Moreover, institutions like the United Nations Development Program (UNDP), IMF, DFID, and the United Nations Economic and Social Commission for Asia and the Pacific sees these definitions as being focused on normative values and public policy objectives that are seen to be socially desirable (Hyden et al. 2004; Kaufmann 2000). Yet, another classification associates good governance with legitimate governance, therefore institutions like USAID and UNDP highlight the important role of civil society and actor networks in participative and effective governance processes (Hewitt de Alcántara 1998). These two categories define good governance as an analytical concept that shows how decisions are made, and a prescriptive concept (a list of common principles) that states the values that are considered important for political decision-making processes in developing countries (Van Doeveren 2011).

## New Public Governance

New Public Governance derives from organizational sociology and network theory and suggests "both a plural state, where multiple interdependent actors contribute to the delivery of public services, and a pluralist state, where multiple processes inform the policy making system" (Osborne 2006, p. 384). New Public Governance has been identified as the solution to complexities of government and to providing a variety of beneficial practices to expand capacity for delivery of public services. Governments in the twenty-first century require problem-solving capacity that can no longer be delivered by just one entity (Rittel and Webber 1973; Head 2008). Furthermore, the rise of New Public Governance is believed to address the need to promote values that are oriented towards democracy and efficiency. For example in studying New Public Governance in the United States, Morgan and Cook (2014) suggest the need to pay particular attention to the institutions of civil society and to "the very fabric from which institutions emerge" (p. 322). Because the characteristics of the Governance Era and new public governance are flexible there is no single dominant performance management system.

As these are emerging frameworks, there is active scholarship occurring to determine best practices for establishing a performance management system in the era of new public governance. The following section will discuss the genesis of two systems that may offer solutions for the next generation of administrators.

A nascent topic among scholars is the use of dynamic performance management (DPM). DPM asserts an understanding that the complexity of modern service delivery in addressing wicked problems requires a nuanced and time-bound performance tool. Whereas a traditional view of performance management has a simplified outcomes-based perspective, Bianchi et al. posit that the complexity of wicked problems requires administrators to balance the three challenges of improving service quality, improving quality-of-life outcomes, and improving conformity to the principles of

public governance (2017). Bianchi et al. state that DPM "not only focuses on the perspective of a single organization but also on the perspective of the relevant system which generates the observed problem behavior, including the achievement of public governance principles" (p. 3, 2017). A DPM perspective appreciates the "nonlinear feedback relationships" among actors involved in the systems under review (Bianchi et al. 2017, p. 3). As such, DPM is appropriate where "policy development needs to accept the important roles of emergent strategy and learning mechanisms, rather than attempting 'blueprint' strategic planning and control mechanisms" (Bianchi et al. 2017, p. 1). This is a growing topic and additional research is needed to develop best practices for implementation.

Due to DPM's balancing act of considering stakeholders' perspectives, coproduction is often discussed concurrently with DPM. Bovaird and Loeffler define coproduction as "professionals and citizens making better use of each other's assets, resources and contributions to achieve better outcomes or improved efficiency" (2016, p. 254). Coproduction is a natural extension of new public governance because it assumes the shared responsibility of a task across stakeholder groups. This process of coproduction regards the role of government as "not simply to regulate, distribute or redistribute public benefits but to serve as a catalytic agent to invest private and nonprofit stakeholders in shared ownership of the public good" (Bao et al. 2012, p. 447).

The importance of public values in the aforementioned models differs from previous eras' performance management philosophy which weights efficiency and effectiveness above all else. Bao et al. point out, "unlike traditional performance management where simple goals and a system of hierarchy suffice, a value-centered approach requires public managers to put the values of the polity, a project, or an initiative at the center" (2012, p. 457).

Among the benefits of a value-centered approach to performance management is that it highlights the public process to achieve results and it does not reflect the "finding fault" evaluative process common under NPM systems (Bao et al. 2012, p. 459). Scholars underscore the significance of developing coproduction strategies to rebuild citizens' trust in government (Fledderus et al. 2014; Kettl 2015). While technology has expanded the government's ability to track performance, it has also greatly enhanced the public's ability to participate in public processes. Open Government, as a movement, started in 2009 with then President Obama's Memorandum on Transparency and Open Government which led to greater transparency, participation, and collaboration (Veljkovic et al. 2014). Veljkovic et al. summarize the five principles of open government:

- Opening public sector information data and enabling citizens and entrepreneurs to access government – held data in a uniform way (data transparency)
- Opening government processes and operations to the public (government transparency)
- Explaining decisions and actions to the citizens, acting on requirements expected for the task and accepting responsibility for failure (government accountability)
- Engaging citizens in decision making (participation)
- Enabling cooperation across different levels of government, between the government and private institutions and between the government and the citizens (collaboration). (2014, p. 279)

Open government as a performance management tool requires transparency of open data and relies on that data being used by a third-party advocacy or other watch-dog group (Schillemans et al. 2013). Advocates of these approaches point to the emphasis on organizational learning (Schillemans et al. 2013). A potential drawback of open data as a performance management tool is the shifting of the responsibility for accountability from the government officials to public stakeholders. These stakeholders may not have the technical ability to serve this role, so government agencies or other external institutions must provide technical training to facilitate citizens' use of open data.

## Conclusion

While the previous discussion spans more than a century of performance management systems, there are common themes that provide important lessons for public administrators. Fundamental to the implementation of a performance management system is the value of cultivating a learning organization. Organizations that develop the processes to learn from its successes and failures understand that performance cannot simply be used as a punitive function. Appropriate performance management system selection requires consideration of the institutional context – values, culture, and resources – in order to successful in implementation.

Of course, the limitations of comparing theoretical frameworks are that these models do not exist in the pure form in practice. In adapting these tools for practical application, administrators incorporate components from different models depending on the context of the organization.

Lastly, it is apparent in reviewing the last century of performance management systems that the public sector has exceedingly emulated the private sector. Scholars across the public administration literature have made productive careers supporting why administrators cannot operate government as a business (Denhardt and Denhardt 2000; Box 1999). As such, the public sector may benefit from the development of its own performance management system for the twenty-first century. Additional research and practice is needed to develop adaptive and values-based performance management systems for the future.

# Comparative Public Policy

Wilson Wong
Department of Government and Public Administration, The Chinese University of Hong Kong, Hong Kong, China

## Synonyms

Comparative policy studies; Comparative political studies; Comparative politics; Comparative public administration; Public policy studies

## Definition

Comparative public policy is an area of interdisciplinary study which uses public policy as its major unit of analysis for comparison across different systems and institutions, usually countries or governments. It typically asks questions about how, why, and to what effect different

governments pursue different or similar policies. It faces problems of contested identities of method versus field and the lack of a coherent and comprehensive theoretical framework. These problems are being addressed by its emerging research, which also contributes to the creation of integrated and impactful knowledge in social science.

## Introduction

Comparative public policy is an important area of study cutting across major disciplines in social science (Adolino and Blake 2011; Castles 1998; Heidenheimer et al. 1990; Rose 2005). It carries both academic and policy significance. In recent years, it is gaining strength and influence because of the growing awareness of the limitation of isolated and compartmentalized knowledge of traditional academic disciplines in policy applications and the pressing need to acquire theory-guided and empirically proven knowledge for resolving serious policy problems under a globalized environment.

Many traditional disciplines of social sciences often select their research questions based on their disciplinary interest and conduct the analysis following their own logic of theoretical inquiry. A single theoretical lens inevitably narrows the comprehensiveness and scope of its inquiry. While compartmentalization of knowledge can be taken as specialization of knowledge and gives the advantage of theoretical strength of a disciplinary approach, compared with an interdisciplinary approach, their outputs of research are often too partial and fragmented for providing a complete analysis of a public problem to meet the expectations of scholars and practitioners of policymaking (Raadschelders 2005; Riggs 1991, 1998; Welch and Wong 1998).

Advance in comparative public policy research holds the promise of moving both theory and practice forward not only in public policy but also in many major disciplines in social science related to public policy (Fitzpatrick et al. 2011; Heidenheimer 1985; Pontusson 1995; Rose 2005). With its interdisciplinary nature, comparative public policy can enhance theory development through integrating the theoretical lens and strengths of knowledge of different discipline. Building on a problem-based or issue-based approach and uses "policy" as its major unit of analysis, it allows a high level of integration between theory and practice. Moreover, adopting a comparative perspective, it assimilates experiences and cases across countries and regions in making a significant contribution to construct a global social science (Gulrajani and Moloney 2012). However, at the current stage of its development, there is still a gap between what it can deliver and what it has accomplished.

The main objective of this chapter is to help bridge that gap by introducing comparative public policy and discussing critically the challenges and opportunities it is facing. This chapter is organized into the following sections. It first defines the field by focusing on its uniqueness as well as relationships with similar areas of studies. The second section examines its crisis of contested identifies and reviews three key trends of its research. Two of them are carrying major hope of enhancing the studies by addressing its core problem of the lack of sophisticated and coherent theoretical framework dedicated to it. The third section discusses the major challenges and opportunities of its future development. It concludes by emphasizing the close and important linkage between comparative public policy and social science in their parallel and interactive development.

### Defining the Field: Uniqueness and Similarities

Since comparative public policy is mainly about studying public policy under a comparative context, answering the question of "what is public policy" should be the first and important step in defining comparative public policy. According to Anderson (2011), public policy can be defined as "a relatively stable, purposive course of action or inaction followed by government in dealing with a problem or matter of concern." He further supplemented this definition by stating that "this definition focuses on what is actually done instead of what is being proposed and intended; differentiates a policy from a decision, which is essentially

a specific choice among alternatives, and views policy as something that unfolds overtime" (pp. 6–7).

There are several important elements in the above definition. First, although there are many actors, including nongovernmental actors, in the making of public policy, because of its "public" nature which involves the use of public power and authority, government still plays a central and defining role in the making of public policy. It is the presence and involvement of government which makes the whole matter and process "public." Because of the central and irreplaceable role of government in public policy, comparative public policy is a comparison of policies made by different governments or public institutions. Second, public policy is a purposive and goal-oriented course of action. Although the final outcome of public policymaking can be irrational and may not really solve a public problem, it is often a rational compromise among different actors involved based on their goals and incentives filtered or structured by institutions. That is why public policy is different from a specific decision as emphasized by Anderson. Policy is often the outcome of a course of action among multiple players whose role and influence are defined by institutional and structural factors. It also means comparing public policy is essentially a comparison of the impacts of institutions (Heidenheimer et al. 1990; Pontusson 1995; Scharpf 2000).

Building on the main elements of public policy, Heidenheimer et al. (1990) define comparative public policy as "the study of how, why, and to what effect different governments pursue particular courses of action or inaction." Recognizing the influence of institutions on policymaking, they suggest the study of comparative public policy "requires learning aspects of the structures and processes through which governmental decisions are reached," and scholars should keep in mind the importance of these ultimate determinants of policy choices made by nations. They also emphasize the interdisciplinary nature of comparative public policy by arguing that it "can never become a self-contained specialized discipline" and it is always "located at busy crossroads in social sciences."

The interdisciplinary nature of comparative public policy is both a curse and a gift. It can enrich the content and perspectives of comparative public policy on the one hand but also cause concerns of overlapping boundaries and confused identities with other studies and disciplines. Table 1 shows the differences in terms of unit of analysis, core discipline, and main concerns in the development for three distinctive but interrelated areas of study: comparative public policy, comparative politics, and comparative public administration. They are all distinctive because they all have their uniqueness in terms of concerns or theoretical lens. At the same time, they are also

**Comparative Public Policy, Table 1** Major classification of comparative studies

| Fields | Unit of analysis | Core discipline(s) | Main concerns in development |
|---|---|---|---|
| Comparative public policy | Public policy | Interdisciplinary | Contested identities: method or field<br>Difficulty in theory development due to the complexity of the subject matter and its interdisciplinary nature of inquiry<br>Applying and "borrowing" theories from other disciplines, lack of a coherent and comprehensive theoretical framework |
| Comparative politics | Political systems and institutions | Political science | Limitation in power of analysis and scope of inquiry by a single discipline |
| Comparative public administration | Bureaucracy, administrative, and governance systems | Interdisciplinary | A wider range of theories but mostly "borrowing" from other disciplines. lack of a coherent and comprehensive theoretical framework<br>A wider scope of inquiry from its problem-based approach but focusing mainly on administrative apparatus and capacity and the policy implementation stage |

interrelated as they do share some overlapping elements. One obvious example is all of them adopt comparative approaches and methods in the general arena of research in social science.

Comparative public policy is different from comparative politics as the latter is a subfield of political science, while comparative public policy is interdisciplinary in nature of which political science is only one of the pillars of its theoretical foundation (Heidenheimer 1985; Pontusson 1995; Scharpf 2000). The two are also different in terms of their unit of analysis as comparative public policy uses "policy," not political systems and institutions as its unit of analysis. To comparative public policy, political systems and institutions are some of its important independent variables rather than its unit of analysis. Comparative public policy and comparative public administration share many similarities, for example, both of them are interdisciplinary in nature and adopt a problem-based approach (Fitzpatrick et al. 2011; Gulrajani and Moloney 2012; Jreisat 2005). In general, however, comparative public policy is a broader and more inclusive area of study. The concept of policy, a key focus of comparative public policy, is broader than the concept of bureaucracy, a main concern in comparative public administration. Comparative public policy goes beyond the study of administrative apparatus and capacities which is linked mostly to the stage of policy implementation and covers all major stages in the policy cycle in its analysis.

## Contested Identities and Major Trends in Research

Being unique does not mean comparative public policy does not encounter any major problems and crises in its identity and development. Owing to the lack of a coherent and comprehensive theoretical framework of its own, "borrowing" theories from other well-established disciplines is still a common practice in its research (Heidenheimer 1985; Heidenheimer et al. 1990; Pontusson 1995; Scharpf 2000). This should not be taken as the total fault of its scholars as theory development is particularly difficult in comparative public policy because of the complexity and multifaceted nature of its subject matter. Nevertheless, this still leads to a serious problem of contested identities of "method versus field" in comparative public policy (Feldman 1978). There is a debate on whether comparative public policy has reached the status of being qualified as a field or it should be taken as no more than a method of using comparative approaches in research. As summarized by Feldman (1978) very well, "without a guiding theory, explanations for policy become lists constantly awaiting addenda, and comparative cases hover close to a line of anecdote" (Feldman 1978, p. 300). Although these words were written more than three decades ago, to a considerable extent, the situation described still persists. In many textbooks of comparative public policy, they are still relatively thin and weak on theory but are rich and more detailed in the discussion of cases of different countries and policy areas.

While its undeniable comparative public policy is lagging behind in developing its own theories and frameworks, there are some encouraging new developments on this aspect. Gupta (2012) summarizes three major categories of current research in comparative public policy: using comparative method, comparing theories across institutional configurations, and comparing theories to one another. By emphasizing being "comparative" in research, the first category is basically a continuation of the tradition of comparative public policy. The second and third categories, however, are promising developments in transforming the study of comparative public policy from a method into a field, a status which it should be long deserved. The development of comparative public policy in the direction of being more theory oriented is not only benefiting itself but also social science disciplines related to public policy. It is because comparative public policy research is an important testing ground of the robustness and generalizability of theories in social science. The recent development in comparative public policy research should be more appropriately considered from a wider scope as a positive step for enhancing of the development of theories in social science.

According to Gupta's (2012) review, the first category of research in comparative public policy

refers to the traditional use of comparative method to answer two primary questions: how do policies different across countries and what explains these differences. This category still represents a majority of the studies and serves as the existing foundations of comparative public policy research. With the rising importance of multilevel governance, a new addition to this category of research is in addition to comparing nationally, many studies also compare subnationally. This category of research, however, still suffers from the weakness of confining themselves to identifying differences across systems and countries without intensively answering the question of "why" through coherent and rigorous theoretical frameworks. Even if a theoretical lens is applied, it is also often borrowed from other fields and disciplines.

The hope of transforming comparative public policy into a respected and well-established field of study is pinned on two emerging trends of research (Gupta 2012). These two categories are highly interrelated by their strong theoretical orientation. The main difference between them is the second category compares a theory (or theories) across institutional configurations, while the third category of studies focuses mainly on comparing theories in answering the same question in policy research. Both of them have the potential of pushing forward the knowledge frontier of comparative public policy by contributing to theory development in public policy. Together, they form a mutually benefiting process which generates positive inputs to both theories in public policy and social science disciplines related to public policy studies.

One example of the second category of comparative public policy research is the testing of the validity and applications of Advocacy Coalition Framework (ACF), a major theoretical framework for analyzing policy equilibrium and change by key variables including policy learning, policy beliefs, policy coalitions, and policy subsystems, across different political settings, systems, and contexts. According to Sabatier and Weible (2014), ACF has been applied in 224 studies with applications in all continents and multiple policy areas including environment, health, finance/economics, social, education, technology, and recreation/tourism. A major contribution of this category of research is the development and applications of theories specifically for public policy process by testing their explanatory power across institutional configurations. By putting the theories of public policy process into empirical testing across institutional configurations, it allows researchers to revisit their theories and refine them to take into consideration of the influence of contextual factors, including culture, political structure, economic system which often differ across countries but do matter in affecting policy outcome, and behaviors of policy actors.

Similar to the category of research comparing the power and validity of public policy theories across institutional configurations, the third category of emerging research in comparative public policy puts a strong emphasis on the use of theoretical lens in analysis. However, instead of testing a single theory across institutional configurations and settings, it uses multiple theories to answer the same research question in public policy in order to develop the best theory. One good example of this category of research is a study by Ness (2010) which examines how state governments in the US determine merit aid eligibility criteria to assign college funding by using three competing theories of policymaking, ACF, multiple streams (MS) and the electoral connection (EC) framework. The study finds MS is the most useful theoretical framework for understanding and explaining merit aid policy in the US though this does not exclude the fact that the other two theories also have their explanatory value. As a result, in concluding his study, Ness designs a revised MS model which also integrates the useful elements from the two other theories. Although this third category of research mainly focuses on a single policy question, by comparing and integrating theories, it has also helped to serve the same purpose of building better and more powerful theories of public policies which are adaptive and resistant to settings and contexts.

## Challenges and Opportunities in Future Development

The two categories of emerging research are really two sides of the same coin. Regardless of

comparing theories across institutional configurations or comparing theories to one another, they share the same aim of developing robust general theories which can travel across systems, countries, and contexts. They have been proved as productive and useful in addressing the two problems haunting comparative public policy for decades, the use of comparison methods without a theoretical framework and the proliferation of diverse and misplaced theories borrowed casually from other fields. To further move the studies of comparative public policy forward in terms of both academic and policy values, there are hurdles scholars must recognize and overcome. As a roadmap for its future, major challenges and opportunities of the future development of comparative public policy are identified in Table 2.

First of all, challenges of the complex and multifaceted nature of the field caused by its policy-based nature can be taken as an incentive for building knowledge which integrates theory and practice, particularly in constructing middle-range theories as an intermediate solution. Its problem of contested identities of field versus method has been addressed by the two emerging trends of research, which also provides a good opportunity to construct a theory in social science that is integrative, generalizable, universal, global, robust, and actionable in nature. It has been a common complaint in comparative research that there are great difficulties to compare across systems due to problems of identifying common variables and contextual factors such as culture and tradition (Haque 1996; Moon and Ingraham 1998; Welch and Wong 1998; Wong 2013). Fortunately, to a large extent, these difficulties have been relieved under globalization. Globalization provides a more interactive and interconnected environment for introducing more common variables, such as economic and public management reforms and information and communication technology (Jordan et al. 2005; Welch and Wong 2001; Wong 2013). In fact, globalization itself and actors or pressures induced by it, including global institutions, global public-private partnerships, and transnational networks, can also serve as the common variables (Stone 2008; Welch and Wong 1998). Studying

**Comparative Public Policy, Table 2** Future development of comparative public policy: challenges and opportunities

| Comparative public policy | Challenges | Opportunities |
|---|---|---|
| **Subject of study** | Using policy as the unit of analysis, a problem-based and policy-based approach, and a comparative perspective makes the subject of inquiry multifaceted and too complicated to be theorized<br>Confusing identity of field versus method | Integrating theory and practice, policy, and research<br>Two emerging trends of research<br>Part of the problem can be resolved by constructing middle-range theories that compare similar countries and systems rather than all of them |
| **Theory development** | Most theories are "borrowed" from other social science disciplines and therefore are not compatible and coherent as a theoretical lens | Provides a valuable opportunity to construct a theory in social science that is integrative, generalizable, universal, global, robust, and actionable in nature |
| **Common variables** | Difficulties to compare across systems due to problems of identifying common variables and contextual factors (e.g., culture, tradition, and history) and defining them | Globalization provides a more interactive and interconnected environment for introducing more common variables<br>Globalization itself and global institutions can serve as the common variables |
| **Research collaboration** | Require an extreme high level of requirements in terms of contextual knowledge, methods, and disciplinary training | Problems can be resolved by team-based collaboration, with institutional support and incentives |
| **Impact and significance** | Practical policy advice may come at the expense of level of theoretical content | Visible policy impact increase awareness of importance and contribution of social science knowledge |

how these variables affect each country and system differently can generate many meaningful insights to contribute to the theory development of comparative public policy.

The rise of globalization does fit well in enhancing the two categories of emerging research. Globalization makes comparing theories across institutional configuration more easily and meaningful as all countries in the world are being impacted by globalization (Welch and Wong 1998, 2001). In essence, it gives scholars of comparative public policy something common to compare with in studying countries and their institutional configurations to avoid the embarrassing situation of spending a large amount of fruitless effort on comparing apples to oranges. At the same time, with the development of a large group of theories to capture the effect of globalization on various aspects of states and governments, these theories present an ideal opportunity for the second category of emergence research in comparative public policy. Studies of globalization has provided its help to the second category of research by generating multiple theories to be tested for their explanatory power and contextual relevancy in its own research, which may include in-depth case study of an individual country or a group of countries, for identifying and developing the best theory to answer a policy research question..

Due to the complex, multifaceted and interdisciplinary nature of its subject matter, studies of comparative public policy demands scholars and researchers to have a very high level of knowledge and skills, which would include knowledge of different systems and institutions across countries and contexts. Apparently, it is very difficult and can even be unrealistic to expect any individual researcher to meet all these high levels of requirements and expectations for conducting good-quality research in comparative public policy. This issue of "competence" has been a chronic problem long identified as an obstacle hindering the development of comparative public policy (Feldman 1978). Therefore, it will be more reasonable to seek for collaboration with research conducted on a team basis. Each member should possess knowledge in a particular country or a small group of countries among those being compared. They should also represent a wide and diverse background in disciplinary and methodological training.

Calling for more effort in collaborative and interdisciplinary research has been made in many literature reviews and summary works of comparative public policy for decades but has not been fully answered. It becomes increasingly clear that institutional restructuring and incentives would be necessary for the development and success of comparative public policy. For example, universities should create more collaborative projects and programs that promote joint cooperation of scholars from different disciplines. The setting up of those teams alone is not enough to ensure commitment and concentration from members if there is a lack of institutional incentive and recognition built into the personnel system of universities. Therefore, it is equally important that such collaborative teams are strongly supported by incentives on both team and individual levels. Moreover, interdisciplinary and policy-oriented research outputs should be assessed and valued in the decisions of tenure and promotion of individual scholars. Despite that, it must also be fully realized that while institutional support for comparative public policy research is critical and necessary, it is still the responsibility of scholars in comparative public policy to prove to universities, policymakers, and society the impact and significance of their research in order to convince them to make the above investment.

## Conclusion

This chapter explains the importance of comparative public policy in terms of both policy and research. It also discusses how comparative public policy can move both theory and practice forward by integrating theories from different disciplines and creating knowledge that is not only actionable for designing effective policy tools but also generalizable across countries, institutions, and contexts. It represents an attempt to overcome a long-time problem of compartmentalization of knowledge in the traditional social science disciplines which limits the scope and comprehensiveness of analysis of public policies. The problem of

compartmentalization has reduced the usefulness and weakened the relevancy of social science knowledge in a globalized and interactive world in which citizens and policymakers have legitimate expectations for universities and scholars to provide educated insights on solving major public problems.

At the moment, a gap still exists between the current state of comparative public policy research and its potential power. Before the studies of comparative public policy can make major progress, some major challenges and obstacles must be addressed. Among them, due to the complex and interdisciplinary nature of its subject matter, it is extremely difficult to develop a theory of its own which triggers an identity crisis. Without a coherent and comprehensive theoretical framework, it is often perceived as a method rather than a respected field of study. Reviewing the history and development of comparative public policy, a major lesson one should have learnt is it is not likely those problems and challenges could be overcome by efforts of scholars and researchers at an individual level. To ensure comparative public policy can fulfill its promise, it would need more than the diligence of individual scholars and must require institutional commitment in the social science enterprise on how comparative policy research is going to be recognized, conducted, and supported.

What is often needed is more cooperation and a better division of labor. Successfully overcoming problems of the development of comparative public policy would demand scholars and researchers coming from different disciplines and backgrounds to work intensively together on a collaborative basis. Instead of requiring each member of a research team having the same set of skills and knowledge in comparative public policy, which is often too ambiguous and demanding, it is more realistic and convenient to assemble a team of researchers who could complement each other in terms of country information, disciplinary knowledge, and methodological training. This collaboration should be backed up by institutional restructuring, support, and incentives. Furthermore, the co-optation of policymakers into the collaborative research team could also be a good suggestion to ensure the close linkage between research and practice.

The investment needed for further developing and enhancing the study of comparative public policy is definitely not small. However, this investment should be worthwhile as the benefits and contributions are much bigger. The globalization environment also provides a valuable opportunity never available before for scholars of comparative public policy to make their studies meaningful and manageable. By using globalization and similar variables as common variables in comparative public policy research, they are no longer comparing countries without connection and similarities which is just like comparing apples and oranges. In short, globalization has reinforced the two emerging trends of research in comparative public policy, comparing theories across institutional configurations and comparing theories to one another, to create more powerful, robust, and generalizable theories in public policy.

Development of comparative public policy also enhances knowledge creation in social science and raises the visibility and impact of social science knowledge. It is the mission of modern social science to create a body of integrated knowledge which has the ability to incorporate experiences across countries and disciplines for understanding issues of public concern as well as creating high impacts (Bastow et al. 2014). This mission points to the creation of a global science, a more inclusive and reliable scholarship, which "ultimately would become a cumulative and collaborative social science enterprise, one that links theory, methods, and data in robust and defensible ways" (Gulrajani and Moloney 2012, p. 85). By enhancing the analytical and explanatory power of its theories, the development of comparative public policy is part of the critical effort of increasing the visibility and validity of social science knowledge. Consequently, from a broader perspective, the state of comparative public policy is always a major indicator of the degree of success of social science scholars in pulling their knowledge together for making an impactful and discernable contribution to society.

## Synonyms

European countries' comparative study; IPSAS 17 comparative analysis

## Definition

Comparative public sector accounting is a research area in which public sector accounting systems are investigated and compared among different countries in order to detect, with quantitative and qualitative methods, similarities and/or differences and the relative reasons.

## Introduction

European public sector accounting systems are affected by changes converged toward the search for a uniform accounting behavior in order to homogenize – both at national and international levels – the language of the financial statements of public entities (Adam et al. 2011). The convergence process in accounting practices aims to satisfy the information needs of different kinds of stakeholders as well as making financial statements comparable, transparent, and useful (Benito et al. 2007). An important element in providing useful information is the accounting treatment and reporting of "heritage assets" (HA).

Contrary to businesslike assets, heritage assets (e.g., historical buildings, collections, monuments, archaeological sites, landscapes, etc.) are special and unique, not only for societal reasons but also to be preserved for the following generations. The users of governmental financial reporting, particularly the ruling politicians who set our their policies in the area in which they are authorized, are socially, culturally, and emotionally interested in these assets rather than in their functional use only.

However, studies have shown how financial reports often result in a gap between what is reported in the governmental financial statements and what information is needed by the users (Liguori et al. 2012). In order to streamline the different accounting practices in governments, the IPSASB has been established to harmonize the governmental accounting standards. Established in 2000, the IPSASB remains the only worldwide standard setter for governments and has developed 40 accrual accounting standards based on the IFRS for business enterprises. For the financial reporting of property, plant, and equipment that includes heritage assets, the IPSAS 17 was issued in 2007. However, even if in April 2017 IPSASB published a consultation paper (CP) on financial reporting for heritage in the public sector, the question whether this IPSAS 17 results in financial reporting that meets the heritage assets' user needs has not sufficiently been answered yet.

The concept of cultural and artistic heritage has been defined by some supranational organizations and standard setters, resulting in multiple definitions. Heritage assets can be conceptualized with the definition of IPSAS 17 "property, plant, and equipment." IPSAS 17 states that *some assets are described as heritage assets because of their cultural, environmental or historical significance* while also providing some specific examples and characteristics. The uniqueness of heritage assets is the difficulty to identify a book value that reflects the cultural, environmental, educational, and historical value of these assets (Carnegie and Wolnizer 1995). Their value may increase over time (even if their physical condition deteriorates); therefore it is difficult to estimate the useful life that may be indefinite (Aversano and Christiaens 2014). These issues have created an important debate on the best way of representing heritage assets in a financial statement. In concern of the accounting treatment, scholars suggested a *holistic approach* for heritage assets; more specifically, the status of the capital goods, assigned by the authorized government, should determine its accounting treatment. If the capital goods have the status of businesslike assets, the assets should be included on the balance sheet. If they have a societal status (such as merit or collective public goods), these goods should not be included on the balance sheet, but should be disclosed and documented in the off-balance sheet.

Regarding the value to indicate in the balance sheet, international accounting standards look favorably upon a valuation at historical cost or fair value. However, in many cases heritage assets cannot be reliably valued in financial terms. Some authors even claim that giving a value to heritage assets can have profound negative consequences on the accountability and decision-making process since the decisions are based on wrong or incomplete values (Aversano and Christiaens 2014). Therefore, it has been suggested that the information system should provide more descriptive information, e.g., the nature and characteristics of the heritage assets owned, their physical condition, etc. (Carnegie and Wolnizer 1995). These studies reveal the controversial subject of the financial reporting on heritage assets, and thus

one can question the appropriateness of the accounting standard IPSAS 17 regulating the financial reporting of heritage assets.

Apart from studies that focus on different characteristics and functions of heritage assets, there are some publications dealing with the accounting treatment of heritage assets. A few studies go further and examine certain users being stakeholders and their expectations regarding governmental financial reporting. However, there is lack of research in which accounting standards are tested with respect to user needs, specifically for heritage accounting prescriptions included in the IPSAS 17. It should be pointed out that the presence of that specific standard does not automatically lead to an effective and successful use by policy makers.

## Users and Their Information Needs

Within this wide range of user groups (e.g., citizens, financial institutions), a great majority of authors consider politicians to be the most important users group (Liguori et al. 2012).

Politicians are partly external users, because they have no influence on producing financial statements and partly internal because they have an influence on the management that is reported in the financial statements. The ruling politicians (e.g., mayor and aldermen in a local government) represent one of the most concerned users of governmental financial reporting. They use this statement mainly for communicating to the citizens/voters how the monetary resources provided by them have been used (public accountability reasons) as well as any future decisions about the activities (decision-making reasons).

Politicians, to whom citizens have delegated the power to manage the public assets, have a duty to respond to the results of their activities demonstrating the "value" generated (or possibly destroyed) from the activities carried out (Carnegie and Wolnizer 1995).

Concerning the information needs, a core set of information needs common to the majority of stakeholders can be identified, and, in addition to these common information needs, the management of heritage assets necessitates additional disclosures related to their specific features. In particular, the users are interested also in descriptive information, such as nonfinancial information relating to the objectives of entities holding the assets, the nature and characteristics of the heritage assets owned, their physical condition and maintenance, and measures of performance as the number of visitors.

## Comparative Public Sector Accounting

The adequacy and usefulness of IPSAS 17 prescriptions in relation to the reporting of heritage assets to the user needs can be analyzed with a comparative analysis using the Italian and Flemish responsible politicians as a reference.

Flanders is a part of Belgium, and Italy and Belgium are two European countries that can be considered a prototype of the countries with Roman roots rich of history, art, and culture. The importance of heritage assets in both countries is also reflected in their involvement in related policies at the European level. Also, both countries are early birds when ratifications were instituted (e.g., Convention on the Protection of the Underwater Cultural Heritage, Convention for the Safeguarding of the Intangible Cultural Heritage), and they have common initiatives such as Isola Comacina and the Bibliotheca Corviniana Collection. This demonstrates their mutual interest in the topic.

Finally, they also have similar accounting systems, and there is a degree of homogeneity in the way they present financial statements (Benito et al. 2007). These similarities do not imply that both countries are the same. Undoubtedly, there are many organizational and institutional differences, but they are fairly comparable.

IPSAS 17 should satisfy the particular information needs of users and should provide information useful for decision-making and public accountability. Because IPSAS is often used as a benchmark by European governments, it is necessary to examine whether the disclosure requirements of IPSAS 17 are useful, which is questioned by some previous studies in concern of heritage assets.

| No | Items | IPSAS 17 | Average importance Italian councils | Average importance Flemish councils |
|---|---|---|---|---|
| 1 | **Cost of the preservation, conservation, restoration, maintenance of the Has** | – | **4.6** | **4.2** |
| 2 | **Identification of the funding sources for acquisitions (e.g., government grants, cash donations, donated assets, and utilization of existing cash resources)** | – | **4.4** | **4.1** |
| 3 | **Information about allocation and uses of financial resources** | – | **4.3** | **3.9** |
| 4 | **Description of the heritage assets** | – | **4.2** | **3.8** |
| 5 | **Policies for the preservation, conservation, restoration, and maintenance of the heritage assets** | – | **4.2** | **3.8** |
| 6 | **Custody costs** | – | **4.2** | **4.0** |
| 7 | **Physical condition of the heritage assets** | – | **4.1** | **3.5** |
| 8 | **Comparison between the current results and those of the previous years** | – | **4.0** | **4.0** |
| 9 | **Performance indicators** | – | **4.0** | **3.6** |
| 10 | **Budget vs actual information** | – | **4.0** | **4.2** |
| 11 | **A 5-year financial summary of activity (including acquisitions and disposals of Has)** | – | **4.0** | **3.7** |
| 12 | **Financial value** | X | **3.9** | 3.3 |
| 13 | **Overview of entity operations (acquisitions through entity combinations, contract commitment for the acquisition of the heritage assets)** | X | **3.9** | **3.9** |
| 14 | **Useful lives of assets** | X | **3.8** | 3.0 |
| 15 | **The estimated costs of dismantling, removing, or restoring items of HAs** | X | **3.7** | **4.3** |
| 16 | **Restrictions on the heritage assets** | X | **3.7** | **3.7** |
| 17 | **Measurement based on financial value** | X | **3.6** | 3.3 |
| 18 | **Event after financial statement date** | – | **3.6** | **3.9** |
| 19 | **Depreciation method used** | X | **3.6** | 3.0 |
| 20 | **The temporarily idle heritage assets** | X | **3.5** | **4.0** |
| 21 | Date of the revaluation | X | **3.5** | 3.3 |
| 22 | Depreciation value | X | 3.4 | 3.0 |
| 23 | Revaluation method used | X | 3.4 | 3.0 |
| 24 | Changes in valuation criteria | X | 3.3 | 3.3 |
| 25 | The value of the heritage asset retired from active use and held for disposal | X | 3.3 | **3.9** |

Since Italy and Flanders have many common characteristics and because IPSAS are supposed to generate the same answer for the same user needs, a comparative analysis can be tested if IPSAS 17 accomplishes Flemish user needs of mayors and councilors regarding heritage assets.

Therefore, a survey on 293 Italian local governments and 308 Flemish local governments was carried out by sending a questionnaire to the mayors and relevant aldermen (i.e. aldermen of culture and heritage who are appointed by the overall council). The analysis focuses on local governments because they have an important role in the management and delivery of public services. All Italian and Flemish municipalities have a mayor (elected directly by the population), a cabinet, a city council, and a professional bureaucracy.

Data were collected through a questionnaire sent to the Italian and Flemish mayors and

| Class | No of items | | Percentage of satisfaction | | Percentage of dissatisfaction | |
|---|---|---|---|---|---|---|
| | Italy | Flanders | Italy | Flanders | Italy | Flanders |
| Items preferred by responders and requested by IPSAS 17 | 9 | 5 | **42.9%** | **29.4%** | | |
| Items preferred by responders and not requested by IPSAS 17 | 12 | 12 | | | **57.1%** | **70.6%** |
| Total | **21** | **17** | **42.9%** | **29.4%** | **57.1%** | **70.6%** |

aldermen. The list of the information needs (items) from the point of view of the mayor and aldermen was created based on various user need research publications and the requirements of IPSAS 17. The questionnaire contained different questions, asking the level of importance of specific issues of reporting of heritage assets as well as the perception to what extent their information needs were met.

The individual averages of all the items are compared to understand which items significantly contribute to the usefulness for politicians. The items with an average importance of at least 3.5 were considered useful because these values express the highest degree of importance (Aversano and Christiaens 2014). Focusing on the items of at least 3.5, the percentages of satisfaction and dissatisfaction of the user needs by IPSAS 17 were calculated and compared. The percentage of satisfaction stands for the number of items required by IPSAS 17 in relation to the total items. The ratio of items not required by IPSAS 17 highlights the percentage of dissatisfaction.

## The Percentage of Satisfaction of the User Needs by IPSAS 17

After listing the specific information about heritage assets (items) according to the degree of importance by the Italian municipalities, the items with an average importance of at least 3.5 are the first 21 items shown in following Table. Next to these results, the average importance of the items given by the Flemish councils is listed:

The Table reveals how both the Italian and the Flemish councils prefer many items which are not required by IPSAS 17. In addition, the Flemish results are similar to the Italian ones and can be regarded as a confirmation despite certain cultural and administrative differences.

Based on the outcomes, the following table summarizes the results regarding the percentage of (dis)satisfaction for Italy and Flanders divided. The empirical results assert that the user needs information of governmental financial statements are satisfied by IPSAS 17 less in Flanders than Italy; in fact the percentage of satisfaction is 42.9% for Italy and 29.4% for Flanders. Consequently, the IPSAS percentage of dissatisfaction is 57.1% for Italy and 70.6% for Flanders. This means that the majority of the items considered important for the Italian and Flemish politicians are not required by IPSAS 17. In other words, the adoption of IPSAS 17 would not satisfy an important number of user needs.

## Conclusion

In concern of the usefulness and ease of use of IPSASs for governments, the comparative analysis highlights that IPSAS 17 does not sufficiently correspond to the needs of the politicians. Moreover, IPSAS 17 responds to the user needs about heritage assets for a less important part of Italian and Flemish local governments. Hence, if IPSAS 17 is used as a benchmark when changing the financial reports, this will not be in line with the needs of the main user group, e.g., politicians, regarding heritage assets.

The findings also highlight how the politicians are interested in finding adequate information about heritage assets in the governmental financial reports. These information needs are oriented

toward achieving and maintaining the popular consensus, interpreting the needs of the community, and trying to satisfy them.

Even if the Flemish politicians' evaluation is less enthusiastic, the findings confirm that Italian and Flemish politicians present similar results both in terms of information requested and reasons for these information needs. In fact, both Italian and Flemish politicians are mainly interested in the cost of preserving heritage assets, identifying the funding sources to buy them as well as information about the allocation and uses of financial resources. The reasons why financial reports are used in relation to heritage assets is for financial and public accountability reasons. This can be explained by the fact that the aldermen are not the direct supervisors of these public organizations.

Moreover, these information needs often clash with the accounting problems of heritage assets. In relation to this gap, the analysis confirms that narrative information is appreciated by politicians, such as the identification of the funding sources for acquisitions, a description of heritage assets or the policies for preservation conservation restoration, and maintenance of the heritage assets. However, also numeric accounting information is considered interesting, such as the costs of the preservation, the allocation and uses of financial resources, or the custody costs. Remarkably, performance information is considered useful, but not that significant as some other forms of narrative or disclosure information. The case on heritage assets represents an extreme case of accounting difficulty. Typical for heritage assets, the rules and behaviors, with particular reference to the evaluation aspects, do not comply with the features of uniqueness and non-repeatability; therefore, the inclusion of more narrative information is considered useful (Aversano and Christiaens 2014). A careful consideration of which information is worth the effort in concern of heritage assets is shown to be necessary (Liguori et al. 2012). When looking at an explanation why IPSAS 17 lacks a number of regulations and prescriptions that are expected by the users, one could argue that their businesslike accounting background is the main reason. The IPSAS Board mainly consists of accountants used to business accounting, and they are not familiar with politicians' needs not with heritage assets being a specific governmental issue.

Up to now, the IPSAS 17 has been neither amended nor has a new standard been issued. If municipalities voluntary contribute to the IPSAS 17 regarding heritage assets, they will be obliged to collect useless information relating to heritage assets, which is not without costs. However, the implementation of the IPSAS 17 in the Italian and Flemish governments should take into consideration the more general problem that IPSASs are based on accrual accounting, while in the two countries analyzed, the cash-based budgetary accounting system still has an important role.

# Comparative Standards of Administration: Auditing

Kgobalale Nebbel Motubatse
Auditing, Tshwane University of Technology, Pretoria, South Africa

## Synonyms

Accountability; External audit; Financial statements; Internal auditing; Public sector; Public sector audit; Public service institutions

## Definition

Public sector auditing is essential in that it provides legislative and oversight bodies, those charged with governance and the public with information and independent and objective assessments concerning the stewardship and performance of government policies, programs, or operations (INTOSAI Professional Standards Committee n.d.).

Public sector auditing refers to both internal and external auditing. It plays a key role in good governance.

## Introduction

The emergence of public sector auditing as a set of processes and verification approaches, distinct from those in use in private sector auditing, can be traced to the establishment of the Australian National Audit Office in 1979 (Guthrie and Parker 1999). This institution is viewed as a vehicle to enhance the efficiency of government systems, and with the ability to influence agendas and activities at individual, organizational, institutional, sociopolitical, and socioeconomic levels in the Australian public sector (Guthrie and Parker 1999). According to Humphrey et al. (1993), public sector auditing, as a governance type, emerged in the United Kingdom as a means to promote accountable management in public sector organizations. The military structures mimicked by the British Government in the nineteenth century have been shown to have significantly influenced the emergence of the public sector auditing and accounting functions in Britain (Funnell 1997). The need for enhanced accountability had been at the center of the establishment of a public sector auditing capacity, as controls over spending levels were proving inadequate in all government departments (Funnell 1997). Public sector auditing is thus tasked with strengthening governance's effectiveness and increasing the public's confidence in the public sector.

## History of the Office of the Auditor-General in South Africa

South Africa occupies the southernmost tip of Africa. The country has common boundaries with Namibia, Botswana, Zimbabwe, and Mozambique. While the Swaziland and Lesotho attached to South African territory in the Southeast. The country has a total surface area of about 121,9090 square kilometers (Statistics South Africa 2011). Prior to 1994, the apartheid government used the auditing legislation based on the British model and became established and remained as the unshakeable foundation of the audit office throughout the ups and downs of those times of the system that based on the principles of independence and integrity to improve accountability. The Supreme Audit Institution was constitutionally mandated under the South Africa Act of 1909 (Act No. 1 of 1909), section 132, which stated that the Governor-General in Council should appoint a Controller and Auditor-General who shall hold office.

Later the Act was shadowed in 1911 by the Exchequer and Audit Act (Act No. 21 of 1911), which laid out all the regulations and processes for the guidance of auditors of accounts in the provinces of the Cape of Good Hope, Natal, Transvaal, and Orange Free State in the examination and audit of accounts of the province. The Auditor-General was also required to scrutinize the accounts of government entities or any public

body that are delivered to him and report to Parliament annually on the results. At that time, The Exchequer and Audit Act of 1911 was used to guide auditing and accounting right up to the late 1970s before the gradual evolution of the accounting profession began to exert its influence. Each provincial government had to keep account books and accounts for the whole of the receipts and payments. At that time, South Africa was demarcated into four provinces and ten homelands (see the map below) (Figs. 1 and 2).

After 1994, in the new South Africa, the Auditor-General South Africa (AGSA) was given a new constitutional mandate in terms of section 188 of the Constitution to audit and report on the accounts, financial statements, and management of all institutions that are significant users of public money to the National Assembly as the first house of Parliament in South Africa. The AGSA is accountable to the National Assembly in terms of section 181(5) of the Constitution and section 3(d) of the Public Audit Act of 2004

**Comparative Standards of Administration: Auditing, Fig. 1** Old South Africa map. (Source: https://www.sahistory.org.za)

**Comparative Standards of Administration: Auditing,**

and has to report on its activities and performance of its functions in terms of section 10 of the Public Audit Act.

## The Role of the Auditor-General in South Africa

Auditor-General is a person appointed by the Parliament for a fixed term of between 5 and 10 years to run the institution. The appointed person becomes the head of the institution and is accountable for the administration. The Auditor-General of South Africa (AGSA) is the supreme audit institution (SAI) of South Africa. It is the only institution, which by law has to audit and report on how the government is spending the South African taxpayers' money. This has been the focus of the AGSA as an institution since its inception in 1911 until now. The institution is seen as the key role player to strengthen the democracy by enabling accountability and governance in the public sector through auditing, while building public confidence. The institution is responsible for auditing the national and provincial state departments and administrations, including municipalities and any other public institution or entity.

In addition, the institution reports on the **following types of audits** (AGSA 2011):

**Regularity Audit**

- Report on the financial statements
- Report on other legal and regulatory requirements
- Report on status of internal control

**Investigations**

- Report on factual findings with regard to financial misconduct, maladministration, and impropriety, based on allegations or matters of public interest

**Special Audits**

- Report on factual findings, for example: Donor-funding certificates for legislative compliance

**Performance Audits**

- Report on the economic, efficient, and effective utilization of scarce resources

**Environmental Audits**

- Report on the effect of policy implementation and compliance

Over and above these entity-specific reports, the audit outcomes are analyzed in general reports that cover both the Public Finance Management Act (PFMA) and Municipal Finance Management Act (MFMA) cycles. The AGSA tables report to the legislature with a direct interest in the audit,

namely, Parliament, provincial legislatures or municipal councils. These reports are then used in accordance with their own rules and procedures for oversight.

## Public Sector Auditing

Public sector auditors play an important role in achieving effective public sector governance (Institute of Internal Auditors 2012). The AGSA is a member of the International Organization of Supreme Audit Institutions (INTOSAI), which oversees the setting of global audit standards for all external audit communities in public sector organizations. INTOSAI provides the local Supreme Audit Institution (SAI), commonly recognized as the Auditor-General South Africa (AGSA), a framework within which public sector audit organizations focus on accountability and transparency in the use of public funds. The AGSA is thus uniquely placed to contribute to building and sustaining stronger and more effective accountability mechanisms for the government and its citizens. The AGSA is a member of INTOSAI, which is an autonomous global organization of government external audit institutions, and has special consultative status with the Economic and Social Council (ECOSOC) of the United Nations (AGSA 2011). South Africa's Auditor-General (as the government's external auditors) has been recognized for the role it is playing in promoting good governance processes in the country's public sector. Laws such as the Public and Municipal Finance Management Acts (Acts No. 1 of 1999 and 56 of 2003) (PFMA and MFMA) are aimed at ensuring proper management, transparency, accountability, stewardship, and good governance in national, provincial, and local government.

Consequently, Independent Regulatory Board of Auditors (2012: 12–13) outlines the benefits of audit in the public sector may include the following:

- Responsiveness to changing environments and stakeholder expectations, without compromising independence.
- Ensuring that government is held accountable for using resources legally and responsibly, for the purposes intended, and economically, efficiently, and effectively.
- Credible source of independent and objective insight and guidance to facilitate foresight and continuous improvements in government.
- Empowering the public to hold government accountable and responsive, through objective information, simplicity and clarity of the message, and convenient access to auditor's reports and messages in relevant languages.
- Enabling the legislature, one of its commissions, or those charged with governance to discharge their different responsibilities in responding to audit findings and recommendations and taking appropriate corrective action.
- Following up on audit findings and implementation of recommendations
- Enhancing transparency and accountability
- Clean administration through ethics compliance
- Service excellence and quality considerations
- Good governance
- Effective communication

## Internal Auditing in the Public Sector

Internal Auditing means an independent, objective assurance and consulting activity designed to add value and improve an Institution's operations. It helps an organization accomplish its objectives by bringing a systematic, disciplined approach to evaluate and improve the effectiveness of risk management, control, and governance processes (Institute of Internal Auditors 2009).

In the South Africa, internal auditing is recognized in the regulatory framework adopted by the public service, broadly covered by the Public Finance Management Act and the Municipal Finance Management Act, which are applicable to the public institutions. These regulatory frameworks require the public institutions to establish an internal audit functions. The responsibility of internal audit is to provide advice, support, and technical and professional expertise to assist managers in fulfilling their responsibilities.

The main functions performed by internal auditors cover the following areas:-

- The development, planning, and management of the internal audit function itself (including the establishment of its independent status and the operation of quality assurance provisions).
- The establishment and operation of effective relationships with other assurance providing services such as risk management and external audit.
- The planning and execution of a range of audit engagements evaluating and reporting on various aspects of the work of the department.
- The provision of consultancy support to departmental management to assist them with improvements in their systems and procedures (Office of the Accountant-General 2011).

The following are applicable options of services for the functioning of internal audit in the public sector:

- *In-house* – where there is a fully established internal audit within the institution
- *Co-sourced* – where there is a presence of a core internal audit capacity within the institution, which is supplemented by the services of an external service provider.
- *Outsourced* – where the internal audit function of an institution is fully outsourced to an external service provider.
- *Shared* – where more than one institution shares the pool of internal audit resources (Office of the Accountant-General 2011).

Hence, the internal auditing in the public sector make a vital contribution to public service institutions' compliance with laws and regulations and to the effectiveness of said institutions' internal controls, risk management, and governance processes (Office of the Accountant-General 2011). *The role of internal audit in the public sector* can be summarized as follows:

## Risk Management

Risk management is a key responsibility of management. Internal auditors should assist both management and the audit committee by examining, evaluating, and reporting on the adequacy and effectiveness of the risk management process. Risk management includes the identification; assessment; prioritization; and mitigation of risks affecting the public sector serve delivery. Internal auditors assess the adequacy of corporate governance and the control environment; the effectiveness of processes to identify, assess, and manage risks; the assurance provided by control policies, procedures, and activities; the completeness and accuracy of information and communication systems and practices; and the effectiveness. For instance, some public sector risks involve the political and economic consequences of the public's perception of fair and equitable treatment of citizens, animals, the environment, and others.

### Responsibilities of Internal Audit in Risk Management Include

- Providing assurance that the risk management culture in the institution is an appropriate one.
- Providing assurance that the risk register is an appropriate reflection of the risks facing the institution.
- Providing assurance that risk management is carried out in a manner that benefits the institution.
- Providing assurance that the risk management strategy, risk management implementation plan, and fraud prevention plan have been effectively implemented within the institution.

## Control

The establishment and operation of internal control systems is the responsibility of the relevant managers in the public sector environment. Internal auditor assists senior management in assessing compliance with laws and regulations and organizational policies and procedures. It does so by evaluating the existing controls in terms of their adequacy and effectiveness, assessing the change in the likelihood of any risk materializing, and developing recommendations for their improvement. These recommendations should always add value.

### Governance

Governance requires that the internal auditors assess and make appropriate recommendations for improving the governance processes for:

- Promoting appropriate ethics and values in the organization
- Ensuring effective organizational performance management and accountability
- Communicating risk and control information to appropriate levels in the organization
- Coordinating the activities and communicating information to the board of directors, external and internal auditors and management (Institute of Internal Auditors 2012).

The role of the internal audit with respect to good governance should be to assist the organization in achieving its goals, creating and maintaining particular values. It does so through the appropriate accountability and by evaluating processes that contribute to the achievement of these goals and values, specifically the communication of the goals and values and the processes used to monitor their respective achievement (National Treasury 2009).

#### The Significance of Internal Auditing in the Public Sector

- It provides unbiased and objective assessments of whether public resources are responsibly and effectively managed.
- It detects non-compliance with laws and regulations in the public sector.
- It provides public expenditure management system and should ensure that public spending is within budgetary provisions.
- It assists management to improve service delivery and ensure compliance with applicable laws, provide independent and objective assurance to an organization's management that its risks are being mitigated to an acceptable level and reports where they are not.
- It assists management in performing value for money audits such as the audit of economy, efficiency, and effectiveness

The scope of internal audit activities may include assurance and consulting projects. Assurance and consulting projects differ in many ways: Assurance services assess evidence relevant to the objective against defined criteria, while the consulting services provide advice upon request and the use of defined criteria does not necessarily form the basis of the advice.

Internal audit renders a variety of services to the organization within which they operate (Anderson 2003: 98), which includes assurance and consulting services:

**Assurance services includes:**

- Effectiveness of governance processes
- Risk management system
- Internal control system

For example, assurance services in the public sector are those services that require internal auditors to assess the adequacy and effectiveness of controls encompassing the organization's governance, operations, risk management, and information systems.

**Consulting services includes:**

- Improve the internal control system
- Support other (ad hoc) strategic important activities

For example, consulting services involve two parties, namely, the person or group offering the advice (the internal audit) and the person or group seeking and receiving the advice (the customer).

## Comparative Role of Internal and External Auditing in the Public Sector

| Role of internal auditor | Role of external auditor |
|---|---|
| Internal auditors independently work within the public sector environment | External auditors working for public sector are independent of the public institution environment |
| They report to the audit committee in the public sector | They accountable and report to the parliament |
| The work of internal audit is continuous based on the | The work of external auditors in the public |

(continued)

| Role of internal auditor | Role of external auditor |
|---|---|
| internal control systems of the public sector. They help public sector managers in ensuring that policies implemented for risk management are operating effectively | sector is periodic based on the audit of financial statements and on a test basis to monitor systems in place |
| Internal auditors are appointed by the management along with the audit committee, and they are the employees in the public sector | External auditors are appointed by the parliament after the discussion in the National Assembly for a fixed term of between 5 and 10 years to run the institution |
| Senior management set the objectives for internal audit work and approve them in the internal audit charter alongside the audit committee | The objectives of external auditors in the public sector are defined by constitution and the public audit act 25 of 2004 |
| Internal auditors in the public sector usually look at the risks of service delivery facing government objectives and how the public sector is managing those risks effectively. It provides recommendations for improvement across all government institutions | External auditors focus on the audit of finances, compliance with laws and regulations and the audit of predetermined objectives. The audit is designed to show whether there are true and fair use and reflection of public resources |

## Conclusion

Audit role is much broader. This chapter focuses on comparative roles of external and internal auditing as it is important to understand these implicitly before looking too closely at specialisms or niches. The external auditors are important towards promoting public confidence and trust in financial information. While the Internal auditors pay their attention on the systems and processes of an organization and reports on how they are working. They act as consultants to the organization by providing both assurance and consulting services on the organizations risk management, governance, and internal control processes. The comparative role of auditing in the public sector administration was put briefly in order to understand why South African public sector has implemented two form of auditing.

In South Africa, the public sector auditing is performed independently and the role and duties are set out in the regulations and the Constitution of the country. Through these audits ensures transparency and accountability in all government institutions' service delivery efforts. That South Africa is a democratic state and manages its affairs within the principles and requirements of its Constitution.

# Comparative Studies

Mario Coccia[1,2] and Igor Benati[2]
[1]Arizona State University, Tempe, AZ, USA
[2]CNR – National Research Council of Italy, Torino, Italy

## Synonyms

Comparative analysis; Comparative approach

## Definition

Comparative is a concept that derives from the verb "to compare" (the etymology is Latin *comparare*, derivation of *par* = equal, with prefix *com-*, it is a systematic comparison). Comparative studies are investigations to analyze and evaluate, with quantitative and qualitative methods, a phenomenon and/or facts among different areas, subjects, and/or objects to detect similarities and/or differences.

## Introduction: Why Comparative Studies Are Important in Scientific Research

Natural sciences apply the method of controlled experimentation to test theories, whereas social and human sciences apply, in general, different approaches to support hypotheses. Comparative method is a process of analysing differences and/or similarities betwee two or more objects and/or subjects. Comparative studies are based on research techniques and strategies for drawing inferences about causation and/or association of factors that are similar or different between two or more subjects/objects. In general, all investigations of cause-effect and/or of association between variables are, by nature, comparative studies. In particular, comparative studies in social sciences seek to analyze the combination of constants and variability that characterizes elements, structures, systems, processes, and policies, considering the global, national, regional, and local contexts within which they operate to show similarities and/or differences.

## Levels of Analysis in Comparative Studies

Comparative studies in public administration and political research can be arranged along a continuum that runs from the *macro*- to the *micro*-level of analysis (cf., Levine et al. 1990).

- At the macrolevel: Comparative analysis focuses on fundamental questions of government, of the public sector, etc. between and within countries by using aggregate data. It can focus on administrative structures, effects of government interventions on social stability, economic growth, the legitimacy of public authority, etc. In this case, it is important to control different socioeconomic factors between states to create a comparable framework. This level supports analysts for macropolicy processes that involve large-scale efforts to shape society over an extended period (e.g., major tax policies).
- At the microlevel: Comparative analysis investigates issues regarding administrators, certain resources, personnel, money, equipment and facilities of institutions, how personnel and institutions behave, and why, etc. This level supports analysts for public management decisions that have a small impact over a short time (cf., Coccia and Rolfo, 2007, 2013).

## Typologies of Comparative Studies

Peters (1998, p. 9ff; cf., Peters and Pierre 2016) suggests five types of comparative studies in political research:

(1) Single country descriptions of politics in X, whatever X may be.
(2) Analyses of similar processes and institutions in a limited number of countries, selected for analytic reasons.
(3) Studies developing typologies or other forms of classification schemes for countries or subnational units, using these typologies both to compare groups of countries and to reveal something about the internal public policies of each political system.
(4) Statistical or descriptive analyses of data from a subset of the world's countries, usually selected on geographical or developmental grounds, testing some hypothesis about the relationship among variables within that "sample" of countries.
(5) Statistical analyses of all world countries attempting to develop patterns and/or test relationships across the entire range of political systems.

## Techniques for Comparative Studies

Comparative studies can be performed using many techniques and the section here examines three major methods: case study, focused comparison, and statistical analysis (Hague and Harrop 2004, pp. 69–85).

### Case Study Method

In general, all scientific research is a case study because there is some units, or set of unit, in relation to which data are collected and analyzed. The case study is a specific type of scientific inquiry, which contrasts with two other kinds of social research: the experiment and the social survey. Case study research is related to the number of cases investigated and the amount of detailed information that the researcher collects. The fewer cases investigated, the more information can be collected. The case study subject in comparative approaches may be an event, an institution, a sector, a policy process, or even a whole nation. The case study, frequently, implies the collection of unstructured data and a qualitative analysis of those data. Case study research may be a basis for generalization or for theoretical inference of some kind about similarities and/or differences among the phenomena under study (cf., Gomm et al. 2000).

Case study research can be performed in five ways (Gomm et al. 2000, passim):

1. *Configurative-idiographic studies*, in which the material is largely descriptive. They may provide insights into the relationships among the elements in the case study but do not lead to direct theoretical implications.
2. *Disciplined-configurative studies* are configurations of elements but the scholar does not look upon these as unique or "idiographic." The analyst endeavors to interpret these patterns in terms of general theoretical postulates.
3. *Heuristic case studies* are different from the previous ones and they are deliberately chosen in order to develop theory.
4. *Plausibility probes* are case studies used specifically to test interpretative paradigms that have been established either by previous case studies or by other procedures. Plausibility probes may be undertaken after heuristic case studies have been successfully concluded. They may be directed to the expansion and development of an interpretative schema. Overall, then, plausibility probes are used as a preliminary test of theoretical formulations previously established by some other procedures, before a rigorous test performed through formal procedures.
5. *Crucial case studies* are similar to crucial experiments in natural sciences. They enable analysts to reject some theoretical proposition or to support it when the circumstances appear to be stacked against it. Detailed critical cases will then enable the analyst to relate events to theoretical propositions.

The role of case study research for theory and theorizing is of paramount importance and provides the means through which fundamental problems in specific research fields, such as public bureaucracy, may be approached and general inferences may be drawn from them.

### Focused Comparisons

Focused comparisons are a method between the case study and statistical analysis. They are based on a small number of studies focusing on the investigation of one aspect of public administration (e.g., bureaucratization, electoral system, etc.) in a small number of institutions/countries/etc. The number of institutions/countries/units can be either two, a binary comparison, or three, a triangular comparison. The emphasis is on the comparison at least as much as on the cases; otherwise, the research design would be a multiple case study. Countries/institutions and other subjects/processes/policies are normally selected to introduce variation into the dependent variable, thus overcoming an inherent limit of the single case study.

Focused comparisons have proved to be the success story of comparative politics (cf., Hague and Harrop 2004). Like case studies, they are sensitive to the details of particular countries, institutions and/or policies but, in addition, they demand the intellectual discipline inherent in comparative studies. The dimensions of comparison must be addressed, similarities and differences identified, and some effort made to account for the contrasts observed. However, focused comparisons remain sensitive to historical paths. Finally, a common strategy in focused comparisons is to select countries/institutions/processes/etc. which, although differing in the factor under study, are otherwise similar.

### Statistical Analysis

In contrast to the methods just mentioned, a statistical approach is based on variables rather than cases. Specifically, the goal is to explore the covariation among variables. These variables are usually measured on a quantitative scale, but it is also possible to draw up tables based on qualitative variables. The data can be: *time series*, the information is collected at regular intervals of time; *cross-section* data are obtained by taking a sample of individuals, institutions, sectors, governments, countries, etc. and collecting information over the short term (e.g., one year).

Statistical techniques may include descriptive statistics, statistical inference, and relationships among variables (Cooksey 2007).

1. *Descriptive Statistics*. In many comparative studies, large quantities of numerical data are generated. Comprehension can be aided by means of tabulation, grouping, and graphical representation of the data and also by developing summary statistics, which can be used to show particular features of the data that are of interest for statistical analyses.

   The representative values of the data are: (a) the *arithmetic mean* $\overline{X}$ is defined as the sum of the values of observations *Xi* divided by the number of observations $N$, $\overline{X} = \frac{1}{N}\sum_{i=1}^{N} X_i$; (b) the *median* (M) is the value of the variable which divides the data so that half of the values are less than and half greater than the arithmetic mean, $if\ i = 1, \ldots, m = 50, \ldots, N = 100,\ then\ Median\ (M) = \frac{X_{(m)}+X_{(m+1)}}{2}$; (c) The *mode* is the value of the variable which appears most frequently among the data. If the observations are 1, 1, 2, 3, 3, 3, and 4, the mode is 3.

   *Measures of dispersion*: (i) The *range* is the simplest measure of dispersion, defined as the difference between the largest and smallest observation; (ii) The *quartile deviation* (Q.D.). The $Q_1$ is the lower quartile, so that 25% of the observations lie below this value, and $Q_3$ is defined as the upper quartile, so that 25% of the observations lie above this value. The quartile deviation is defined as: $Q.D. = \frac{1}{2}(Q_1 - Q_3)$; (iii) The *mean square deviation* (MSD) is defined as $MSD = \sqrt{\frac{1}{n}\cdot\sum_{i=1}^{n}\left(X_i - \overline{X}\right)^2}$.
2. *Statistical inference.* In some situations, synthesizing large quantities of data may represent

the object of the statistical analysis but, in other cases, it may be the first step in the study. The main characteristic of statistical inference is to show something about a population on the basis of incomplete data, in the sense that the study only examines a sample and not every member of the population. The underlying theory involves probability directed to the estimation of population mean, of population variance, of population proportions, as well as hypothesis testing (concerning population mean, population variance and population proportions; and the difference between two population means, among population variances – $F$ test – and between two population proportions). These statistical techniques are applied to solve problems of estimation and hypothesis testing with a single variable (or multiple variables), using statistics software, such as SPSS, R-Studio, etc. (Cooksey 2007). When a scholar performs a statistical test about the hypothesis, a *p-value* determines the significance of results. Statistical tests, such as T-test, are used to test the validity of a claim, called null hypothesis, that is made about a population.

3. *Relationships among variables*. Now the discussion is extended to consider estimation and hypothesis testing when there are relationships among two or more variables. This statistical analysis can be performed with correlation and/or regression analysis. The simplest possible case involves only two variables, $X$ and $Y$. *Correlation analysis* does not specify the direction of causality between $X$ and $Y$ and provides a measure of the degree of association among observations $xi$ and $yi$ ($i = 1, \ldots, N$) with the coefficient of correlation, $r$, defined as: $r = \frac{\sum x_i y_i}{\sqrt{\sum x_i^2 \cdot \sum y_i^2}}$; If the scholar specifies the form of the relationship between X and Y (for example, a linear relationship $Y = \alpha + \beta X$), the estimation of parameters is performed through a simple regression analysis. The relationships to be investigated are often suggested by the theory. The discrepancies between the empirical data and the relationships suggested by the theory are in errors of measurement (errors in variables) and errors in equations. These errors are denoted as $\varepsilon s$ in the equation (model).

The relationship of variable $Y$ as a linear function of a single variable $X$ is given by:

$$Y_i = \alpha - \beta X_i + \varepsilon_i$$

*i(observations)* = *1, …, N;* $\alpha$ and $\beta$=parameters; $\varepsilon$=error term.

The random errors $\varepsilon_i$ indicate the *unobservable*. The estimation of parameters in socioeconometric models can be performed with the least squares method (LSM), which gives:

$$a = \overline{Y} - b\overline{X}$$

and

$$b = \frac{\sum (Y_i - \overline{Y}) \cdot (X_i - \overline{X})}{\sum (X_i - \overline{X})^2}$$

This analysis can be extended to deal with more than one explanatory variable (multiple regression analysis) and with nonlinear relationships (see, Cooksey 2007).

4. *Multivariate approach (parametric and non-parametric)*. In modern computer-aided analytical studies, scholars usually obtain a great quantity of data about phenomena and it is important to extract the information from such an amount of data. To summarize and represent the interrelationships among a set of variables, scholars can apply the *principal components analysis*, which attempts to accomplish this task by explicitly combining variables in a weighted fashion to form "components" accounting for the maximum amount of variability in the variables' scores.

In comparative studies, it may also be important to form homogenous groups of either observed respondents in a sample or, less commonly, variables in a sample based on the extent of similarities or dissimilarities among them. *Cluster analysis* refers to a collection of statistical procedures designed to cluster variables into homogenous subsets of

an entire sample. In *nonhierarchical cluster analysis*, the grouping occurs in a single iterative stage, where a specific number of clusters is identified, and all cases are classified into the cluster they are most similar to. In *hierarchical cluster analysis,* the grouping process occurs using a sequence of merges, where each merge joins the two most similar entities into a cluster using a specific mathematical algorithm; the merging process continues until all entities have been successfully grouped into one large cluster. The distinctive outcome of the hierarchical clustering process is a tree diagram or dendrogram, which traces the history of all of the merges. The most widely employed hierarchical clustering algorithm appears to be Ward's method (Cooksey 2007).

## An Application of Comparative Study

The comparative study by Benati and Coccia (2017) applies statistical methods to shed some empirical light on the relationship between the system of governance of countries and high public office compensation with cross-section analysis based on of the Organisation for Economic Co-operation and Development (OECD) countries.

This study measures governance as the capacity of the government to effectively formulate and implement policies by using: (a) government effectiveness; (b) regulatory quality; and (c) other indicators, such as the indices of voice and accountability, rule of law and corruption control.

In this comparative study, the compensation of senior managers is measured as the annual compensation of central government senior managers in country *i* divided by the Gross Domestic Product (GDP) per capita of country *i* to create a homogenous framework among countries. The sample is made up of 20 countries.

Hierarchical cluster analysis using Ward's linkage with the variable of government effectiveness generates three groups of countries that are compared through arithmetic means and standard error of mean (Table 1). Group A (Greece, Italy, and Poland) has a high average level of the ratio (annual compensation of central government senior managers/GDP per capita) – i.e., $26.45 – associated with low levels of governance indicators. Group C includes countries

**Comparative Studies, Table 1.** A comparative analysis of groups of countries generated by hierarchical cluster analysis based on government effectiveness by Benati and Coccia (2017)

| Group | Descriptive statistics | Ratio: annual compensation of central government senior managers 2011/GDP per capita PPP constant 2005 year (y) | Governance indicators | | | | |
|---|---|---|---|---|---|---|---|
| | | | Voice and accountability | Rule of law | Corruption control | Government effectiveness | Regulatory quality |
| | | | 2004 y | 2004 y | 2004 y | 2006 y | 2006 y |
| A | Mean | 26.45 | 1.15 | 0.63 | 0.42 | 0.50 | 0.76 |
| | Std. error of mean | 8.02 | 0.03 | 0.11 | 0.13 | 0.07 | 0.06 |
| B | Mean | 13.23 | 1.26 | 1.00 | 1.05 | 1.07 | 1.07 |
| | Std. error of mean | 1.49 | 0.07 | 0.14 | 0.15 | 0.05 | 0.08 |
| C | Mean | 11.46 | 1.61 | 1.78 | 2.08 | 1.85 | 1.58 |
| | Std. error of mean | 1.73 | 0.05 | 0.05 | 0.09 | 0.07 | 0.05 |

*Groups*: (A) Greece, Italy, and Poland; (B) Portugal, Slovak Republic, Estonia, France, Slovenia, and Spain; (C) Belgium, USA, Austria, Germany, The Netherlands, UK, Australia, New Zealand, Sweden, Finland, and Denmark

with good governance associated with lower levels of the ratio (annual compensation of central government senior managers/GDP per capita). This comparative study suggests a possible relation between governance of countries and the rewards system of public managers (cf., Benati and Coccia 2017).

To check the generalizability of the results of this comparative study, a correlation analysis is performed. The results suggest that the annual compensation of central government senior managers (standardized with GDP per capita) has a negative association with indicators of governance, represented by government effectiveness, regulatory quality, rule of law and corruption control.

Overall, then, this comparative study in public administration shows that, on average, high levels of compensation of public managers can be associated with bad governance of countries. On the contrary, countries with *low* levels of the ratio (annual compensation of central government senior managers/GDP per capita) seem to be associated with high freedom of expression, freedom of association, free media, and corruption control. In particular, this comparative study shows that public managers in Italy, Greece, and Poland have enjoyed the highest compensation levels (standardized with GDP per capita) compared to other OECD countries of the sample understudy. This result can be used for possible public reforms aimed at improving the efficiency of the public sector (cf., Benati and Coccia 2018). However, in this comparative study, it ought to be observed that high levels of compensation may also be due to cross-national differences in labor markets, laws of public contracts, power of trade unions, and remuneration of the private sector for comparable skills. Hence, in comparative studies, it is important to control different socioeconomic factors among countries for analyzing similar phenomena under study.

## Conclusion: Advantages and Risks of Comparative Studies

Comparative studies in public administration have some advantages because they improve the understanding of problems across different systems, provide classifications of different processes/subjects/objects, enable to test hypotheses, and provide information for predictions and control of phenomena for supporting best practices in public administration, public economics and management. However, comparative studies also have some weaknesses: comparative research demands knowledge of more than one system, the "same" cause can generate different effects in different systems, creating difficulties in comparing like with like. Finally, socioeconomic systems and public organizations differ across many factors because other things are often not equal over time and space; as a consequence, comparative studies in public administration cannot hold all factors constant, just like laboratory experiments, except the variables under study.

## Comparative Studies of Rural Women Employment

Razia Begum[1] and Bahaudin G. Mujtaba[2]

### Synonyms

Agriculture; Female income inequality; Poverty in rural areas

### Definitions

- *Rural women* are those females who are living outside of the cities and often work in family-owned lands alongside other family members to grow their crops for family consumption.
- *Rural women employment* refers to the percentage of females who are living outside of industrialized cities and working in agricultural sector to support their families.

### Introduction

Rural women make up a large percentage of the population in many developing countries. Rural women are those individuals who are living away from large industrialized cities and often serve as homemakers, mothers, farmers, caregivers, consumers, investors, entrepreneurs, and supporters of their family members.

As one example, we can see that the development of opportunities for women in South Asia's rural areas needs more attention, effort, and resources from both local and global leaders. Providing more opportunities for the nearly 50% of the population can lead to an overall growth and development of the nation. Lack of sufficient opportunities for women in rural areas is a serious threat because it manifests itself in a complex web that is interwoven with the issues of illiteracy, income distribution disparities, lack of access to facilities, defective polices, etc. Public leaders need to devote more time and resources for the strategic development of education and employment opportunities for all women and especially in rural areas. Accordingly, this chapter provides a review of the current status of women across the globe, analyzes some of the main challenges facing females, and proposes areas for employment development.

As stated by the former US President, Bill Clinton (September 2009), while addressing the annual meeting of the Clinton Global Initiative, women perform about 66% of the world's work and produce around 50% of the food, yet earn only around 10% of the income, while owning 1% of the property. Whether the issue is improving education in the developing world, or fighting global climate change that is impacting everyone, or addressing nearly any other challenge we face in this twenty-first-century environment, empowering women is a critical part of the equation.

Development of any nation is based upon the contributing hands of its population. Regardless of gender, human resource is an immensely important asset as they are the ones who make better use of other productive resources in numerous activities to attain circular flow in various economic spheres. Active labor force ratio serves as a strong measure to access any country's level of development as not only it represents the supply of labor available in a country at a specific point in time but it also helps in improving a

country's position on Human Development Index (HDI). The milieu of globalization drives countries to employ their population in a more productive and efficient way, yet safeguard their rights and well-being along with their socioeconomic uplift. The objectives of this writing are as follows:

- To understand significance of women employment
- To identify factors affecting women employment
- To highlight women contribution ratio globally and regionally
- To identify the problem areas hindering women employment
- To suggest recommendations for better women employment

## Women Employment

Women employment is currently in spotlight, but it does not mean that she was not economically active before; in fact, throughout the mankind history, women worked side by side with men to earn their livelihood. But due to the changing world economic, industrial, technological, and social trends, female contribution has been recently noticed with more emphasis.

Despite other changes, one of the obvious global changes is increase in female labor force participation after WWII, and the trend is still continuing, albeit with differences in speed between developed and developing nations. Advantage of women participation in economic activities gets reflected in social, familial, and educational fields. Not only the economy benefits from its aggregate citizens but also the household income distribution gets balanced.

By labor force participation, economists mean both men and women of the country. However, across the globe, labor force participation pattern is not in symmetry with population ratio. Women work is a complex phenomenon for which numerous sociocultural, economic, educational factors at global, local, and domestic levels need to be taken into consideration before arriving at the final picture**.** Impact of the changes (Table 1) could be seen on every area differently. As for rural women, these changes present a mix of outcomes, for some it brings more opportunities but for others more marginalization.

**Comparative Studies of Rural Women Employment, Table 1** Factors affecting women employment

| Issues | Dimensions/features |
|---|---|
| Global/ regional | Climate change, economic policies, trade policies, peace situation[a], availability and level of utilization of natural resources, liberalization of trade, more use of information and communication resources, privatization[a], establishment of agro-based industries |
| National | Economic policies[a], trade policies[a], natural resource utilization, climate, law and order situation, openness to foreign investment programs, peace situation[a], financial assistance services, skill-based trainings, type of government, bureaucratic structure, availability of up-to-date and accurate data, cultural norms, religious practices, openness to innovation, level of implementation of polices, literacy rate, acceptance of females in certain employments[a], privatization[a] |
| Local/ domestic | Family income, no. of family members, family life cycle stage, skills, infrastructure, ease of mobility, access to markets, cultural norms[a], religious practices[a], level of technology, tribal and caste system, health and safety awareness, dignity of labor, acceptance of females in certain employments[a], job of husband, ownership and access to productive resources |

[a]Factors existing on multiple levels with different impact on rural life

## Comparative Global View

Progress can be seen in education in later half of the twentieth century which equips women with skills and knowledge coupled with progress in industry and technology which produce more job opportunities that are supposed to be reflected in female labor force participation progress. If we look at the aggregate sex-based employment ratio globally, we see a gender gap in the women employment participation. Most of them in Asia

and Africa contribute in family work which is unpaid job, followed by a narrow span of own account workers which is a low paid option too. Resultantly, her economic status, health, family well-being, and empowerment remain in jeopardy. On the other hand, if she joins any wage/salaried jobs, even they pay her low and the job she performs is mostly manual.

A snapshot of female employment won't be explanatory in all areas of progress and trends; thus, studying women workforce ratio in a time series (1995–2015) is helpful to trace out some visible changes not only in relation to male workforce but to her own participation ratio. It can be seen that developing and underdeveloped countries rely heavily on agriculture sector for their economic sustenance, where jobs are mainly labor intensive and poorly compensated. Agriculture remains prominent female occupation in these regions, where she dominates total workforce ratio, not only in 1995 but also in 2015. Although women participation in agriculture showed a slight decrease in 2015, but still she outnumbered the male population.

Merely women participation is not the complete picture, as the quality and productivity of it matters too. Overall jobs are unequally distributed, even in developed countries where their gender gap in labor force participation is very low. This gap widens more and more in developing countries and in its rural areas. With economic growth countries tend to shift from agriculture to industry and services sector. But for women this movement is very slow.

To understand why females remain behind in paid jobs even if she has the required skills and education, we need to study where she spends most of her time. Both in developing and developed countries, females spend most of their time performing household responsibilities which limit her capacity to dedicate more time to formal, paid jobs. This is the biggest unaccounted side in considering female labor force participation rate regionally and globally. Stakeholders need to shift their attention to this side of women participation where she provides dedicated services to household tasks and society at large. In reality, she works more hours than men if we consider her paid and unpaid time together.

## Dimensions of Women Employment

As a whole, employment is a base point for a female's personal, familial, and national development at large. Female employment is in a direct relationship with poverty alleviation, social well-being, and improving a family's standard of living. However, female employment is fruitful if it provides the opportunities to learn, grow, and earn. If conversed, then the same employment becomes the source of her exploitation. To better grasp the idea of female employment, we will look into various dimensions (economic, geographical, and sectorial, as presented in Fig. 1) which help to make women employment more classy, its prospects, and unique challenges in the subsequent section.

**Comparative Studies of Rural Women Employment, Fig. 1** Economic, geographical, and sectorial dimensions of employment

### Economic

The rationale for women employment is quite abstract, sometimes she has been driven to employment by poverty while at other times due to an opportunity for better life standards. Thus, we cannot make generalizations about why women work, choices of work, and what reasons propel her to join formal work.

However, if we look into the women employment trends from the perspective of the gross economic level of development, we see that the drivers of women employment in developed nations are far different than the women employment in developing and underdeveloped ones. Some of the possible reasons for these differences are that developed nations possess more opportunities, better mobility, access to economic resources, variety in employment choices, credit availability, better literacy, broad services sector, and established policies. On the other hand, developing and underdeveloped nations have characteristic features of poverty, illiteracy, limitations on female mobility, lack of policies, unstable bureaucratic structures, under- or no utilization of resources, low paid jobs, excessive manual labor, as well as lack of technology and infrastructure.

It will not be wrong to say that developing countries will benefit more from female employment than the developed ones. For these countries it means their overall human development rather than mere economic growth. This enables their nations to embark their efforts in more high developmental objectives.

### Geographical

Geography discusses female employment in terms of location, i.e., urban and rural. Almost half of the world population is female, which constitute one fourth of the population of rural women. This demarcation is very important in order to understand the unique challenges confronted to females belonging to different regions. Urban and rural female even within a single country, despite of having similarities, still have different lifestyles, thus faces unique challenges. Statistics show that rural women hold greater share of the household chores than urban women. And, she also faces more constrains than urban ones. Studies show that almost two thirds of developing countries employed rural women in vulnerable jobs, mostly agriculture based, which are either unpaid or very low paid.

There is no doubt that the world is becoming a global village in terms of trade, mobility, and communication. International trade has become a leading source of national income. To compete globally every country is striving to get maximum output with minimum input by mechanizing every sector of their economy. But these economic and trade reforms do not benefit all citizens alike. Particularly in rural areas where women are the major labor force, they are somewhat negatively affected in a way that when occupations like agriculture get mechanized in rural areas, they become taken over by males. Secondly, when more industries are established, it shrinks agricultural land. Resultantly, the female worker has a narrow job scope as she often has no prior education or skills training to use technology and more mechanized ways of production or to join industrial jobs.

### Sectorial

Globally, economies could be classified as either production (agriculture and industry) or service oriented. Developed nations earn much of their GDP from services and industrial sector, while developing and underdeveloped nation's major GDP is derived from agriculture sector followed by industry. In rural areas where industry is not developed to the fullest and other employment opportunities are limited too, the options for female employment are to either work in agriculture and its allied fields or join industry work as a laborer. Despite of endeavoring to create and develop opportunities for females in every field, there is still a "gendered pattern" in employment. This pattern becomes more visible if we look into the fields deeply, for instance, the concentration of rural female in agriculture field. Very minor ratio of rural females consider entrepreneurship, if backed by favorable atmosphere needed for entrepreneurial venture.

### Agriculture and Allied Fields

Agriculture is believed to be the backbone of all developing and underdeveloped countries, and females in turn are the backbone of agriculture. Rural areas are predominantly agrarian, and whenever there is agriculture, women will be definitely seen there in the active labor force. Females dominate agriculture to the extent that in Asia and Africa almost 80–90% of agriculture labor force are women. Agriculture not only provides food and sustenance to the masses but also supplies raw products to the various industries. Rural females are employed not only in the fields but in a variety of pre- and postharvest, as well as other allied activities to supplement agriculture performance.

Most agricultural workers' tasks are from dawn to dusk, manual, and an addition to her household responsibilities. Generally she could be seen contributing to the following fields:

- Food conservation
- Harvesting
- Postharvest storage
- Fisheries
- Livestock
- Poultry farming
- Growing and collecting animal feed
- Growing vegetables

### Industry and Services Sectors

The motive behind rural female work is to supplement her husband's income, overcome poverty and hunger, and if possible to educate her children. In industry, the female worker is usually engaged in such jobs which require minimum skills. Rural areas have immense talent which is reflected in many handicrafts the workers produce with so much artistic delicacy that it become the identity of that area. Most of the female workers produce handicrafts which they sell in nearby markets or to "middle men" for not a comparable worth of their time and effort. Some females work in cottage industries and small-scale industries located in their areas.

As far as services sector is concerned, she is serving mainly in elementary occupations. According to International Labor Organization (ILO), elementary occupation broadly includes the following:

- Cleaners and helpers
- Agricultural, forestry, and fishery laborers
- Mining and construction labor
- Manufacturing laborers
- Transport and storage laborers
- Food preparation assistants
- Household caregivers
- Street and related sales and service workers

As it is evident from the above list that her job is either unskilled or semi-skilled and of seasonal or part-time basis, thus could not pay well or equivalent to her tiresome efforts.

## Striving for Better Future Women Employment

Global researchers have inquired enough into women contributions to world economies and their underprivileged status (Abdelali-Martini 2011; Adeniyi 2010; Aderinto, 2001; Agricultural Development Economics Division: The Food and Agriculture Organization of the United Nations, 2011; Asian Development Bank, 2015; Benefo and Pillai, 2003; Davis, 2011; FAO, 1998; Hyder, Behrman, and Kenan, 2014; ILO, 2016; Mujtaba, 2014; Romero-Paris, 2009; Sivanesan, 2014; Yasmeen, Begum, and Mujtaba, 2011; UN Women, 2015; UN Women, 2017; UN Commission on the Status of Women to Be Highlighted, 2012; United Nations, 2000; Women's economic empowerment, 2012). This is the time when they should focus on finding and implementing solutions to get her out of her obstacles. Customary active labor force ratios only show a narrow picture of women employment; thus, females are those invisible hands whose efforts are not fully acknowledge yet. To overcome this underestimation, we need to focus on the shadowed areas, bring up more accurate and up-to-date data to base future policies on it. For this initiative, multi-sector efforts are needed at least in the following areas:

(1) *Investment in female education.* Education is the key to multiple doors of progress and development. If we want to have a long term, sustainable development, we need to invest in education, particularly female education. She is not only contributing to the economy by working in different fields but she is also in charge of home and next generation too. Education has proven to be positively contributing in enhancing female decision-making power and increase better employment choices. If the government is in transition from production to services economy, then they need to make their labor force ready, and education is the only means to do it. Government needs to take rural female education as a priority and make at least primary education free and of great quality standards. New schools are needed so females who are unable to get enrolled due to nonavailability of schools in close areas will also be able to get an education. Scholarships and various incentives for talented students could be introduced to make education more rewarding and motivate the locals to enroll their children into schools.

(2) *Educating stakeholders.* Stakeholders of the society also need to be educated as to make them realize the significance of women's role, which goes unnoticed. Policy makers, economists, civil bureaucrats, legislators, researchers, donors, employers, etc. should have a clear vision of women's share in labor force, unique field-related problems, and constrains they face. Only then they will be able to develop and implement polices of practical value which could truly transform women's status. Policy makers should consider the gendered pattern while devising polices. Her special needs regarding her household responsibilities and child rearing should be taken into consideration. For researchers, while considering global statistics, unpaid family work and its significance for keeping families intact should be taken into consideration.

(3) *Skill-based trainings.* If the world really wants to benefit from the latest technological explorations, then they need to deliver it into the hands that really work at the grass roots level. In such a scenario, skill-based training tailored to her work and timing profile is indispensable, as it will enable her to use modern technological tools, equipment, and process confidently to enhance productivity and efficiency. In this regard women could be taught through informal vocational, need-based trainings and even home-based extension services. Before devising any training programs, all those activities in which women are primarily engaged should be kept in view to organize a relevant program.

(4) *Finances on easy terms.* In rural areas women have no access to national financial institutes for credit and other services support. In case if she has access but not the knowledge to avail the most suitable service of her benefit, financial advisory bodies are needed to be developed in rural areas to advise women on how to access any financial institutes for assistance and how to get services which better suits her needs and repayment ability. Countries need to develop short-term loans on easy terms, divide the installments in small, easy payable chunks, and diversify grants to support employment in other fields other than agriculture. In addition to direct finance, indirect investments are needed in the areas which could benefit rural women's life such as develop better infrastructure, water facilities, sanitation, schools, and basic health units.

(5) *Small- and medium-scale industries.* To diversify population occupation and to control overrepresentation of females in agriculture, countries need to set up industrial units in their rural areas. It does not need to be huge projects, as small-scale industries would be a viable idea. This will provide more employment opportunities, improve earnings, make better use of technological equipment for better productivity and most importantly will control migration to cities in search of better jobs. Thus, it would give a balance development to all citizens. Government and donor agencies could work on

promoting and facilitating rural entrepreneurship, provide cottage industries where women could work by utilizing their skills, establish industrial zones, and make free trade areas available. This will provide a chance to rural population to nourish their small businesses.

(6) *Accurate data collection/applied research is needed.* Providing support to the rural women is indispensable in getting her out of poverty and exploitation. Researchers and development planners need to understand and consider the true position of women not only in agriculture but in every field in terms of formal and informal contribution they make. They need to record weighted data regarding her unpaid household contributions which has been grossly neglected so far. Her major work has remained underreported statistically due to the narrow definitions of economic contribution.

Secondly, researchers need to collect regional and local data before drawing any conclusions and make policy recommendations for a particular area. As every region within the same country has different employment scenarios, so generalization based on one sample data will not always bring promising results. We need more of applied researches today as to translate those research findings into practical implications. Not only the research at one point of time but its follow-up is equally important to track the improvements.

(7) *Encouraging adoption of new technologies.* Female productivity could only be improved if she is assisted to use relevant and updated technology in her work. The benefit depends on the resource distribution and control pattern in rural areas. The developers and donors have to first fix the gendered pattern of work in rural areas before they introduce any technology. Women could benefit from any improvement in seed type, pesticides, storage methods, preservation techniques, and advance poultry farming techniques. This way, not only women will be more productive but her performance will also positively affect her socioeconomic status, children, and their overall living standard.

(8) *Develop sources of energy/water supplies.* Government should ensure the supply of latest energy sources to the rural areas as to make their work easy and efficient. Most of the rural areas are deprived of water, electricity, gas, and other energy resources; resultantly, they survive on very basic sources like collecting wood for fuel and bringing water from far flung areas which have primarily been a female job and wastes a lot of her time. Also, having ample energy and water resources will improve their standard of living, save time, increase their work efficiency, and enhance productivity.

(9) *Ownership rights.* Women holding any economic resources in ownership are often little to none, albeit she is working on it for her whole life, particularly land ownership, in which she has been denied to have ownership rights due to sociocultural norms and other caste and race constrains. Women resources and services ownership is the single major issue to be addressed by the policy makers. She could only benefit from any national or social reforms if she has ownership to it. Moreover, this will provide her socioeconomic security and uplift her status.

(10) *Dignity of labor/develop dignity of labor in the tasks she performs.* Women's contributory status needs to be recognized on every level. Nations have to realize that she is half of the global labor force; therefore, she needs recognition, benefits, and protection in her job. We need to acknowledge the role she performs whether paid or unpaid which has remained unappreciated till date. Jobs creation is not enough; it should be at the same time productive, profitable, and with safe working conditions with ample provisions for her well-being.

(11) *Culturally acceptable work styles/timings.* Culture exhibits a general way of living of the population in any area. Culture is a prominent feature affecting the type and timings of profession and mobility options of females. Cultural norms manifest itself in

many forms like caste, locality, tribe, and religious norms. Somehow, these norms can hinder a woman in entering the occupation of her choice, even though she is all ready and qualified, simply due to cultural boundaries imposed on her gender. The development strategists should consider these factors while designing, creating, and offering jobs for rural females; they have to work within the limits of that culture. Otherwise, their plans for female workforce will not bring fruitful results.

(12) *Mobility arrangements*. In rural areas women have problems with having means of mobility, which limit their ability to go to work every day and back home on time. Therefore, not only creating job opportunities are important but equally important is to consider how they will move daily in culturally acceptable timings of the day. If she is working in any services field or industrial unit, then it should be the employer's responsibility to make some provision for her mobility.

## Conclusion

Females of any nation are likely to make up around half of the population, but sadly many of the women in rural areas still remain uneducated and lack proper opportunities for their personal development in many countries, especially in South Asia. Consequently, the active labor force of every country should include close to 50% of females. This paper has shed light on better understanding the significance of women employment for economic development, identifying factors that affect women employment, highlighted women contribution ratio globally and regionally so local leaders can assess their workforce opportunities, and provided recommendations for the development of employment and educational opportunities for females.

# Comparative Theories and Causes of War

Mario Coccia
CNR – National Research Council of Italy, Torino, Italy

## Synonyms

Conflict; Disputes; Struggle

## Definition

War is a strategic activity of attacking using weapons and new technologies for resolving internal and/or international disputes or conflicts between two or more nations; between ethnic, social, and religious (organized) groups; etc., to cope with environmental threats and take advantage of important opportunities, generating at the same time a reduction of the freedom of other societies/groups and causing deaths, injured people, and/or social, economic, cultural, and/or ethnic damages.

## Introduction

Scholars have investigated the causes of war with different theories based on approaches of philosophy, history, psychology, economics, demography, sociology, biology, etc. (Ackoff and Rovin 2003; Coyne and Mathers 2011; Gini 1921; Levy 2011). Wars can be due to manifold *preconditions* (factors that set the stage for war over the long run) that trigger the conflict in the presence of *precipitants*, specific events that immediately precede the occurrence of war. In general, theories of the causes of war can be distinguished in traditional and modern theories (Fig. 1).

## Traditional Theories of the Causes of War

A general theory of the causes of war is difficult to design because of manifold factors involved in conflicts over time and space. Traditional theories focus on a disequilibrium of socioeconomic factors between nations and/or between different populations/societies that can lead to war. The most important traditional theories of the causes of war are as follows.

### Theory of No Economic Advantage from Wars

One of the most important theories about the causes and effects of war in society is by Norman Angell (1911), a lecturer, journalist, politician, and Nobel Peace Prize winner in 1933. Angell's thesis is that war does not generate any economic advantage for winners. The proof of this interesting theory is based on different points, as follows:

- When winners of war destroy enemy populations or seize their wealth, they damage themselves because they destroy commercial opportunities.
- If winners impose fiscal clauses to losers, winners also limit commercial opportunities for themselves, generating socioeconomic damages for both winners and losers.
- If winners decide of not imposing custom restrictions to losers but they implement a economic policy of free exchange in commerce, then winners have benefits, but at the same time, losers have also economic advantages that can be used to accumulate physical capital and support their human resources for a potential revenge, creating a continuous source of troubles for winners.
- If winners impose a war allowance, losers can increase money supply (production of physical currency and coin) to pay war debts, but this monetary policy of losers increases prices

**Comparative Theories and Causes of War, Fig. 1** Main theories of the causes of war

without increasing wealth, generating inflation in economic system and a variable unit of measure and rate of change of currency in commercial negotiations.

– If winners annex the territories of losers, then winners generate a simple change of governance and public administration that can create socioeconomic issues within these territories.
– If winners transform territories of losers in colonies, winners do not have any advantage because colonies may be sources of rebellion and/or internal wars; hence, winners have to increase public expense to maintain political stability and reduce social risks in colonies.

In short, the utilization of military force for resolving disputes between states and/or organized groups does not generate any economic advantage for winners and losers. This thesis by Angell (1911) has been confuted by some scholars, such as I. H. Jones (professor at the University of Glasgow in Scotland) in 1915 and Corrado Gini (1921), professor at the Sapienza University of Rome in Italy. However, today this approach by Norman Angell (1911) can be true because geoeconomic regions are a world system with indissoluble socioeconomic interrelationships among different nations based on interrelated bank systems and transportation, communication, and information systems. Hence, conflicts between countries and/or different societies that are elements of the same system can create only mutual socioeconomic damages. When all populations will know the uselessness of wars, the optimistic prediction by Angell (1911) is that wars may disappear,

such as religion wars. Unfortunately, from the 1910s, when Angell (1911) wrote his book, called *The Great Illusion*, many wars have occurred, and in the future other wars may occur and recur between nations that seem to be irrational subjects in the presence of environmental tensions and scarce natural and economic resources.

### Theory of War Based on Historical Causes

Yacov Novicow (1894), a sociologist of pacifist theory, argued that wars persist and repeat because of historical causes that generate an inertia force in society. This theory simply states that current and future causes of war are due to individual and social routines. This theory is, of course, a simple explanation of the reasons of war with many contradictions and weak empirical foundations.

### Theory of Natural Human Combativeness

Nietzsche, Gumplovics, Ratzenhofer, Steimnetz, and Mahan suggest another theory that is based on human combativeness. Although some policymakers and governments recommend pacifistic approaches, there are instincts rooted in human nature that can lead to wars and conflicts between organized groups. However, economic interests and costs of war seem to overpower, in some specific cases, the natural instincts of human combativeness in society, such that this theory does not provide a comprehensive explanation of the reasons of war.

### Theory of Biological and Sociological Necessities to Protect Nations from Decline

The difference between the theory of human combativeness and theory of war to safeguard some nations from decline is that the first theory considers human combativeness as a cause of war, whereas the second one considers human combativeness as an effect of war. This theory argues that struggles and conflicts are due to natural agents that increase the growth rate of population and reduce economic resources, generating social tensions between different groups and/or nations in specific geoeconomic regions (cf., Gini 1921).

### Theory of Psychological Diversity Between Populations

Another theory suggests that the causes of war are due to psychological and social diversity of populations in different regions. These possible reasons of war create intergroup hostility between societies with different identities based on common religious and cultural traditions (cf., Choma et al. 2016; van Bergen et al. 2015, Coccia 2017b). These causes are necessary but not sufficient conditions for explaining wars, because the diversity between populations is a permanent factor, whereas conflicts are intermittent events over the course of history. Moreover, these causes of war tend to decrease over time because of the reduction of heterogeneity between nations generated by a high mobility of people through faster and better communication and transportation means and by higher intellectual contacts.

### Theory of the Demographic Causes of War

This theory argues that states with a high density of population can pour out people in nations with scarce population and density (Gini 1921). This theory explains past wars between Germany and France that had a similar geoeconomic area, but France had a lower population and a lower fertility rate. In this theory, some scholars claim that the demographic pressure of a nation on another one is due to a disequilibrium between level of population and economic resources. In this context, Thomas Robert Malthus (1798) considered war as a repressive factor of the disequilibrium between population and basic goods. Neo-Malthusian scholars support this theory that the growth of a population associated with scarce essentials, natural and economic resources is a source of social issues (Gini 1921). In short, demographic causes of war are due to an imbalance between level of population and economic resources. In fact, according to this theory, a high level of population within nations – in the presence of shortage in basic goods and low economic growth – generates a disequilibrium, creating social issues with close nations having a high well-being and a lower density of population. This approach also argues that war can be due to an insatiable desire of some societies of further

supporting a growing national income. Overall, then, the causes of war can be explained here with high density of population associated with low growth of economic resources that negatively influences social relations and leads to deteriorated human functioning in specific geoeconomic regions (Altman 1975; Baum and Paulus 1991; Lepore et al. 1991). In order to synthetize a general theory of the causes of war, Gini (1921) states that wars or conflicts with weapons between peoples or between social classes are due to exasperation in all or some social classes, to human combativeness of specific populations, and to psychic diversity between populations. These factors oppose to the dynamics of various social elements to distribute themselves according to their natural expansion force in society.

## Modern Theories of the Reasons for Wars

### Theories of the Failure in Bargaining

Jackson and Morelli (2011) suggest two prerequisites for a war between rational subjects: *Firstly*, the costs of war cannot be overwhelmingly high, i.e., wars occur with rational actors if the gains from conflict will outweigh the costs incurred. *Secondly*, there has to be a failure in bargaining (cf., Fearon 1995). In particular, this approach suggests that war may occur with bargaining failures, which are given by:

- Asymmetric information about the potential costs and benefits of war.
- A lack of ability to enforce a bargaining agreement and/or a lack of the ability to credibly commit to abide by an agreement.
- The incentives of leaders differ from those of populations that they represent.
- Multilateral interactions where every potential agreement is blocked by some coalition of nations who can derail it.

In general, modern approaches argue that causes of war are due to a level of irrationality of subjects (Jackson and Morelli 2011). Religion, according to these approaches, can be a cause of war between different nations or ethnic groups. The goal might be to increase the size of population of one religion or eradicate another religion. In such situations, even with full commitment and bargaining opportunities, there might be no agreement that appeases an aggressor. That is, even if agreements are available and fully enforceable, agents are driven by a specific goal that may be incompatible with the well-being or autonomy of other populations or social groups. Revenge is another reason for conflict within the set of non-rationalist explanations of war. Another reason of war is to eliminate another ethnic group or minority ideological group with the goal to obtain a higher social power over time and space (cf., Esteban and Ray 2008).

### Theory of the Democratic Peace

The theoretical framework of democratic peace states that democracies rarely go to war. Scholars of this research field argue that democratic societies are averse to war because of the nature of democratic culture and also because citizens will not vote to send themselves off to war. Moreover, the norms of peaceful resolution of disputes within democracies are extended to interactions with other democracies (cf., Fearon 2011; Jackson and Morelli 2011; Levy 2011).

### Theory of Endogenous Power

Some theories explain the incentives of countries to arm and create wars (cf., Coyne and Mathers 2011). As a matter of fact, the probability of war depends on prior investments in arms, and incentives to arm depend on how arms affect future incentives to go to war or to bargain. In short, decisions to go to war depend on endogenous armament environment of countries (*endogenous power*, see Jackson and Morelli 2011). Peaceful outcomes are not necessarily the efficient ones in the presence of endogenous-arm settings. Arms are expensive investments, and a long period of peace with costly armament levels can be worse than having an early conflict and then thereafter living in a unified country with peace without arms (cf. Coccia 2017c). A peace agreement becomes attainable after the balance of power has shifted, such that there is a political interest

in both sides to agree to peace. However, this process can take a long run.

### Theory of the Global Leadership of Superpower

Superpowers are nations with a high economic war potential that influence other geoeconomic regions (Coccia 2019a). Superpowers have the goal of global leadership, and they can develop conflicts to cope with environmental threats or to take advantage of important strategic opportunities. Put differently, superpowers, winning conflicts, can achieve and/or sustain a global leadership in a world economy to take advantage of important socioeconomic and political opportunities (Coccia 2015, p. 203). Linstone (2007a, p. 115) states that: "the winner in each case became the leading global power, a new global political economy emerged, and democracy advanced" (cf., Devezas 2006; Linstone 2007b). In fact, the world is increasingly global, complex, turbulent, rich, interconnected, and multilevel; the only feasible strategy of superpowers is to develop conflicts for achieving/sustaining a global leadership in world economy that is subsequently supported with an economic and technological superiority in comparison with other belligerent nations (cf., Modelski 2010, p. 1419ff; Coccia 2005, 2015, 2018a, b, 2019e). The conflict development of superpowers appears to be a necessary phase for human development, which is not monotonous and linear but rather a disequilibrium process within world system (cf., Gini 1921). The conflict development of superpowers can be also due to prove military and scientific superiority toward other belligerent nations to maintain the *status quo* of current leadership and social power in the international system. Moreover, the conflict development of superpower generates demand- and supply-side shocks for domestic economy and for economies of allied countries. In fact, conflicts can generate vital technological, economic, and infrastructural preconditions for an "age of high mass consumption" (Rostow 1959, pp. 11–13). The main effects of military conflicts are output, productivity, and technological growth of superpowers and interrelated countries (cf., Ruttan 2006). For instance, Wright (1997, p. 1565) examines the "American technological leadership" and shows that many sectors and industries of US economy take advantage from fruitful demand- and supply-side effects of conflicts. Superpowers, developing conflicts, support R&D investments to produce military technologies that are transferred to civilian applications in the long term, generating new patterns of economic growth (Coccia 2015, 2017a, 2018a, 2019a). In short, the mobilization of human and economic resources of superpowers for conflict development increases the rates of inventions and technological innovations that in the postwar period are diffused to support long-run productivity and economic growth of nations (Stein and Russett 1980, p. 412; Coccia 2005, 2015, 2017a, d, 2018a). In this theory, conflict development of some countries can be also due to change the hierarchy of power between nations in international system and generate a new distribution of political power at international level (cf. Levy 1983, 2011). Modelski (1972, p. 48) asserts that the "war causes the Great Powers," such as Roman Empire over 200 BCE (Before Common Era) ~ 400 AD, Britain Empire in the 1710–1850 period, the United States from the 1940s onward, etc. (Stein and Russett 1980). Overall, then, this theory by Coccia (2015) argues that nations, with a high economic war potential (i.e., superpowers), develop conflicts to achieve/sustain the goal of global leadership and to increase the social power in international system to take advantage of important economic opportunities over time and space. However, superpowers may also assume a worldwide role close to autocracy in order to sustain their global leadership with a behavior prone to a permanent "wartime" and political strains in different geoeconomic regions (cf., Linstone 2007a, p. 237).

## Conclusion

A comprehensive analysis of the causes of war, affected by manifold factors, is a nontrivial exercise. Wars are specific events in society associated with human activity and human nature in order to take advantage of important opportunities, to cope

with and/or adapt to environmental threats and/or changing contexts (cf. Coccia 2019d, e, f). Overall, then, wars are due to instability of economic, social, demographic, ethnic, anthropological, religious, and perhaps biological factors in human society (cf., Coccia 2019a, b, c). To conclude, sources of wars are mainly linked to the question of what human beings truly need and how they seek to satisfy needs, to solve social issues, and to adapt to environmental threats and changing socioeconomic and political contexts in society.

# Comparative Theories of the Evolution of Technology

Mario Coccia
CNR – National Research Council of Italy, Torino, Italy
Yale University, New Haven, CT, USA

C

## Synonyms

Nature of technology; Technological advances; Technological change; Technological evolution; Technological progress

## Definition

Evolution of technology is a stepwise advancement of a complex system of artifact, driven by interactions with sub-systems and other technological systems, considering technical choices, technical requirements, and science advances, which generate new and/or improved products or processes for use or consumption to satisfy increasing needs of people and/or to solve complex problems in society.

## Introduction

The evolution of technology plays an important role for the economic and social change of societies and the competitive advantage of firms and nations (Arthur 2009; Basalla 1988; Bryan et al. 2007; Coccia 2018a, b, 2019a, b, c; Hosler 1994). In order to explain main theories of the evolution of technology, it is important to clarify the concept of evolution and of technology.

Firstly, evolution is a stepwise and comprehensive development of a complex system in nature and/or in society (cf. Coccia 2019e).

Secondly, technology is a complex system of artifact that is composed of more than one entity or sub-system and a relationship that holds between each entity and at least one other entity in the system (Coccia 2018a, 2019a). Technology is

selected and adapted in society to satisfy needs, achieve goals, and/or solve problems of people, institutions, and nations (Coccia 2005b, 2006, 2012, 2015b, 2017b, 2019a; Coccia and Wang, 2015). Another important concept is the interaction between technologies: an interrelationship of information/resources/energy and of other physical/chemical phenomena in interrelated complex systems of artifacts for reciprocal adaptations in markets and society (Coccia 2019a). In this context, the coevolution of technologies is the evolution of reciprocal adaptations in a complex system, supporting the reciprocal enhancement of technologies' growth rate and innovations (Coccia 2019a).

Moreover, any technology is *not* independent from the behavior of other technologies (Coccia 2018a, b). Sahal (1981), analyzing the patterns of technological innovation, argues that "evolution. . .pertains to the very structure and function of the object (p. 64) . . .. involves a process of equilibrium governed by the internal dynamics of the object system (p. 69)." (cf. Coccia 2005b, 2006, 2012, 2014b, 2016) Kauffman and Macready (1995, p. 26, original emphasis) state that "Technological evolution, like biological evolution, can be considered a search across a space of possibilities on complex, multipeaked 'fitness,' 'efficiency,' or 'cost' landscapes." Kauffman and Macready (1995, p. 27 and p. 42) also point out that evolution, biological or technological, is actually a story of coevolution. In particular, the evolution of technology paves the way for other technologies in a process that Kauffman has called "expanding the adjacent possible." Tria et al. (2014) suggest a model, based on a generalization of Polya's urn, that predicts statistical laws for the rate at which novelties happen (e.g., Heaps' law describes the number of distinct words in a document as a function of the document length, so-called type-token relation), as well as signatures of the process by which one novelty sets the stage for another (i.e., technological evolution). In this research field, Iacopini et al. (2018) describe the occurrence of novelties as a (noncausal) network exploration process (an edge-reinforcing random walk) showing the appearance of Heaps's law, whereas the model by Mazzolini et al. (2018, p. 8) shows that the causal relationships between individual components encoded in the network affect the trend of Heaps's law and thus the probability of finding new components in a dependency cone added to a realization (cf. Vespignani 2009).

In general, technological evolution can be explained in economics and management with two different approaches (Fig. 1):

- Traditional theories are based on processes of competitive substitution of a new technology for the old one and a competition between predator and prey technologies in markets.

**Comparative Theories of the Evolution of Technology, Fig. 1** Theories of the evolution of technology

- New theories based on a multimode interaction between technologies (Coccia 2018a, 2019a; Pistorius and Utterback 1997; Sandén and Hillman 2011; Utterback et al. 2019). A main theoretical framework in this new research stream is the theory of technological parasitism by Coccia (2019a).

## Theories of the Evolution of Technologies Based on Competition Between New and Established Technologies

### The Viewpoint of Technological Substitution and Competition Between Technologies

The adoption and diffusion of a new technology is associated with the nature of some comparable older technology in use. When comparable technologies do exist, each technology tends to affect the behavior of the other. In fact, the evolution of technology does not take place in isolation, but it is a process of actual substitution of new technology for the old one. In this context, an established technology can improve when confronted with the prospect of being substituted by a new technology. Pistorius and Utterback (1997) argue that emerging technologies often substitute for more mature technologies. In general, the interaction between technologies is typically referred to as competition between new and old technology. As a matter of fact, Pistorius and Utterback (1997, p. 72) claim: "Pure competition, where an emerging technology has a negative influence on the growth of a mature technology, and the mature technology has a negative influence on the growth of the emerging technology." Overall, then, a competition is often embodied in substitutes, and Porter (1980) considers substitutes as one of the forces in his model of industrial competition for competitive advantage of firms and nations (cf. Calabrese et al., 2005; Coccia 2005a, 2015b, 2017b, 2018c, 2018d, 2019d; Coccia and Wang 2015).

### Model of Fisher and Pry

Fisher and Pry (1971, p. 75) argue that technological evolution consists of substituting a new technology for the old one, such as the substitution of coal for wood, hydrocarbons for coal, etc. Fisher and Pry (1971) modeled the evolution of a new product or process becoming a substitute for a prior one and they plotted the substitution data in the form of $f/(1-f)$ as a function of time on semilog paper, fitting a straight line through the resulting points – where $f$ is the market share of the emerging product or process in question versus time (cf. Utterback et al. 2019, p. 2). Fisher and Pry (1971, p. 88) state that "The speed with which a substitution takes place is not a simple measure of the pace of technical advance . . .. It is, rather a measure of the unbalance in these factors between the competitive elements of the substitution."

### Predator-Prey Approach

Farrell (1993a, b) used a model based on Lotka-Volterra equations to examine pure competition between various technologies, such as nylon versus rayon tire cords, telephone versus telegraph usage, etc. In this context, the interaction between technologies can generate a predator-prey relation, where one technology enhances the growth rate of the other, but the second inhibits the growth rate of the first (Pistorius and Utterback 1997, p. 74). In fact, a predator-prey relationship can exist between an emerging technology and a mature technology, where emerging technology enters a niche market. In this case, emerging technology can benefit from the presence of mature technology. At the same time, emerging technology may reduce the market share of mature technology. Overall, then, a predator-prey interaction has an emerging technology in the role of predator and the mature technology as prey. However, it is also possible to visualize a situation where a mature technology is predator and emerging technology is prey (Pistorius and Utterback 1997, p. 78). Utterback et al. (2019) show this type of predator-prey relation in a specific period between plywood and oriented strand board (OSB) technology (OSB is a composite of oriented and layered strands, peeled from widely available smaller trees).

## New Theories of the Evolution of Technologies based on Multimode Interactions

### The Viewpoint by Utterback and Other Scholars

Utterback et al. (2019) suggest to abandon the idea that technology and innovation originate only in pure competition between new and established artifacts. These scholars argue that the growth of one technology will often stimulate the growth of other technologies, calling this interaction as *symbiotic competition* (Utterback et al. 2019).

As a matter of fact, there are many cases where technologies interact in a relationship that is not of competition in the strict sense of the word. In this context, Pistorius and Utterback (1997, p. 72ff) suggest different interactions among technologies in analogy with biology. Sandén and Hillman (2011, p. 407) also propose six technological interactions, using a similarity with the interaction of species, i.e., neutralism, commensalism, amensalism, symbiosis, competition, and parasitism-predation into one category. Coccia (2018a) suggests a matrix to show how these different relationships between technologies evolve over time (Fig. 2). Pistorius and Utterback (1997, p. 67) argue that a multimode interaction between technologies provides a much richer theoretical framework for technology analysis.

**Comparative Theories of the Evolution of Technology, Fig. 2** Types of relationships between technologies and evolutionary pathways in a complex system. (*Note:* The notions of positive, negative, and neutral benefit to technologies T*i* and T*j* in a complex system S from mutual interaction are represented with the following symbols of logic: +, –, 0 (zero); ++ is a strong positive benefit to technologies T*i* and T*j* in S from long-run mutual symbiotic interaction, i.e., coevolution of T*i* and T*j* in S, $\forall i = 1, \ldots, n; \forall j = 1, \ldots, m$. Thick solid arrows indicate the probable evolutionary route of interactive technologies in a complex system *S*: the possibility for parasitic-virus technologies to become commensals, mutualists, and symbiotic; thin arrows show other possible evolutionary pathways of technologies T*i* and T*j* during the interaction in a complex system *S* of artifact.)

### Theory of Technological Parasitism and Virus Technologies

Technological parasitism by Coccia (2018a, 2019a) is a *new* theory to explain the evolution of technology in society considering the interaction between technologies that generates the coevolution of a host-parasite complex system of artifacts. The theoretical background of this theory is based on a "Generalized Darwinism" (Hodgson and Knudsen 2006) for framing a broad analogy between technologies and evolutionary ecology of parasites that provides a logical structure of scientific inquiry (cf. Coccia 2018a, 2019a). Basalla (1988) suggested that the evolution of technology can profitably be seen as analogous to biological evolution. Technological evolution, alongside biological evolution, displays radiations, stasis, extinctions, and novelty (Solé et al. 2013).

The crux of the theory of technological parasitism is rooted in the evolutionary ecology of parasites, and since the concept of parasite is uncommon in economics of technology, it is useful to clarify it. In the evolutionary ecology, parasites (from Greek *para* = near; *sitos* = food) are any life form finding their ecological niche in another living system (host). Parasites have a range of traits that evolve to locate in available hosts, to survive and disperse among hosts, and to reproduce and persist. Coccia (2018a, 2019a) argues that technologies can have a behavior similar to parasites because technologies cannot survive and develop as independent systems per se, but they can function and evolve in societies if they are associated with other host or master technologies, such as audio headphones, wireless speakers, software apps, etc. that function *if and only if* they are associated with host or master electronic devices, such as smartphone, radio receiver, television, etc. In particular, a parasitic technology $P$ in a host or master technology $H$ is a technology that during its life cycle is able to interact and adapt into the complex system of $H$, generating coevolutionary processes to satisfy human needs and desires and/or solve problems in society. Parasitic technologies are often sub-systems embedded within and primarily functional in the ecological system of host *or* master technologies. A technology can be a parasite of different hosts *or* master technologies, as well as a technology can be a host or master of different parasitic technologies (e.g., mobile devices are host of software applications, headphones, Bluetooth technology, and other parasitic technologies, cf. Coccia 2018a). In general, many technologies do not function as independent systems, but *de facto* they depend, as parasites, on other technologies (hosts *or* masters) to form a complex system of parts that interact in a non-simple way. This behavior of technologies can be generalized with the *theorem of not independence of any technology* (Coccia 2018b): the long-run behavior and evolution of any technological innovation T$i$ is not independent from the behavior and evolution of the other technological innovations T$j$ ($\forall i = 1, \ldots, n$ and $j = 1, \ldots, m$).

In particular, parasitic technologies can be considered specifically as *virus technologies* because they have the characteristics of obliged parasites, as they depend on a host *or* master for most of their technological functions and developmental processes. Some virus technologies are able to function only to a specific host (e.g., diesel fuel as virus technology can be used only in compression-ignition engines as host technologies), while others are able to function on many host technologies (e.g., electrical energy as virus technology can be used for many appliances of different scale). Moreover, parasitic-virus technologies can be defined and classified on the basis of the technological host in which they adapt, and their evolution in the form of different generations is due to interaction with hosts. Moreover, a technology can be seen as a parasite or host, depending on the scale of analysis. Smartphone is host of many parasitic technologies, e.g. Bluetooth technology, but it can be also seen as a parasite of satellite technology for some functions, communication and transmission of information.

This theory of technological parasitism proposes a model to analyze the interaction between a host *or* master technology ($H$ system) and a parasitic-virus technology ($P$ sub-system).

The logarithmic form of the model (Coccia 2019a) is a simple linear relationship:

$$\log P = \log a + B \log H + u_t$$

- $P$ = evolutionary advances of parasitic-virus technology, e.g., fuel consumption efficiency in horsepower hours indicates the technological advances of engine for farm tractor
- $\log a$ = constant
- $H$ = evolutionary advances of host *or* master technology, e.g., total mechanical efficiency of farm tractor
- $u_t$ = error term

$B$ is the evolutionary coefficient of growth that measures the evolution of technology $P$ (parasite) in relation to $H$ (host *or* master technology). In particular, the value of $B$ measures the relative growth of $P$ in relation to the growth of $H$, and it suggests different patterns of technological evolution:

- $B<1$ (underdevelopment of host-parasite technological system)
- $B=1$ (isometric growth of host-parasite technological system)
- $B>1$ (development of host-parasite technological system)

This theory of technological parasitism and virus technologies suggests critical theoretical and empirical predictions in the evolution of technology (Coccia 2018a, 2019a):

1. The long-run behavior and evolution of any technology depend on behavior and evolution of interrelated technologies; in particular, the long-run behavior and evolution of any technology are driven by interactions with other technologies within and between complex systems of technology (Coccia 2019a, b, c).
2. The long-run evolution of an established technology is also due to interaction with *new* parasitic-virus technologies.
3. Technological host *or* master with many parasitic-virus technologies generates a rapid stepwise evolution of technological host-parasite system. Technological systems with fewer parasitic-virus technologies and a low level of interaction with other technologies improve slowly.
4. Interaction within and between technological host-parasite systems generates coevolution of interrelated systems. May (1981, p. 95) suggests the concept of "orgy of mutual benefaction" that may be also appropriate for explaining the interaction within technological domains.

In fact, in this context, the property of mutual benefaction by Coccia (2018a) argues that the interaction between technologies reduces negative effects and favors positive effects directed to an evolution of reciprocal adaptations of technologies in complex systems of technology over time and space (cf., vertically transmitted parasites by Cullen, 1998).

The idea of a *technological parasitism* associated with technological host-parasites coevolution is adequate in some cases but less in others because of the diversity of technologies in different complex systems and socioeconomic environments (cf. Coccia 2018a; Pistorius and Utterback 1997; Sandén and Hillman 2011). Nevertheless, the analogy here keeps its validity in explaining several phenomena of the coevolution of technology in markets and society. Overall, then, the theory of technological parasitism and virus technologies contributes to our understanding of how a technology works, how it is organized, and how it develops. This new theory suggests some general properties and predictions that are a reasonable starting point for understanding the universal features of the coevolution of technologies that leads to technological and economic change in society.

However, this theoretical framework, of course, cannot predict any given paths and characteristics of the evolution of technologies with precision. We know, *de facto*, that other things are often not equal in the domain of technology over time and space.

## Conclusion

The evolution of technology is associated with the idea of human progress. The prime factor of the evolution of technology is a progressive satisfaction of human wants, such as the improvement of health, the growth of wealth, the creation of new knowledge, the solution of complex problems, etc. In general, determinants of technological evolution seem to be human wants and human control of nature through science advances and newtechnology (cf. Coccia 2010, 2018a). Moreover, the evolution of technologies is faster in appropriate social structures with strong democracy, good economic governance, widespread higher education system, skilled human capital, moderate growth rates of population, purposeful socioeconomic systems with high economic potential (e.g., superpower), etc. (Coccia 2010, 2014a, 2015a, 2018a, 2019b). These elements support the evolution of technology and advancement of science for the acquisition of better and more complex forms of life in society.

To conclude, evolution of technology is a result of human activity and of human nature in order to take advantage of important opportunities, to cope with and/or adapt to environmental threats and/or changing contexts. Overall, then, evolution of technology is mainly linked to the question of what human beings truly need and how they seek to satisfy needs, to solve socioeconomic issues, and to adapt to new social, political, and economic conditions. However, a comprehensive explanation of the evolution of technology is a difficult topic for manifold complex and interrelated factors, such that Wright (1997, p. 1562) properly claims that "In the world of technological change, bounded rationality is the rule."

# Comparative Urban Development

Anurag Kumar Srivastava
Department of Public Administration, School of Liberal Studies, Pandit Deendayal Petroleum University, Gandhinagar, Gujarat, India

## Synonyms

Comparative city planning; Comparative urbanization practices; Correlated metropolitan growth; Corresponding municipal development; Relative civic progression; Relative urbanization scenario

## Introduction

Urban development covers a set of policies, plans, strategies, and approaches to create infrastructure and deliver services for education, health, transportation, pollution control, waste management, markets, industries, enterprises, investment zones street pavements, housing, cultural heritage, and recreation in urban areas in a manner which ensures sustainability through optimum utilization of men, material and environmental resources.

Urbanization is the defining paradigm of twenty-first century. Urbanization seems to be unstoppable and inevitable; henceforth, it is necessary to make sure that urban infrastructure and urban services in regard to housing, transportation, health, education, and employment, etc., should be commensurate with increasing urbanization and growing complexities of urban development. Urbanization being a global phenomenon impacts countries irrespective of developed and developing; nonetheless it is highly imperative to identify the best practices, ways, strategies, approaches, and governance models which have been adopted in various countries.

However, as the contextual parameters of socio-economic, political, and environmental milieu differ in developing and developed countries, henceforth, adopting the comparative urban development perspectives will require integration of global practices in to local systems and policies for facilitating urban development. Urban development requires a sustainable development approach wherein our cities become truly smart and sustainable. They not only provide better life opportunities to the people in terms of job, enterprise, and education but also clean, green, and healthy environment.

For the first time in history, the majority of people live now in urban areas. The proportion of the world's population which is staying in urban areas has been growing rapidly and a higher fraction of the total population lives within cities now that at any previous period in history. (United Nations 2008, Principles and Recommendations for Population and Housing Census). Since last two–three decades, the pace of urbanization has witnessed phenomenal increase in developing countries like India and China. The underlying force behind rapid urbanization is growing industrialization coupled with high rate of economic growth. India, for instance, has added more number of people to its urban population than rural population as per the census figures of 2011.

Today, 54% of the world's population lives in urban areas, which is expected to increase to 66% by 2050. Urbanization combined with the overall growth of the world's population could add another 2.5 billion people to urban populations by 2050, with approximately 90% of the increase to take place in Asian and African continent. (World Urbanization Prospects: The 2014 Revision).

The largest urban growth will take place in India, China, and Nigeria. These three countries will account for 37% of the projected growth of the world's urban population between 2014 and 2050. By 2050, India is projected to add 404 million urban dwellers, China 292 million, and Nigeria 212 million. The urban population of the world has grown rapidly from 746 million in 1950 to 3.9 billion in 2014. Asia, despite its lower level of urbanization, is home to 53% of the world's urban population, followed by Europe with 14% and Latin America and the Caribbean with 13% (World Urbanization Prospects: The 2014 Revision).

## Signifying Comparison

As per Woodrow Wilson "You cannot be scientific if you are not comparative".

Robert Dahl elaborated that if Public Administration has to be comparative, it needs to address the few concerns one of which is being comparative for being scientific (Dahl 1947). Comparative study will further enhance the scope and applicability of the study for understanding the broader processes of urban development. The above statement of Dahl highlights the significance of comparison. Comparison is essential for achieving universality and for adopting the best practices and overcoming the shortcomings. It is by comparison the strength and weakness are analyzed in rationale perspectives. Inferences drawn from comparative understanding of urban development would be of immense significance to the larger perspective of urban development.

Emile Durkheim axiom that science begins with comparison highlights the significance of scientifically analyzing a large number of cities across different national boundaries. There are other significant explanations why comparison enables to clarify and better elucidate phenomenon such as comparison more specifically shows how variables work differently in a variety of settings, comparison provides better way to understand how the identification of anomalies within different social systems can be refined and eventually increase theoretical understanding.

## Defining the Urban

However, there is no universal definition exists for urban. Therefore, defining what is urban has been a problematic task and there is no commonly accepted definition. Each country has described the term urban in its own way and which refers to cities, towns, villages, conurbations, or localities. There are a number of approaches which have been identified to determine what an urban area is. An economic approach would be based on administrative units and would define urban areas using a threshold for labor force (economically active population rates) in agriculture (United Nations 1974). A geographic approach is based upon the density. This kind of analysis takes population or houses in a territory in to the consideration.

In the absence of an agreed-upon definition, the Organisation for Economic Co-operation and Development (OECD) uses three types of units of analysis when assessing the socio-economic performances of urban areas.

(i) Urban areas. These refer to urban areas as they are defined by the national authorities of each country. However, often these urban areas are too small or too large to account for a city.
(ii) Predominantly urban areas (PU). They are regions where the population living in high-density areas (150 inhabitants per square kilometer) represents at least half of the population in that region.
(iii) Metropolitan areas (functional areas). These are the areas in which population density, net commuting rates, and type of region are kept in to account. These are typically large cities comprised by a number of administrative and adjacent areas where economic relations are intense.

It is quite evident that the definition of "urban" differs from country to country and, with change in the parameters of classification and evolving circumstances, can also differ within the same country, thereby making direct comparisons challenging. In a nutshell, an urban area can be defined by following criteria:

(a) Administrative criteria or political boundaries: An area within the jurisdiction of a municipal corporation, municipality, or town committee.
(b) Population: An area where the minimum population in a region is of 2000 people, although this differs globally between 200 and 50,000 along with higher population density per square kilometer.
(c) Economic function: An area where a substantial majority of the population is primarily engaged in nonagricultural pursuits.

(d) Existence of urban characteristics: An area where urban features like concrete streets, electric lighting, sewerage system are present.

## Sources of Urban Growth

The growth of cities is the consequence of the relationship of a number of factors:

(a) Natural growth – The predominance of births over deaths among urban populations.
(b) Migration – In simple words is the movement of people from rural areas of the country to the urban areas in search of better life opportunities.
(c) Conversion and reclassification of previously rural areas in to urban areas.

Recognizing the relative contributions of each of these factors to urban growth can facilitate proper planning and comprehensive policy formulation for shaping the urban development.

## Comparative Perspectives

One of the most significant characteristics of urbanization that has the direct impact on people's lives is that of movement of the population, due to push or pull factors. Contrary to common belief, migration does not take place from developing to developed countries or between countries, but within national borders. (Human Development Report 2009).

In India internal migration rates are estimated to be 4.1% which suggests that more than 40 million people move internally. In Bangladesh the rural to urban migrations has contributed more than 40% of the change in its urban population. In China more than 136 million people have moved. In Korea 63% of the population live in rural areas in 1963, but only 7% remained there by 2008. In Malaysia where 80% of the population was rural in 1950 but only 35% in 2005, Indonesia's urban population nearly doubled since 1990 to 2005 (Beall et al. 2012).

Globalization and state devolution have also affected modes of urban governance. In Western Europe and the United States, cities have increasingly adopted corporatist modes of governance (Harding 1997). As far the Britain is concerned the shift from managerialism to corporatism has resulted from state restructuring, in which business sector participation in the governing process has become a usual feature. In the United States, the corporatist modes of urban governance have gained the momentum along with withdrawal of federal government. Increased dependence on corporate support for improving the cities is the dominant trend (Eisinger 1998; Clarke and Gaile 1998).

Corporatist engagements in German cities have become visible due to economic restructuring and inability of bureaucracy to respond to rapid transformation in the urban development prospects.

In France, the process of devolution has considerably transformed the relationship among national, regional, and local government officials. The officials are more inclined towards forging the collaboration with corporate and business entities for formulating and implementing urban development policies and programs particularly in regard to urban economic development (Michel 1998; Négrier 1999).

In India since 1992 the process of democratic decentralization has been initiated through which power and authority has been vested in elected urban local bodies. The urban local bodies have been accorded with constitutional status for effectively carrying out urban development.

## Conclusion

The combined effect of globalization, migration, and urbanization usually accompanies social and economic development. Globalization and capitalist-driven market-based forces have created a spatial pattern of patchy and irregular urban economic development based on cities' capability to invite industrial investment.

The cities that have been able to attract such investment have been transformed in to big metro cities or mega cities having the state-of-the-art urban infrastructure, transportation, housing, industrial complexes, and amenities.

Several cities are now on the path innovation and transformation to develop into smart cities in order to cope up with rising challenges of urbanization. Smart cities or futuristic cities are an emerging paradigm of urban development; the concept and model of smart cities has been adopted from European and Western countries in the developing countries to address the challenges of urban development. Smart cities have generated significant policy euphoria in especially in India; however, the feasibility of smart cities in developing requires cautious approach with empirical validation and due analysis.

Governments across the globe have adopted new strategies for administering urban development, such as devolution, democratic decentralization, public private partnership, and corporatist modes of governance. Cities have been competing for attracting both foreign and domestic investment with each other; henceforth, urban infrastructure, services, planning, polices, and governance become decisive and crucial.

Currently majority of the cities particularly in Asia subcontinent are heavily populated, highly polluted, and lack quality urban infrastructure and are characterized by financial and governance deficits. The internal migration has further accentuated the crisis pertaining to uncontrolled and unplanned urban development. In the context of developing countries, the absence of quality urban infrastructure, poor delivery of urban services, and governance deficit have resulted in concentration of slums, alarming level of pollutions, poor sanitation, hygiene, and health.

Rapid urban growth in current form and scale challenges the capacity of local, state, and national governments to deliver even the most basic urban services such as water, electricity, sanitation, housing, and health to the people.

It is in this context the significance of comparative urban development becomes imperative, in order to promote smart and self-sustainable urbanization by adopting good governance practices in a comparative framework. There are constraints on our understanding of knowledge about comparative urban development and sustainable development policies.

The urbanization, towards which the world appears to marching ahead, offers opportunities as well challenges. Urban realities, urban progression, and urban policies are considerably complex, multidimensional, and multifaceted which require interdisciplinary, interinstitutional, and cross national analysis to accomplish urban development.

# Comparative World-Systems Theories

Mario Coccia
CNR – National Research Council of Italy, Torino, Italy
Yale University, New Haven, CT, USA

## Synonyms

Capitalistic world economy; Core-periphery areas; World economy; World market; World-systems analysis

## Definition

*World-systems theory* is a socioeconomic and political approach that explains the economic development and dynamics of capitalistic world economy analyzing the mechanisms of international market trade, economic division of labor between core and periphery regions, and interests of capitalist class in markets.

## Introduction

Wallerstein (1974) suggests a world-systems theory that explains the economic development of nations analyzing economic and political mechanisms between core and peripheral regions to create an alternative approach to theories of modernization (Seymour Lipset 1955; cf., Skocpol 1977). This theoretical framework by Wallerstein (1974) rejects the nation-state as the sole unit of analysis, the assumption that all countries can follow only a single path of development and that poor countries can rely on exports to develop. The theoretical background of the world-systems theory by Wallerstein (1972, 1974) is the Annales school, Marx studies, and dependence theory. Wallerstein's theory accepts some concepts of the Annales school, such as geoeconomic regions as units of analysis, empirical and historical materials to explain development, etc. (Braudel 1994). Wallerstein (1972, 1974) also considers the centrality of the capital accumulation (a commercial asset value that is used by capitalists to obtain additional value, i.e., surplus value) and competitive class struggles by Karl Marx's theories. World-systems theory is also based on dependency theory that focuses on core-periphery geoeconomic relations (Chirot and Hall 1982). In particular, international-dependence models consider developing countries in a relationship of dependence with rich countries and the power imbalance between rich and poor countries (cf., Lewellen 1995). Moreover, Wallerstein's approach is affected by Schumpeter (1942) with his theory of business cycle and the role of innovation as driving force of liberal capitalist development (cf., Chase-Dunn and Grimes 1995; Coccia 2007, 2010c, 2017, 2018b). Figure 1 shows some differences between modernization and world-systems theory.

## World-Systems Theory

Wallerstein (1974, p. 374) states that:

> a world-system is a social system, one that has boundaries, structures, member groups, rules of legitimation, and coherence. Its life is made up of the conflicting forces which hold it together by tension and tear it apart as each group seeks eternally to remold it to its advantage. It has the characteristics of an organism, in that is has a lifespan over which its characteristics change in some respects and remain stable in others. . .Life within it is largely self-contained, and the dynamics of its development are largely internal.

In the world-systems theory by Wallerstein (1974) a vital concept is "world economy" integrated through markets, rather than a political center, in which two or more regions have geoeconomic interaction with respect to necessities like food, natural resources, and protection (Goldfrank 2000).

Wallerstein (1974, p. 347) endeavors to explain the capitalist world economy as a: "social system. . . .largely self-contained entity whose developmental dynamics are largely internal." Wallerstein (1974) also argues that world markets are based on economic division of labor, in particular a world-system is: "multicultural territorial division of labor in which the production and exchange of basic goods and raw materials is necessary for the everyday life of its inhabitants (Chase-Dunn and Grimes 1995, p. 389)." This division of labor refers to the forces and relations of production of the world economy, and it leads to the existence of two interdependent regions: core region focuses on capital-intensive production, whereas periphery region is based on labor-intensive production (Goldfrank 2000). Semi-peripheral states act as a buffer zone between core and periphery regions (Skocpol 1977). The dynamics of world system generates an *unequal exchange*, which is due to the systematic transfer of surplus from periphery to core societies (Goldfrank 2000). This process also leads to a *capital accumulation* in core regions based on appropriation and transformation of resources

**SOCIAL CHANGE**

**CLASSICAL THEORIES OF MODERNIZATION AND DEVELOPMENT**

- Seymour M. Lipset 1955
  - *Nation-state as the sole unit of analysis*
  - *All countries go through the same stages of development*
  - *Poor countries can rely on exports to develop*
  - *Traditional culture and institutions block modernization process*

**WORLD SYSTEMS THEORY**

- Wallerstein 1974
  - *core-periphery geoeconomic interaction in a world trade market of commodities*
  - *economic division of labor in world market*
  - *multiple political sovereignties, no one of which can control the entire economic system*
  - *a power hierarchy between core and peripheral societies, in which powerful and wealthy "core" societies dominate and exploit weak and poor peripheral countries*

⇓

A world capitalistic system–in which some powerful countries benefit while others are exploited–generates both economic development and spatial inequality because some economic subjects tend to appropriate and reinvest resources, producing surplus, in richer areas.

**Comparative World-Systems Theories, Fig. 1** Modernization theory vs. world-systems theory of development

from peripheral areas. This dynamics of the world system generates a power hierarchy between *core* and *periphery*, in which powerful and wealthy "core" nations dominate and exploit weak and poor "peripheral" nations (Fig. 2).

According to Wallerstein (1974), the history has had two types of large-scale social systems: (1) empires with a functional economic division of labor and an approach of tribute-collecting imperial state and (2) world economies with multiple political sovereignties, no one of which can control the entire economic system. A world economy should be more able than a world empire to sustain economic development because economic subjects have more freedom to maneuver, to appropriate, to reinvest economic resources and to obtain surplus. This world economy, such as capitalism from the sixteenth century to the present, has an international division of labor among three regions (core, semiperiphery, and periphery) linked together by a world trade market in bulk commodities (necessities for consumption of population). Each geoeconomic region of the world economy has an economic structure based on a mixture of economic activities (e.g., products from multi-cultivation in agriculture within core areas; products from mono-cultivation in periphery areas) and labor control (e.g., skilled wage labor in core regions; sharecropping in semiperiphery regions; and slavery or "coerced cash-crop labor" in the periphery areas). Economic rewards of these zones are differential; in particular, core areas obtain and sustain a disproportionate surplus in comparison with periphery areas (Fig. 2). Moreover, the economic structure of each region supports a dominant class oriented toward the world market, and powerful nations operate in

**Comparative World-Systems Theories, Fig. 2** Aspects of the interaction between core and periphery within world-systems theory

the interests of that dominant class. According to Wallerstein (1974), the differential strength of multiple states within world capitalist economy is crucial for maintaining the stability of overall economic system. In this context, the strong nations reinforce and increase the differential flow of surplus from periphery to core zone because they provide "extra-economic" assistance to capitalist classes that manipulate and enforce trade in their favor on world market (Skocpol 1977, pp. 1076–1077).

This Wallerstein's model of the world capitalist system also considers a two-step reduction (Skocpol 1977, pp. 1078–1079): "first, a reduction of socioeconomic structure to determination by world market opportunities and technological production possibilities; and second, a reduction of state structures and policies to determination by dominant class interests".

The first reduction is based on the mode of labor control adopted in each region by dominant classes oriented to world market. Wallerstein (1974) argues that dominant classes choose freely among alternative strategies of labor control by assessing rationally the best means for maximizing profits, given the geographical, demographic, technological, and labor-skill conditions in which they operate and given the profitable possibilities they face for selling particular products on world market. Wallerstein (1974) treats "labor control" primarily as a market-optimizing strategy of dominant classes. Moreover, marketplace has differences of occupational structure among regions: "a capitalist world-economy essentially rewards accumulated capital, including human capital, at a higher rate than 'raw' labor power" (Wallenstein 1974, p. 350). Wallerstein (1974, p. 401, original emphasis) also argues that: "Once we get a difference in the strength of the state-machineries, we get the operation of 'unequal exchange' which is enforced by strong states on weak ones, by core states on peripheral areas. Thus capitalism involves not only appropriation of surplus-value by an owner from a laborer, but an appropriation of surplus of the whole world-economy by core areas."

The second reduction of the Wallerstein's model is that differences of strength and policies among states located in different zones of the world system are explained as the result of differences in regional rates of surplus appropriation

and, especially, as the expression of different world market interests of dominant classes within national political areas (Wallenstein 1974, chap. 3, *passim*). On the one hand, in the world system, the dominant capitalist classes want state protection for industries and their control of international trade; on the other hand, the periphery has weak states, and their dominant capitalist classes are interested in profiting from direct dealings with merchants of core regions. The functioning of the world system is that if states were equally strong (or potentially equally strong across the major regions): "they would be in the position of blocking the effective operation of transnational economic entities whose locus were in another state. It would then follow that the world division of labor would be impeded, the world-economy decline, and eventually the world- system fall apart" (Wallenstein 1974, p. 355).

In brief, mechanisms of world system are directly or indirectly an expression of *capitalist-class interests* that reshape institutions and their relations to take advantage of world market opportunities. Moreover, although dominant capitalist classes maximize their world market trading advantages, only the core-area capitalists want, need, and get the extra-economic assistance of strong states, while peripheral capitalists do not.

Wallerstein's theory can explain patterns of economic development in early modern Europe, whereas it does not clarify the patterns of development of absolute monarchies. In fact, once capitalist relations of production and accumulation were firmly established in England, the European states ensured that capitalist relations would spread both across Europe and over the entire globe through state initiatives by competing powers and through military conquests, as well as through market expansion. To put differently, according to this theory: "In the core states there evolved relatively strong State systems, with an absolute monarch and a patrimonial State bureaucracy working primarily for this monarch. The venality of office and the development of standing armies based on mercenaries were the critical elements in the establishment of such a bureaucracy" (Wallenstein 1972, p. 96). In general, the historical evidence does not fit overall patterns implied by Wallenstein (1974) with his theory. Moreover, economic division of labor within Wallerstein's theory (1974, pp. 354–355) cannot be held together as a "system," and the differential flow of surplus within core regions is likely to be disrupted in later stages of world capitalist development.

## Conclusion

Brenner (1976) shows that markets cannot primarily explain social-structural transformations or economic developments because, depending on preexisting institutional patterns of class relations, different classes may be in the best position to take advantage of available trade opportunities and thereby they have their particular positions strengthened (cf., Coccia 2013, 2016b, 2017c). Although Wallerstein (1974) asserts that world system is dynamic, he does not provide a theoretical explanation of why developmental processes occur.

The only definite dynamics of the Wallerstein's world capitalist system is market process: commercial growth, worldwide recessions, and the spread of trade in necessities to new regions of the globe (cf., Coccia 2010c, 2017b, 2018b; Coccia and Bellitto 2018). According to Skocpol (1977), the global expansion depends on the emergence and diffusion of major technological innovations (cf., Coccia 2008, 2013, 2014a, 2015a, 2016a, 2011, 2014, 2015, 2015b, 2016c, 2018, 2018b, 2019), but this process is unexplained by Wallenstein's theory (1972, 1974).

Moreover, the differential appearance of absolutist states in early modern Europe and their effects upon economic development are not adequately explained by Wallerstein's theory. Patterns of state development are better explained by Anderson (1974) and by Tilly (1975). These scholars suggest that, although no monocausal explanation of state building is possible, two sets of variables can clarify these relations. Firstly, internal class structures were important because they created different

possibilities for monarchs to extract resources and encouraged them to use available resources in different ways. Secondly, transnational structures were important, including the networks of trade and economic interdependence to which Wallerstein points. However, in the context of world development, other factors supporting the growth of core and periphery regions are culture and higher education system, low corruption, low criminality, high democracy, good economic governance, high innovative outputs, etc. (cf., Coccia 2010a, b, 2014). To conclude, Wallerstein (1972, 1974) has given some answers to the historical development of capitalism. Overall, then, the proposed theory by Wallerstein (1974) has raised important socio-economic issues for future challenges in social and political sciences of creating a comprehensive theory of development of world economy.

# Competence in Bureaucracy

Christopher L. Atkinson
Walden University, Minneapolis, MN, USA
School of Public Administration, Florida Atlantic University, Boca Raton, FL, USA
School of Public Administration, Florida Atlantic University, Fort Lauderdale, FL, USA

## Synonyms

Neutral competence; Responsive competence

## Definition

Bureaucratic competence: may be defined as the capacity of a public official or agency to efficiently and effectively accomplish the administrative role.

## Introduction

A hallmark of bureaucratic competence is awareness among public sector officials of the existence of and interaction between the spheres of politics and administration. Competence in bureaucracy is thought to be predicated not only on a thorough understanding of administrative practices and proficiency in policy-related subject matter, leading to effective and efficient government processes, but also a responsiveness to the direction of political forces. A considerable amount of power to direct, implement, and even design policy is resident in the bureaucracy. The neutrality and expertise of unelected public servants have historically

been a point of defense for the existence of a strong administrative sector with policy-making power (Rourke 1992), as well as a hallmark of the Weberian rational-legal bureaucratic tradition (Kearney 1988).

Historically, the province of administration has been focused on a concept of neutral competency; bringing to mind principal-agent theory, administration implements policy aspirations as directed by the political sphere. Attention has increasingly shifted to the view of a politically aware responsive competence, further leaving behind the ideal of a separation between politics and administration as originally envisaged by Wilson (1887). Administration is often responsible for value judgments as is the political sphere; administrative work is not limited to matters of implementation and results. Although the politics-administration dichotomy has been condemned as being unreflective of the practice of public administration, calls for bureaucratic competence remain. Such concerns speak to fundamental issues of legitimacy in the public sector and practical, normative, and democratic arguments for distinctness between administration and politics (Demir 2005).

In this entry, consideration is given to neutral competence, responsive competence, and reflections for bureaucratic competence as a matter heavily reliant on cultural and organizational context.

## Neutral Competence

Herbert Kaufman defined neutral competence as "the ability to do the work of government expertly, and to do it according to explicit, objective standards rather than to personal or party or other obligations and loyalties" (1956, p. 1060). Neutral competence, in evaluating various advocacy viewpoints and compromises among policy alternatives, can assist political forces in a variety of ways, including avoiding hazards through careful deliberation of policy alternatives, and add a level of credibility to policy proceedings through the inclusion of nonpartisan analysis (Weimer 2005). Ideally, neutral competence serves political forces with less regard for more partisan objectives and greater attention to quality of implementation. Administration thus serves as a "wealth of knowledge and skills available in the corridors of bureaucracy that all elected officials, no matter what their political persuasion, could call upon for both useful information and disinterested advice in designing national policy" (Rourke 1992, p. 539). While a strict separation of politics and administration is likely a myth, it is nevertheless still an ideal of public administration that administrators accomplish the goals of political leaders and do so in a nonpartisan manner (Kearney 1988).

Administrators are capable of complex technical work associated with the machinery of government; benefit-for-cost analyses and decision-making based on documentary requirements require knowledge and skill and are technical enterprises (West 2005). While it may be instinctive for an elected official to stock administrative positions with staff of like mind, such individuals may lack necessary skills to make government function properly, despite their considerable political acumen. While political appointees have ample boldness to direct change, they may not have "the recognition that they will have to live with the consequences of misplaced boldness" (Heclo 1975, p. 82). While acting as a ready resource for policy information to the political sphere, neutrally competent administrators also have the advantage of creating stores of knowledge throughout an organization on an informal basis (Heclo 1975).

However, in situations where public agencies are challenged by the desires of the political sphere, which may differ strongly on ideological counts even given a strong evidentiary base from the administrative perspective, neutral competence can turn from a valuable asset to a critical liability. Agencies striving for neutrality may be painted unfairly as unaccountable and obstructive, and in need of restraint, when in actuality the attention to deliberative process may benefit all concerned (Rourke 1992). Too much attention to neutral competence can leave administration seeming rule obsessed and too control oriented (Kearney 1988).

Neutral competence can be a difficult prospect for developing bureaucracies, due to "underdeveloped bureaucratic capacity, strong pressure for bureaucrats to be politically responsive, and bureaucratic inflexibility, perhaps resulting from civil service systems intended to isolate bureaucrats from electoral politics" (Weimer 2005, p. 139).

## Responsive Competence

The drive for neutral competence in public service is countered by increasing belief that administration must be accountable and responsible to political forces, above and beyond what is called for by neutral competence. Political responsiveness has been defined as "the link to the popular will as expressed in bureaucratic implementation of policy decisions of political leadership" (Kearney 1988, pp. 66–67). Responsive competency, as opposed to neutral competency, suggests that benefit can be best achieved through receptivity to political influences. "Organizational management has come to be considered an instrumental value dependent upon and subordinate to near-term political and policy objectives" (Moe 1985, p. 130). Executives have had to maneuver around neutral administrators precisely because such neutrality sometimes falls short in practice. Long-established values in how administration was to work with executive power gave way to the personal, persuasive power of elected leadership, as, for example, the role of the president was redefined over time (Moe 1985).

Administrators are less responsive, in this view, because of their tenure; they can be too caught up in maintenance of organizations to effect the sort of change that is characteristic of political shifts. Not only is it right for administrators to be responsive to the prevailing political will – a failure to be accountable to elected officials is a perversion of the purpose of bureaucracy in the first place and may actually assist in hiding far more serious concerns, such as public corruption in administration and a failure to appropriately serve citizen-clients (West 2005).

In an effort to be more responsive to elected officials and ultimately the public, administrators may find that they do not have all the answers to policy questions facing their agencies and that elected officials' calls for accountability, along with responsiveness to the feedback of the public, can contribute to better policy and agency function when taken constructively. Administrators should, for example, listen carefully and be responsible to public feedback to rulemaking (West 2005).

Responsive competence, like neutrality, is not all positive. Administrators that are less concerned with neutral competence might gain power through a close association with the objectives of partisan forces (Rourke 1992); if partisan views shift, administrators may find their power lessened, due to the perception that they are biased and unduly influenced by political forces. Unchecked responsiveness can raise significant ethical issues (West 2005). That political forces could get everything desired from administration, with no check on rightness of requests or how political desires are countered by existing law and regulation, would also not be a bright prospect. To the extent that administrators do occasionally serve as barriers to the advance of programs and ideas, this does not necessarily represent a negative outcome. History is replete with occasions when administrators have made malevolence possible, instead of maintaining neutrality and insisting on what is morally and ethically right, orders given to them notwithstanding.

Knowing when to pull away from responsiveness is, itself, a hallmark of bureaucratic competence. It is not a paradox to recognize that the public service is accountable to all of society, not just political forces, even if elected officials represent the public. The election of an individual to office does not represent a blank check for the public's consent; an administrator blindly following officials' dictates may demonstrate a particularly offensive form of incompetence, in that such malfeasance could violate the public's trust in government.

## Conclusion: Contextual Considerations for Bureaucratic Competence

The instrumental side of bureaucratic competence involves "specialized education and a continuous work activity" – allowing for familiarity and agility with the work process of a particular organization/agency, an impartial mindset in service delivery, and a respect for hierarchy (Senigaglia 2011, p. 59). This basic aspect of competence permits an official to learn and respond effectively to changing circumstances (Feldman 2005). However, bureaucratic competence is not limited to instrumental capacity of public officials, as competence also involves "cultural sensitivity to different cultures. . .and ethical integrity with regard to own culture" (Wilson 2010, p. 95). Attention to the context of the governmental enterprise from a cultural perspective and cognizance that administrative practices must be appropriate to organizational context are both important attributes that determine whether a bureaucrat can accomplish his or her function effectively (Wilson 2010).

It is important to consider that public agencies are not fully independent – they have particular considerations, but ultimately agencies seek to contribute to the well-being of the government as a whole and in turn providing benefit to society. Agencies should demonstrate usefulness to the broader enterprise, lest they risk being seen as, or becoming, irrelevant (Weimer 2005). This contributes to a perspective on balance between neutral competence and political responsiveness that is increasingly accepted – both too much and too little political control of administration are undesirable. Too much interference leads to adverse impacts just as too little attention from political forces can yield underperformance. Even where political appointees serve as heads of agencies, the quality of an agency's work has more to do with the rank-and-file staff that make up the bulk of the organization. Both political and administrative forces would do well to avoid bias in perspective of the other, as both are essential to the prospect of good governance (Krause et al. 2006), showing dependence on one another through complementarity (Svara 2001). From the perspective of government executives, what is needed is an administration not "neutrally competent" or "responsively competent" – both capacities are needed (Hollibaugh 2014).

In support of maintaining bureaucratic competence, consideration might be given to the protection of tenure for administrators, and attention to the idea that administrators have great concern about policy areas where they serve as advocates. Allowing administrators their role in directing policy is appropriate and recognizes their knowledge, which they have obtained because they care about public benefit and concerns larger than themselves as normative matters, to use their skill in support of the larger goals of government (Gailmard and Patty 2007). Quality comes from attention to and achievement of the delicate balance between the will of the people spoken through political voices, and the function of administration in doing the people's work and achieving public-centered goals.

# Competency-Based Management in Public Administration

Natalija Shikova
International Balkan University, Skopje, North Macedonia

## Synonyms

Competence; Competencies; Competency management

## Definitions

*Competences* are knowledge and attitudes combined towards a particular goal. Competency comprises skills, approaches (beliefs and values), abilities, and capabilities (means and resources) that the employee can possess and can utilize in reaching personal and organizational development.

*Competency-based management* is a systematic action aimed towards the creation of competency standards whose implementation should increase the human capital and efficiency of an organization.

*Public sector* is a set of public institutions that coordinates the interests of the various social groups. The public administration implements the government policy, exercises the powers, and fulfill a variety of duties towards the protection of the public interest.

## Introduction

The competency management was introduced in the 1980s in the public sectors in the United States and in the United Kingdom, in parallel with the introduction of New Public Management as a response to the needs for organizational and cultural changes (Horton et al. 2002). The modifications of New Public Management spread throughout Europe and the OECD countries and within the advanced human resources practices and competency management alike.

Although competency management is not unusual for the private sector, as a part of the public reform processes more and more is used in public administrations around the world. The reasons lie in the notion that the application of competence-based management in the public administration can improve the processes of recruitment and selection of the civil servants, their career development, as well as the organizational performance (Bonder et al. 2011). Usually, the public sector organizations are introducing the competency management responding to the need for change. The changes can refer to the changes in the work, as a result of the external pressure (globalization, financial crisis, and an aging workforce) or the changes in the organizational structure. Competency-based management enables organizations to build the internal capacity that can respond to those challenges (Nunes et al. 2007) .

Introducing competency-based management can be as well a result of broader reform. Since in the past 20 years, the public sector organizations throughout the world (especially in post-communist countries that moved from traditional systems of public administration towards liberal democracies and market economies) have been subject to major reforms, the competency management should serve in supporting those changes (OECD 2009) .

## The Competency

Despite the large variety of definitions of the concept of competency, all the competences involve knowledge and attitudes combined towards a particular goal. Competency comprises skills, attitudes (beliefs and values), abilities, and capabilities (means and resources).

The different schools are providing a separate understanding of the concept of "competency." According to them: (1) the competency represents a specific expertise or accomplishment; (2) it comprises specific behaviors contributing to excellence; (3) the competency encompasses a minimal level of job proficiency. For all of them, the "competency" goes beyond the traditional knowledge, skills, and abilities towards job-related motives, traits, and self-concepts. In that respect, the definitions of the "competency" can be grouped into three distinct approaches that consider the competencies as educational standards (crafts and technical skills), behavioral repertoires (motives and personality traits), and organizational competencies (competencies for competitive advantage – a business approach).

Despite the variety of opinions related to the definition of the concept, the literature is clear that the competency enables an employee to fulfill professional duties on a required level but as well helps the employee in its future development and increase its potential for performance. In that sense, the performance (based on competences) can be observed, measured, and evaluated. Since the competence is a social construct and it is depending on the evaluation of the actions, by others in a particular situation at a particular time. In that respect, what comprises a competent performance is not fixed and what is "competent" depends on the context in which the judgments are made. In the public reform processes (especially in the post-communist countries), the competencies are connected with the introduction of a merit-based system and the depoliticization of the public administration.

## Competency Development in Public Sector

The public sector is a set of public institutions that coordinate the interests of various social groups involving a plurality of activities. By the broad approach, the public sector is defined upon using two sets of criteria: (1) formal criteria based on ownership, funding, and authority, and (2) creation of public value. Consequently, the organizations are categorized as public when they are government-owned; government-funded; when the political authorities are the primary stakeholders; and when they are providing public value for the citizens. The public sector in most countries is a sizeable employer, providing a large number of diverse business activities and a wide range of services. The government administration influences the quality of citizens' life. Its main role is to guarantee professional and a politically neutral execution of the set objectives and this role can only be ensured only by competent and professional staff. Competence development means implementing new methods of management and control in the public sector. It is intended to promote professionalism, knowledge, and ethical commitment of civil servants in fulfilling the administrative tasks.

### The Separate Public Sector Fora

The competence development in the public sector was closely related to the dominant neo-liberal political conceptions (such as lifelong learning, New Public Management, market orientation, and decentralization) that directly influenced it. Although competence development is a key concept of modern management both in the private and the public sector, its means and the practice vary in both of them respectfully. The

differences are many, and as one often envisaged is that the public sector environment is not competitive in the same way as the private sector. The private sector organizations tend to maximize profit, whereas the public sector organizations do not. Although there are numerous related competencies applicable in both spheres, there are many differences especially the ones connected with the values and ethics in the provision of the public services. Additionally, the public sector is highly regulated and highly institutionalized. The budgets are limited as well as the resources that are open to public scrutiny (Kalleberg et al. 2006). Public sector organizations, due to their societal strategic roles, tend to be more heavily influenced by external factors involving various stakeholders. Nonetheless, government organizations seem prone to top-down and directive forms of leadership that often result in micromanagement and leave less room for learning, innovation, and growth. In that line, the motivation-enhancing practices (such as financial incentives) are not so much at disposal.

All of those abovementioned characteristics make the public sector a distinct environment in which the competencies need to be further contextualized.

### Competencies and Public Sector Reforms

In contemporary time, the public administration must be able to cope with the rapid changes in the social, economic, and technological sphere to fulfill its responsibilities towards protection of the public interest. The need to improve competitiveness, maintain fiscal sustainability, and provide better public services at lower possible costs has prompted extensive public sector reforms. The public sector reforms are occurring as a need because of the increased organizational complexity of the state administration, its functions and processes, external relationships, and the change of the nature of administrative action that in contemporary times is citizens oriented. The recent trends are towards reinventing, downsizing, or rightsizing the government organizations and departments, and that goes alongside with the economic challenges and budget deficits. The strategic documents upon the public administration reform are based on the principles of good governance (in most of the post-communist countries in Europe they are related and closely linked to the European integration process and done upon the principles that are existing in the European administrative space, such as legal security, participation, accountability, efficiency, and effectiveness in service delivery). In the reform processes, the key factor is the people who make the organizations since the reforms are depending on people's competences to undertake them.

## Competency-Based Management in the Public Administration

Competency-based management is a systematic action that assumes the creation of competency standards in which implementation increases the human capital and efficiency of an organization. A competency-based approach puts an employee at the focus of the organization and underlines his/her importance to reach the organizational objectives.

Competency management means identifying the competencies, constructing a competency framework (model), and using it as the foundation for recruitment, selection, training and development, rewards, and other aspects of human resources management.

As a practice, the competency management is important in private and in public organizations, helping them to attract and develop the talented employees, to transform the bureaucracies into the efficient and flexible unites and to change the organizational culture. Especially, in the public sector, the competency management requires anew understandings in respect of the development of the careers, since in the traditional public sector, the careers are based on qualifications, exams, and seniority, while with the introduction of the competencies the emphasis is put on people advantages (Op De Beeck and Hondeghem 2010).

However, the acceptance of a competency-based approach causes a change that needs to be implemented within the planned program. The success of its introduction depends on many

factors, and the most important is the support from the top management and having a clear communications strategy on how to communicate the envisaged changes. The prospect of success has the competency management system that is created through continuous dialogue with the people that supposed to work within. Alongside, the competencies need to be integrated with other human resources (HR) processes such as training and development.

Following the competency approach, the organizations should create a competency model, as a simple catalog that specifies the desirable competencies. Once the overall framework for competency-based management is developed, the best way is if the organization connects the identified competencies with the individual job. An alternative approach to identify the competencies based on the individual job and after transforming them into the competency's framework.

### Development of the Competency Model

The identification and assessment of competencies, as well as the development of competency-based management frameworks (a competency model), are important since they support the recruitment, learning, and other human resource processes. There is a broad difference among the countries is respect what is considered to be a desirable competence for certain public administration jobs.

The creation of a competency model (framework) starts with the identification of strategic fields of the organization, such as its mission, vision, and strategy and converge them with the human competencies. In that respect, the Individual competencies should be chosen, organized, and developed so they contribute to the realization of the strategy of the organization. The competencies that are used in the model need to be defined in a clear and understandable way (as another method can be used for creation of competence profiles that describe appropriate job standards in the organization). Competencies need to be demonstrated, observed, and assessed. In that respect, regardless of the approach, a competency model should provide an operational definition for each competency together with measurable or observable performance indicators or standards against which the individuals can be assessed.

Every organization has own framework (model) and the frameworks usually list a different number of competencies that can be grouped into clusters. It is suggested that their number should not be too extensive and should envisage the smallest number of critical elements important for a job (the concern is that, if competency framework is broad and vague, it is difficult to apply it and to assess; on the other hand, if competencies are broken down into too many criteria, the list can become unmanageable) (Pickett 1998). The appropriate approach is to identify a small number of key or "core" competencies. For the purpose of competencies measurement, within the framework (model) there are levels that can be fulfilled by the particular employee. Each level is building on the levels below (i.e., a person demonstrating competency at level 3 should be demonstrating the competencies levels 1 and 2).

Once competencies are established, it is important to define standards of performance, against which an individual's accomplishment of competency can be done. For that reason, it is important to set key indicators that should determine the effective presentation of a competency. Those indicators should provide a clear and consistent sense of what is expected from the individuals in the civil service and upon them, the possession of the competency should be assessed.

Universal or generic (general) competencies are those which are applicable across all the roles in the organizations. Besides the generic, there are specific competencies related to the specific abilities, relevant for specific positions for which specific knowledge is required.

The final stage of the creation of the competency model is it introduces it into all spheres of HR Management in the organization. The established framework (model) should be used for recruitment, performance management, and the employees' development (Marrelli 1998).

### Competencies and the Recruitment of the Civil Servants

Job competencies are particularly important in the process of selecting new employees and

workforce planning. In a competency-based selection process, the competencies that are needed for the vacant position are used as the selection criteria. The selection instruments are based on these competencies and the candidates for a specific position are evaluated against each required competency.

When choosing an appropriate candidate for a particular job position, it is necessary to focus on all working competencies needed for that particular job. Within the competency-management system in the public administration, the selection and requirement process should be based on the principle of equality, openness, and transparency and selection of the best candidate for the position. The engagement that is conditioned upon the competencies should guarantee a professional capacity and equal opportunity with no discrimination of the candidates on any possible basis.

### Competencies and the Performance Appraisal of the Civil Servants

Once the candidate is selected, the hired civil servant should be informed about the main tasks and responsibilities that need to perform applying the necessary competencies. Besides the selection of the best candidates for employment within the administration, the basic idea in introducing competency-based management is to develop and valorize the individual capabilities of an already employed civil servant. In general, it is about creating an enabling environment and improvement of the procedures not only for selection and requirement but as well as for the professional development of the civil servants. In that respect, the competencies can be used for creating a personal development plan. The individual plan for the employee can serve for improvement of his/her competencies and with that the job performance. In that sense, all the organizational learning activities, such as a workshop, courses, e-learning. . . need to be created in that manner.

Competencies envisage what to expected from the employees while performing their job. The performance is evaluated against the objectives connected with the specific job position and competency requirements. The performance appraisal of the civil servants, based on the required and applied competencies, should improve the individual performance but at the same time should increase the overall performance of the institution. As a complementary practice, competency-based remuneration systems or rewards for the employees can be established. Upon that, certain individuals can be rewarded or the salary can be increased based on competency development. This practice should address the anomalies connected with the lack of the objective criteria for merit-based promotion and diminish the demotivational influences.

## Challenges

There is a lack of empirical research on the effectiveness of competency models in the public sector. Despite the many-pointed benefits, competency-based management in the public administration has own challenges. The biggest challenges are coming from the public sector specifics. Additionally, competency management is rather a complex process and depends on the top management support, the way of communication, and consistency in the process of implementation. In many public administration (especially the ones coming from the post-communist countries), there are past legacies that are playing their role, and evidently, there is a gap between the theoretical explanation and factual implementation, between the set legal frameworks and applied solutions.

## Conclusion

The competency management system and the competency framework set out the core skills that civil servants need to have to perform the job within the public administration. The competency framework supports the merit requirement, career planning, and development of the civil servants by setting the conditions that need to be fulfilled. In those frames, the civil servants should

realize their full potential and should provide good quality services to the citizens. The competency-based management serves to strengthen the system of recruitment, and performance appraisal of the civil servants and ensures more efficient and effective execution of the working tasks. The competency management system can stimulate fair treatment in regards of professional development of the civil servants and although have own challenges, it is a basis for modernization of the public administration towards modern society requirements.

# Competition and Nonprofit Organizations

Barry D. Friedman
University of North Georgia, Dahlonega, GA, USA

C

## Synonyms

Conflict over resources; Encroachment into profitable industries; Rivalry

## Definition

Rivalry between nonprofit organizations and other nonprofit or for-profit organizations to command patronage or loyalty from the same customers, clients, or partners.

## Introduction

Nonprofit organizations are participants in an intensively competitive marketplace. They compete with other nonprofits and, in fact, with for-profit firms and governments. Nonprofits need resources, so that they are in competition with every other entity that is trying to obtain resources. They must compete for donations, grants, clients, qualified professionals, capable volunteers, coverage in the news media, support of community leaders, and the public's affection and loyalty. In some cases, the competition is direct, as when a nonprofit hospital competes with proprietary hospitals. In other cases, the competition is indirect, as when a nonprofit symphony is competing for the same attendees who might otherwise patronize a nightclub.

That the distinction between nonprofits and profit-seeking corporations has blurred in the United States is also apparent in decisions by US courts and the Internal Revenue Service to confer charitable status on nonprofits that concentrate on commercial activities. Some of the better known commercially oriented nonprofit organizations in

the United States include Underwriters Laboratories, Inc., and Blue Cross/Blue Shield. Blue Cross and Blue Shield evolved from small, voluntary plans for prepaid medical expenses. The largest such plan was founded in 1929 by Baylor University Vice President Justin Ford Kimball, in response to his observation that a large proportion of debts that went bad at Baylor's medical facilities was associated with local schoolteachers. Only in recent decades, as other insurance companies complained about the difficulty of competing with the tax-exempt Blue plans and – in many cases – conceded health insurance entirely to the Blue plans, have state governments exhorted Blue Cross and Blue Shield organizations to reorganize as for-profit corporations. Commercial testing laboratories that compete with Underwriters Laboratories (UL) have similarly complained about their inability to challenge UL in the marketplace because of UL's tax-exempt advantage.

Over many decades, the US Congress, Internal Revenue Service, and courts have refined the distinction between taxation of nongovernment organizations' "related" commercial activities and their "unrelated" activities. "Related" commercial activities tend to be tax-exempt while "unrelated" commercial activities tend to be subject to the "unrelated business income tax." The Basic World Tax Code, which was developed by the Harvard University International Tax Program and guides tax reformers worldwide, imitates the US government's differentiated treatment between taxation of nonprofits' related and unrelated commercial activities. The national tax laws that pertain to nonprofit organizations vary around the world, and the inevitable complexity of such laws eliminates any possibility of uniformity from one country to another. The US Internal Revenue Code is generous to charities. Some developing countries' legislatures have yet to enact laws offering tax advantages to charities. In the United Kingdom, nonprofits may conduct commercial activities only through a for-profit subsidiary that transfers its revenues back to the nonprofit without any payment of tax. Canada's stringent laws do not allow nonprofits to conduct unrelated, surplus-generating commercial activities. Nonprofits in India stand to forfeit their tax-exempt status if they earn revenue from unrelated commercial activities. Tax provisions of laws of several Latin American nations are described in the entry in this encyclopedia titled "Alternative Marketing Strategies in Nonprofit Organizations."

## Reluctance to Recognize Competitive Environment

The fact that resources are scarce inevitably places every consumer of resources in competition, essentially, with every other consumer of resources. When a charity fund-raiser tries to persuade an affluent individual to make a $60,000 donation, to the prospective donor the charity's solicitation may be competing with her contemplation of purchasing a $60,000 automobile. Nonprofit managers are reluctant to think of their organizations as being so frantically competitive. They prefer to think of themselves and their organizations as cooperative and collaborative with the environments in which they operate. But any number of factors make the nonprofit sector at least as competitive as the others. Nonprofits are created at a brisk rate, partly because they tend to be not capital-intensive but labor-intensive, so that the cost of opening the office door may be relatively modest. Unfortunately, many nonprofit managers who could not come to terms with the competition for resources in which they were inescapably involved failed to bring success to their organizations.

In the final analysis, not all nonprofit organizations will survive the competition. Inevitably, the poorly managed nonprofits will fade away. Energetic, effective nonprofits will attract a disproportionately large share of resources, which will lead to outcomes that will benefit society. This is a desirable result in a free marketplace.

## Structure of Competition

One need only retrieve the contents of her postal mailbox or her E-mail inbox on any given day to appreciate the intensity of the competitive environment in which nonprofit organizations operate.

A plethora of eleemosynary organizations solicit donations from any particular individual. Making one donation brings four other charities out of the woodwork, and the solicitations continue to multiply.

According to the "2016 Global NGO Online Technology Report," produced by the Public Interest Registry based on research by Nonprofit Tech for Good, a survey of 2780 nongovernment organizations from 133 countries showed that the average African NGO has 2079 Website/E-mail subscribers and 4327 Facebook "likes"; the average Asian NGO has 9694 subscribers and 12,372 "likes"; the average NGO in Australia/Oceania has 32,352 subscribers and 27,783 Facebook "likes"; the average European NGO has 55,861 subscribers and 28,615 Facebook "likes"; and the average North American NGO has 41,084 subscribers and 24,284 Facebook "likes."

Managers of nonprofit organizations understand that the survival of the organizations depends on the managers' ability to secure a generous constituency. Success in this arena tends to require techniques that rival the efforts of the corporate sector in terms of professionalism and determination. Nonprofits must be able to explain why they, more than others, deserve the support of donors, clients, and others who have a choice.

Barry (1997) has described strategies that are used by many nonprofits in this competitive arena. They include:

- Clarification of the organization's mission and goals, approach to accountability to stakeholders, approach to revenue attainment, resource management, and promotion methods.
- Mergers, consolidations, joint ventures, and sharing of services with one or more other nonprofits.
- Determination of a clear, distinctive role – or "niche" – in the community.
- Decisions to "downsize" or "rightsize."
- A focus on one or two success factors.
- Engagement of the community as an ally.
- Replication of others' successful approaches.
- A focus on the *causes* of society's problems rather than on *symptoms* of such problems.
- An entrepreneurial approach to increasing earned income, such as profitable ventures.
- A focus on the "big picture" through development of ultimate goals and broad visions, creation of a "can-do" culture of getting things done in the face of obstacles, hiring of initiative-taking employees, empowerment of employees by authorizing them to do what is needed to get the job done, and development of structure and information to enable members of the organization to move forward.
- Updating of the organization's approaches to programming and fund-raising.
- Attention to challenges that typically arise when an organization is in this organization's stage of development, such as a founding stage, a growth stage, or an institutional stage.
- Awareness of sweeping trends in the organization's industry.
- A balance between exploration – when the organization is trying to define its direction – and operating – after the organization knows just where it wants to go.
- A commitment to nurturing the organization's relationship with clients, board members, employees, other organizations, and other stakeholders.
- A rekindling of the directors', managers', employees', and volunteers' passion.

Peattie describes how British and other nonprofit organizations use "sales promotion" – such as discounts and coupons – to gain an advantage over competitors. An example in Britain is the Oxfam shops' buy-one-get-one-free offers on clothing. The Smokefree Class Competition, a European smoking-prevention project, offers chances to win cash prizes to classes whose students are 12–14 years old and commit to giving up smoking. City University of Hong Kong students who use their student-ID cards to purchase items in the bookshops can win a prize for each $10 spent. Donors to the Great Ormond Street Hospital's Wishing Well appeal in the Bloomsbury section of London were offered a chance to win a car in exchange for their donations (Peattie 2003).

## Controversies Arising from Competition by Nonprofits

### Advantages Arising from Tax-Exempt Status and Other Conditions

Nonprofit organizations have a significant advantage over for-profit corporations and small businesses that becomes noticeable when both of them are offering the same goods and services. The advantage results from several conditions:

- The nonprofit organization's revenue from the sale of goods or services *may* be exempt from income tax. (Under some circumstances, revenue from extensive commercial activity may be taxable despite the organization's nonprofit status. This may occur when the commercial activity is so unrelated to the purpose for which the tax-exempt status was granted that it is classified as "unrelated business income" or UBI. But as a general rule nonprofits are able to evade tax requirements, if for no other reason that the IRS does not have the resources to patrol the commercial activities of nonprofits.)
- The nonprofit organization is able to fortify its financial situation by attracting grants and donations from governments, foundations, and individuals, something that for-profit corporations can only dream about.
- The nonprofit organization can reduce its labor costs by appointing volunteers to do what the corporation must pay employees to do.
- The nonprofit organization obtains other benefits and concessions, including lower postage rates.
- The nonprofit organization has no need to deliver dividends to any owners.

The result of these conditions is that the nonprofit organization is able to charge a below-market price and still realize a surplus, while the for-profit competitor would lose money if it sells at the same price. These circumstances may be beneficial when nonprofit organizations provide "public goods" (i.e., goods or services having "positive externalities" where providing the goods or services to one segment of the population delivers benefits to other segments that are not participating in the arrangement). However, these circumstances are not particularly desirable when a nonprofit organization is providing goods and services that are already provided, or that would otherwise be provided, by profit-seeking corporations. Another result is that inefficient methods used by the management of a nonprofit organization do not impair the continued functioning of the nonprofit organization; the infusion of donations and free labor provides "slack" for the organization, while, in theory, profit-seeking corporations can ill afford "slack." An example involves the United Way of America, a national US fund-raising association whose local affiliates are confederations of local human-service organizations. As investigative columnist Jack Anderson reported on February 14, 1992, "the United Way board 'took a resounding vote of confidence' for United Way President William Aramony" as reports circulated about how the organization's headquarters was draining $30 million out of the annual nationwide collections of $3 billion and providing "perks" to "double-dipping executives."

The advantages disturb business executives and proprietors. "Nonprofit groups have cultivated these competitive strengths for many, many years, and they have launched a deliberate assault on tax-paying, for-profit businesses," said Kenton Pattie, executive director of the Business Coalition for Fair Competition in the United States. The criticism arises from "food-service outlets, testing laboratories, bookstores, computer dealers, travel agencies, tour companies, recreation centers, plant nurseries, day-care centers, hearing-aid technicians, veterinarians, blood banks, consulting engineers, medical-equipment suppliers, pencil manufacturers, specialty advertisers, hotels, printers, construction companies, laundries, janitorial services, waste haulers, and electrical, plumbing, heating, and air-conditioning contractors" (quoted in Hawks 1997, pp. 95–96). Hawks reported that more than 1000 delegates to a 1995 White House Conference on Small Business adopted a resolution asking the president and Congress to "enact legislation that would prohibit government agencies and tax-exempt and antitrust-exempt organizations from engaging in

commercial activities in direct competition with small businesses" (Hawks 1997, pp. 95–96).

### Acquisition of Influence Through Lobbying and Government Regulation

Many nonprofit organizations have set into motion an interesting vicious circle, in which they lobby the government for funds and then use some of the funds to lobby the government for more funds. Officially, using federal subsidies to lobby and to engage in other forms of political activity is illegal. However, in so far as money is fungible, it is feasible for a nonprofit to claim to use the federal money for charitable purposes and *other* money for lobbying without impairing the organization's ability to do whatever it wishes. In 1997, Republican members of the US House of Representatives complained, according to a report in *The New York Times*, "that eight groups, including the American Association of Retired Persons, the United Auto Workers, [the] AFL-CIO and the Sierra Club, received $99.9 million in federal grants in 1994, then spent $5.5 million 'attacking Republican members and lobbying against GOP legislative proposals.'" Early in 1977, the House passed a "Truth-in-Testimony" rule that would require an organization that receives government funding to disclose the arrangement whenever it testifies before Congress.

Nonprofit organizations have sought legislation from Congress and state legislatures and decisions by federal and state officials to limit the activities of competitors. The American Cancer Society, for example, persuaded Pennsylvania Attorney General Ernie Preate Jr. to sue the Cancer Fund of America with the accusation that it was confusing donors (Bennett and DiLorenzo 1994).

Another strategy used by nonprofit organizations is to arrange for regulatory agencies to obstruct the entry and involvement of competitors. An effective approach is to prevail upon the agency to obstruct entry of competitors (e.g., through a franchise arrangement or through the denial to a hospital of a "certificate of need") on the principle that services should not be duplicated.

The economists Bennett and DiLorenzo (1994) describe similar efforts by health charities in the United States to secure legislation to obstruct the efforts of competitors. The American Cancer Society, American Heart Association, and American Lung Association have complained about "look-alike organizations" that try to draw donors away from the well-known charities by using similar names and deceptive or fraudulent fund-raising practices. Representatives of the three organizations, including American Cancer Society chairman Keith A. Greiner, called for legislation to deter the "illegitimate" fund-raising. "Fund-raising by the look-alike organizations... ought to be stopped," Greiner testified. "The best interests of the public are not being served by what look-alikes do, and therefore, some legislation ought to be in order." Bennett and DiLorenzo (1994) characterize the large charities' demand for legislation to shut down the look-alikes as less of an effort to promote the public interest and more of an effort to monopolize charity work in their respective illness specialty areas.

### Discrediting Competitors

Some nonprofit organizations compete by attempting to discredit their competitors. The American Cancer Society's *Manual for Dealing with Look-Alike and Sound-Alike Organizations*, submitted as evidence in congressional hearings about look-alike organizations, boasts, "No other private organization can match the reputation the American Cancer Society has earned." This manual instructs ACS employees to write letters to the editor of local newspapers that criticize organizations that compete for funds with ACS. (The manual also advises the employees to conceal their status as employees of the society.) The sample letters describe the look-alikes as "cheaters" and "flim-flam men." Joyce White, deputy managing director for administration of the American Lung Association, denounced look-alike organizations "who would deliberately mislead and deceive the American public" (Bennett and DiLorenzo 1994, pp. 210–214).

A far more extensive effort to discredit competitors has been maintained over the years by the American Red Cross, which has worked

relentlessly to discredit other blood banks, especially blood banks that pay blood donors for donating. The ARC has insisted that blood from unpaid donors is safer than blood from paid providers, stating on its Web site in 1999, "Under no circumstances will the Red Cross pay blood donors. Donors who give blood for reasons other than benevolence could potentially compromise the safety of the blood supply."

Blood banks that paid people to donate blood repeatedly insisted that there was inconclusive evidence that volunteer blood was safer than paid blood; in fact, those blood banks warned that there was more danger associated with a shortage of blood. However, the repeated insinuations by the Red Cross that volunteer blood is safer than paid blood put the paid blood banks on the defensive, and most of them disappeared because they could not compete successfully in the hostile environment that ARC had created for them.

### Applying Disincentives for Clients to Cooperate with Competitors

In extreme cases, nonprofit organizations may attempt to undermine competition by creating difficulties for clients who are motivated to do business with competitors. *Boston Globe* reporter Aaron Zitner described the lamentations of St. Joseph's Hospital in Atlanta that objected when the ARC refused to fill an emergency order for blood products. Zitner concludes that this competition has taken on a peculiar ferocity that may imperil patients: "Founded as nonprofit social service agencies, many [blood banks] are acting more like cutthroat businesses – poaching one another's donors, undercutting one another's prices and shuffling alliances with hospitals in ways that some doctors believe has put patients at risk."

## The Alternatives of Competition and Cooperation

Bryce (1992) analyzes the options that are available to nonprofit organizations when they are confronted with competition. When two nonprofits focus on the same target market with the same product or service, such that an increase in the quantity supplied by one must come at the expense of the quantity supplied by the other, they are involved in a zero-sum game. Says Bryce, "Options may be active, passive, defensive, or aggressive." Nonprofit managers may need to anticipate and account for the consequences of counterstrategies of the other competing organizations (Bryce 1992).

Meanwhile, pressure is often placed on nonprofits to work together. Philanthropic sources and governments, which competitively offer grants and contracts to nonprofit organizations, pressure the nonprofits to collaborate with each other (La Piana and Hayes 2005).

Contrarily, nonprofits operating in an environment with multiple qualified service providers may endeavor to develop a nonzero-sum game involving cooperative strategies. These strategies, involving other nonprofits or involving for-profit firms, include the following:

**Co-production** Co-production refers to the cooperative involvement of multiple actors in the environment – a private or public foundation, public officials, private-sector leaders, clients, and other individuals. A foundation, a government, or a profit-seeking entity may be motivated to involve a nonprofit in a necessary function based on the expectation that the nonprofit has characteristics and advantages that will allow it to do what the other organization cannot effectively accomplish. For example, a police department may seek to draw in one or more nonprofits for the purpose of obtaining citizen participation in decision-making and outreach to groups and individuals in the community. Bryce (1992) observes that co-production may subject the nonprofit to substantial interference by the other entities involved in the co-production.

**Transactions** A for-profit firm and a nonprofit organization may be able to develop a transaction that has financial advantages for both. Bryce offers the example of a nonprofit organization collecting donations that fund the construction of a building. The nonprofit may then sell the building to a for-profit firm and lease office space for

itself from that firm. The nonprofit thus profits from the construction and sale of the building. The firm collects rent payments from all of the tenants and can do what the nonprofit organization could *not* do: deduct interest and depreciation from the rental income to decrease its income-tax liability. Each organization benefits based on the separate tax laws that apply to it. "These sale-leaseback arrangements are profitable for both parties when appropriately structured" (Bryce 1992, pp. 212–213).

**Joint Ventures** Tax-law expert Kendyl K. Monroe (cited in Bryce 1992) identified five types of joint ventures between universities and corporations. The first example is research commissioned by corporations and conducted by universities. Second, universities that own licenses and patents may allow corporations to use them for profitable activity, in exchange for royalties. Third, universities may provide consulting services by their faculty members in exchange for payment. Fourth, universities and corporations may share laboratory facilities. Fifth, universities may own the majority or a minority share of a for-profit corporation (Monroe, cited in Bryce 1992).

**Partnerships** A partnership arises when a nonprofit organization and a nonprofit partner establish a separate organization to carry out a business activity. This separate organization has its own identity and staff.

**Strategic Alliances** Strategic alliances are distinguished from collaboration that arises in response to a specific need and lasts only as long as the need persists. La Piana offers the example of a common funder that is cutting back on grants and a collective response from some number of threatened organizations. Rather, strategic alliances are more formal and designed to remain in place for the foreseeable future. An example is an agreement that a nonprofit organization will provide accounting services to other nonprofits. Another example is a corporate integration that connects two or more nonprofits through a joint venture or that involves a merger (La Piana and Hayes 2005). Today, strategic planning of nonprofit organizations often focuses on such corporate integration. "Nonprofits that want the benefits of merger without giving up control should consider alliances" (McLaughlin 2010, pp. xv, 93).

## Conclusion

Though many nonprofit managers have been discomfited over the years about conceiving of competition among nonprofit organizations, it is inevitably the case that a payment made to a nonprofit organization involves an "opportunity cost" – meaning that the client or donor has forgone some competing use of the money to make the payment to the nonprofit. While much of the competition is a natural aspect of the free marketplace, nonprofit managers sometimes become more daring in approaching the marketplace with an entrepreneurial or antagonistic strategy. The strategy may involve discrediting other nonprofits or profit-seeking firms, it may involve undertaking commercial activities that encroach on businesses' turf, or it may involve lobbying for laws and regulations that will result in a competitive advantage. When nonprofit organizations are confronted with problematic competition, they may seek to reduce their dependency on the task environment by entering into cooperative strategies with one or more partners that allow all of the cooperating parties to benefit financially while they fend off environmental threats.

# Competitive Acquisition Processes

Christopher L. Atkinson
Department of Administration and Law,
University of West Florida, Pensacola, FL, USA

## Synonyms

Competitive proposals (negotiation); Full and open competition; Other than full and open competition; Sealed bidding

## Definition

Competition is defined as "the struggle for commercial advantage; the effort or action of two or more commercial interests to obtain the same business from third parties" (*Black's Law Dictionary* 344 (10th ed. 2014)). In public procurement, competitive processes such as sealed bidding and negotiation are employed to achieve improved outcomes in price and quality of product or service for public-sector client agencies.

## Introduction

A central element of most public contracting systems is the unrestricted opportunity for vendors to bid on or offer a proposal for government solicitations. A principle of government contracting is that in order for government to obtain the best deal, competition for contracts must be open, in that any interested party may compete. Through this level of competition, which includes formal advertisement of solicitations, the system may avoid the potential for fraud, collusion, or favoritism in the award of contracts. Competition helps ensure many sellers in a market that is easy to enter, with accountability and pricing balance between buyer and seller. With too few offerors, pricing favors the offeror, and prices go up (Manuel 2011). In the public context, this is problematic, with budgets pressed to their limits by entitlements and a seemingly never-ending flow of new obligations. Competition places a business guise on the public work of government, allowing for scarce resources to be used most wisely.

This entry considers competition in public contracting, and offers a discussion of competitive acquisition processes drawn from acquisitions literature, using the US example as a framework. Allowances for other than full and open competition are also considered. The work concludes with recommendations for further discussion on the nature of competition in acquisitions, in both academic and practitioner spheres.

## Competition in Public Contracting

Competition in public purchasing has a historical basis – according to the Congressional Research Service, competition in procurement in the United States can be traced back to 1781 (Manuel 2011), but competition in procurement is not unique to the United States. Many nations around the world have competition as a centerpiece of their public procurement programs (LexMundi 2012). Competition is typically seen as a requirement, and the question given this requirement is the extent to which competition is necessary to satisfy the statute or regulation. However, the primacy of competition is tempered by a caveat, as it is in the US Federal regulations, for moderation in the face of competing priorities: "Contracting officers shall provide for full and open competition through use of the competitive procedure(s)... that are best suited to the circumstances of the contract action and consistent with the need to fulfil the Government's requirements efficiently"

(FAR 6.101). While competition is important, it is important along with other priorities, like meeting efficiency expectations and agency timelines for requirements.

In order for competition and formal advertisement of an intent to contract through a solicitation to make much difference, government must be clear enough in its description of its intended purchase to be meaningful to potential vendors. Ambiguity introduces uncertainty for vendors, creates delay, and potentially increases costs for government as vendors seek to afford additional considerations that may be unwarranted or undesired. At the same time, ambiguity can favor vendors that respond to unclear solicitations, forcing government to address a protracted procurement process, potentially with protests and other delays. Competition is rooted in a sufficient vendor pool and in giving that vendor pool enough time to respond to a solicitation. The effort to afford competition will necessarily fail without due consideration to detail in the solicitation, sufficient vendor pool, and time to consider the solicitation and develop a response (Nash and Cibinic 1977).

Even with competition as a requirement, there may be limitations that are allowable under applicable rules. The government entity may remove some sources from consideration, reducing the potential vendor pool when there are adequate reasons for doing so (e.g., in the interest of national defense); governments may also engage in set-asides for small businesses or afford additional considerations as an affirmative benefit to businesses representing socioeconomic categories. Small purchases may also be afforded a reduced standard for competition (Cibinic and Nash 1986). Other limitations on competition, such as multiple award schedules and basic engineering proposals, have been allowed for under various legal exceptions (Manuel 2011). These approaches can streamline procurement, introduce additional social and political value into a process, or allow latitude for contracting officers to make decisions that fit a specific requirement; from another standpoint, these exceptions potentially limit competition and keep vendors interested in government contracting away from solicitations.

## Types of Competition in Acquisition

In the case of the US Federal government, competitive procedures take the form of sealed bids or competitive proposals (negotiation). The choice to use sealed bids or proposals is informed by what is being procured: if the requirement is a new solicitation for office supplies, for example, the approach to solicitation might involve sealed bidding; if the project involved the services of consultants, with an indeterminate scope of services allowing for a great deal of creativity in response, then the approach might more properly involve solicitation of proposals and a subsequent negotiation.

Per FAR 14.101, "Sealed bidding is a method of contracting that employs competitive bids, public opening of bids, and awards." Under sealed bidding, the requirements must be clearly stated in the solicitation document, and specifications that restrict access by vendors are not allowed. The solicitation is publicly advertised to encourage bidders to respond. The resultant "sealed bids" are submitted at time and date certain and opened in public. There is no discussion of the bids received. Awards are made on the merit of the bids received, considering pricing factors. Sealed bidding operates on the principle that "it is in the government's best interest to take advantage of the competitive forces in the marketplace. In theory, when there are numerous independent contractors, each having an opportunity to compete for the government's business, the lowest bidder will be awarded the contract" (Engelbeck 2002, p. 153). In sealed bidding, the risk is on the vendor for delivery and performance. The sealed bid may request all information in one response, or may request a technical proposal, with the pricing information provided separately (Engelbeck 2002).

Negotiation is "a method of contracting that uses either competitive or other-than-competitive procedures that permits bargaining with the offerors after receipt of proposals. Any contract award without the use of sealed bidding procedures is a negotiated contract" (Nash et al. 2007, p. 392). Discussion of quality and

weakness in the offer, performance and other factors, and price details can be included in negotiation discussions. Award in negotiated contracts "can be made on the basis of technical excellence, management capability, personnel qualifications, prior experience, past performance, and other factors" – not just price (Nash et al. 2007, p. 392).

With proposals and negotiated contracts, the risk shifts substantially to the government. Negotiated contracts nevertheless make up a substantial portion of all contracts with government entities, due to the unique nature of government requirements for products and services. A request for proposal (RFP) details the requirements and specifications, to the extent that they are known, to potential vendors or providers (Engelbeck 2002).

Sealed bids are most appropriate when a sufficient vendor pool exists to provide responses to the solicitation (so that comparisons can be made among the various responses, in terms of price); if the review mostly involves comparisons of price, and discussions with vendors are not necessary to clarify any aspects of the projects that may be considered vague, then sealed bids are most appropriate. If the requirement in question does not meet the usual standards for a sealed bid, then a request for proposals and negotiation scenario is needed (Cibinic and Nash 1986). A two-step process may incorporate elements of sealed bidding and proposals, as allowed for in FAR 6.102.

Sealed bidding results in contracts that are firm-fixed-price contracts or fixed-price contracts with economic price adjustment, per FAR 16.102. Contracts for proposals and negotiation scenarios can take a wide range of forms, depending on the particular nature of the requirement, urgency of the procurement, and period of performance, among other factors. Part 16 of the Federal Acquisition Regulation includes a list of contracting types that may result from competition in proposal/negotiation situations; this list provides a ready reference that forms a useful general toolkit for contracting approaches in other public venues, as styles frequently overlap.

## Restriction of Competition

Noncompetitive procurements have been regularly limited in procurement codes and acquisitions regulations, consistent with a stated legislative preference for full, open competition. However, there are instances where rules afford contracting without a full competitive process. Using the US example, the Federal government affords a number of occasions where other than full and open competition may be warranted. A contracting officer may have great authority to limit competition, especially when emergency scenarios or protection of life is involved (O'Connor 2007).

Per FAR subpart 6.3, other than full and open competition is allowed for in certain situations: "Only one responsible source and no other supplies or services will satisfy agency requirements." A sole source procurement involves the contracting officer concluding that "only one source can provide what the government needs, so the contracting officer does not do full and open competition" (O'Connor 2007, p. 9).

Other instances allowing for other than full and open competition include "Unusual and compelling urgency," research, and expert services, where the option is required by law, in the case of international agreement, in the interest of national security, or, vaguely, in the "public interest" (FAR subpart 6.3). In all such instances, the contracting officer must justify the rationale, fully document the reason(s) for the decision, and have approval for the decision.

Other levels of government allow for emergency procurement and sole sourcing and often have similar requirements for showing justification and documentation of the decision. In some scenarios, a sole source procurement may involve the availability of only one "reasonable" source. Requiring a sole brand can also limit competition, but may be appropriate in some cases, such as providing for continuity and interoperability with existing equipment and systems. Typically, documentation of the justification for decision-making, the rationale for choices made, and the approval for the deviation from full competition are relevant considerations. Supporting any subsequent reviews of contracting files with a clear and comprehensive file

presentation allows the contracting officer to defend actions taken and make clear to future reviewers the context of the decision and why the choices made were appropriate.

## Conclusion

Beyond the economic and business case for competition, it is in the interest of transparency and accountability that competition remains such a vital part of public procurement throughout the world. Using principles that draw from business sensibility, the government buyer can help to ensure a good deal is made for their client agencies. However, in an era of increasing time constraints and resource pressures, the consideration of competition must vie against other priorities, including some factors that contribute to questions of organizational and career survival in especially political environments. Competition is time-honored, but its best use and results can suffer from neglect in an under-resourced public purchasing environment. Academic work in this area might focus on the gap that exists between intent and reality of outcomes for competition, especially in international contexts, where there is a need for research in this area. For practitioners, understanding what specifically can result from competition in a variety of contracts, in different venues, and how more subtle factors can contribute to success or failure, might possibly be of benefit to the practice of public acquisitions (Arrowsmith 2010).

# Competitive Sourcing

Scott Lamothe
Department of Political Science, University of Oklahoma, Norman, OK, USA

## Synonyms

Competitive procurement; Competitive tendering; Contracting out; Outsourcing; Privatization

## Definition

Competitive sourcing is a method that purports to leverage the benefits of market competition in the acquisition of government goods and services to overcome the inefficiencies associated with traditional, in-house delivery, which is seen as monopolistic in nature. Specifically, this tool requires potential providers to compete against one another by submitting bids. This allows the government to compare the competitors on price and quality and choose the entity that can most efficiently and effectively deliver the good or service.

## Introduction

Government procurement of goods and services from the private sector has a long history. For example, in ancient times, the Roman Empire contracted with private citizens for tax collection and military supplies. Likewise, the fledgling US government utilized the private sector to help supply the Continental Army during the Revolutionary War. However, most scholars trace the origins of the modern contracting movement to the 1970s and 1980s. In particular, Margaret Thatcher and Ronald Reagan, building off the groundwork laid by libertarian intellectuals such as Friedrich Hayek and Milton Friedman, are credited with ushering in a greater acceptance of the practice at all levels of government.

There are generally two primary drivers in the push for increasing levels of government contracting. The first is an ideological preference for smaller government. From this perspective, contracting with private entities helps limit the size of government, since far fewer public employees are needed to sign contracts and monitor delivery than to actually deliver services directly. The second is an economic efficiency argument. That is, when government produces a service using its own employees, it sets up a monopolistic situation in which there is little incentive to maintain quality or keep costs down. Thus, inefficiencies and government "bloat" can be avoided if contracting with the private sector, also termed "outsourcing," is practiced. Many scholars believe that ideological concerns were at the forefront of the privatization movement in the early years, with conservatives championing the practice and liberals generally in opposition. However, as more was learned about the strengths and weaknesses of outsourcing, the practice became more accepted across the political spectrum as a practical perspective moved to the forefront; privatization came to be seen as a useful tool of public management by both sides of the political divide – not always the answer, but certainly not to be rejected out of hand.

Of course, as will be elaborated on below, simply contracting with the private sector is not sufficient to realize the purported benefits of outsourcing. The key is competition. Private sector vendors, selected in noncompetitive ways, are just as prone to monopolistic behaviors as their public counterparts. Thus, properly managed competitive sourcing is necessary.

## Why Does Competition Matter?

A central precept in classical economic theory, popularized by Adam Smith, is that a transaction will not take place in the market unless both the buyer and seller feel they are gaining from the deal. Because of this, both have an interest in hiding their true preferences, so as to try to gain the upper hand in the transaction. For example, if a seller can convince a buyer that the seller invested US $100 in resources to produce a good, when, in fact, production only cost US $50, then the seller has the potential to reap an outsized profit. It is improbable that the buyer has the appropriate information to determine if the cost claim is accurate, and acquiring such information would likely be costly; how then can buyers' interests be cheaply and effectively protected? The answer is straightforward if there are many sellers. In a robust market, should a vendor overprice a product, other sellers have an incentive to undercut that price, as they can still earn a profit while increasing their chances of making the sale. So long as the sellers cannot/do not coordinate (i.e., collude on price), each has an incentive to price as close to their true production costs as possible to keep their prices low (while still earning a reasonable profit) and improve their chances of earning sales. This not only forces sellers to reveal valuable and truthful information regarding costs through their pricing but also incentivizes efficient production to try to push costs down, thereby improving (i.e., lowering) their prices relative to their competitors.

Thus, if there are enough sellers in a market, overall resource allocation should be efficient. That is, suppliers will efficiently produce goods and services to hold down prices, and buyers will not waste their resources overpaying to fulfill their needs. But, the obvious question is "how many sellers are enough to achieve this outcome?"

## How Much Competition Is Enough?

Economists and management scholars have long tried to gain a firmer understanding of how many suppliers there must be in a market to ensure the efficient allocation of resources. It is well established, both theoretically and empirically, that monopolistic markets, containing only one supplier, are problematic. Singular vendors, who do not face competition, have no incentive to maintain efficient production, innovate to improve efficiency, or price near their costs of production, since no other sellers are available to undercut their prices. Buyers in such markets essentially have only two choices – overpay or forgo a desired (and possibly needed) good or service.

If a market has two or three sellers, there could be improvement, although there is no guarantee. In weak markets, it is possible that producers will compete; but they may, instead, coordinate their pricing strategies so as to ensure elevated profits. This, what is termed "oligopolistic" behavior, results in very similar outcomes as found in monopolistic markets – inefficient allocation of resources and artificially high prices – to the detriment of buyers. However, as the number of sellers increases, such coordination becomes more difficult as each vendor has an incentive to undercut their competitors to increase market share, which shrinks with the introduction of each new seller if coordination is maintained.

At first blush, it would appear that the entry of each new supplier has the potential to improve resource allocation in the market. However, some have argued that if there are too many sellers, competition can essentially drive profits down to zero, causing market instability (see, e.g., Keisler and Buehring 2005). Hence, it can be posited there is a curvilinear relationship between price and the number of vendors in the market; price drops as additional sellers enter and curtail monopolistic and oligopolistic behaviors, but may rise again if the market becomes destabilized and suppliers are driven out due to low (to no) profitability. What then is the appropriate size of a market for it to be stable and efficient?

While there are a number of ways to get at this question (e.g., Selten 1973 used a game theoretic approach in determining that collusion is less likely if markets have at least five participants), the most common technique has been to study public and private auctions or markets for specific goods or services to determine the impact of each new entrant (i.e., supplier) on price. While there is variance in the findings, in the aggregate, the results indicate that the third entrant is key (i.e., is associated with the largest drop in prices per entrant) but that notable savings continue through the fifth entrant. As such, it appears that markets with three vendors could be reasonably competitive, but four to five suppliers are likely superior. The entrance of the fourth and fifth vendors decreases the likelihood of collusion and increases the number of competitors, both of which place downward pressure on prices. Moving beyond five may lead to further, although diminished, reductions in price, but may also result in market instability.

## How Competitive Are Government Markets?

Governments utilize the private sector to purchase myriad goods and services. So, not surprisingly, there is a wide array of competitiveness in the markets in which governments participate. Some markets, such as those for office supplies and other commodities, tend to be quite robust and, therefore, efficient. Others, like for many of the services contracted for by government, tend to be weak, with few potential suppliers. In particular, big-ticket defense procurements, at the national level, and health and human services, at the state and local levels, are apt to have very constrained markets.

Knowledge of the market one faces is an imperative for governments attempting to procure goods and services from the private sector. A discussion of local government contracting serves to illustrate the challenges faced when attempting to employ competitive sourcing. Hefetz and Warner (2012), in collaboration with the International City/County Management

Association, queried local jurisdictions regarding the number of potential vendors available for 67 commonly provided local services in the United States. They, like many other scholars, find that, on average, local markets for government services tend to be suboptimal with respect to the number of potential vendors. Specifically, across all of the cases, Hefetz and Warner found an average of only 1.67 suppliers per service market. For only three services (vehicle towing and storage, daycare facilities operation, and legal services) did they find markets that met the minimum threshold of three, discussed above. No services reached the more desirable four or five supplier thresholds. Conversely, they found that 15 services averaged fewer than one potential supplier, which indicates that in some jurisdictions there were simply no options to traditional, in-house delivery for certain services. Overall, Hefetz and Warner's (2012) findings indicate that the markets for local services in the United States, on average, do not conform to the expectations associated with markets inducing efficient resource allocation. This is not to say that competitive sourcing may not be beneficial, but rather that public managers must be cognizant of the weak markets they are likely to face and factor this information into procurement decision-making.

## Managing Competitive Sourcing and Markets

For the reasons reviewed in the previous section, one cannot simply assume that competitive sourcing will yield desirable results. Rather, governments must be "smart buyers" (Kettl 1993), who are knowledgeable about both the markets they encounter and the goods and services they seek in those markets, in order to leverage the benefits of contracting. Competitive sourcing for services requires that governments write "requests for proposals" (RFPs), or similar solicitation documents, that explicitly state what the government wants to purchase and vendor expectations in this regard. This cannot be done properly, if governments have not invested in the contract management capacity (i.e., experience and expertise) to do so.

Sclar (2000) notes, for example, that markets may appear more robust than they truly are to governments lacking adequate expertise. Specifically, some firms that bid on contracts may not actually have the capacity to perform the desired duties. Those evaluating the bids need to be able to flag such applications and remove them from the process. It might also be the case that some of the bid prices are unreasonably low. While this makes them appear, on the surface, to be more competitive, knowledgeable managers will see them for what they are – unrealistic – and reject them in favor of bids that, while more expensive, are based on sounder fundamentals. It is important to point out that these two scenarios (i.e., undercapacity bidders and unrealistically low bid prices) do not require that potential vendors act in bad faith. Rather, it may be that a poorly written RFP misinformed bidders as to the requirements. Or, some bidders, like some governments, may lack capacity and, therefore, the ability to properly evaluate the expectations laid out in the RFP and prepare proper bids. Regardless, it is the responsibility of governments to protect themselves from such eventualities.

Further, unlike their private sector counterparts, governments may also face weakened markets owing to political and legal constraints (Johnston and Girth 2012). For example, they may be limited by rules that require or favor certain types of vendors, such as local firms or traditionally underrepresented groups. Regardless of the origin of the problem, when markets are found to be noncompetitive, there are things that governments can do to try to improve the situation. Rather than passively posting RFPs and hoping for a healthy response, governments can perform market research in efforts to identify and directly solicit potential vendors. In certain circumstances, they may also promote the establishment of new organizations that could serve as suppliers. For example, public officials could encourage local activists to form nonprofits capable of delivering government-funded social services. Additionally, government officers can increase competition by requiring public agencies to bid on contracts (Johnston and Girth 2012).

This serves the purpose of adding at least one extra competitor to the mix and also assists the government in maintaining experience and expertise in service delivery. There are a variety of other efforts that can be undertaken by enterprising governments to improve competition, but it is important to point out, they all require appropriate investments in governments' contract management capacity.

## Conclusion

Competitive sourcing is a tool that governments can use to efficiently and effectively deliver services to their citizens. However, it is not a panacea and needs to be undertaken in a responsible manner. While the benefits of competition can improve service quality and lower costs, competition cannot be taken as a given. It is imperative that governments understand this and act as smart buyers, who are familiar with the markets with which they engage, and are knowledgeable about the goods and services they wish to acquire, so that they may avoid subpar outcomes.

Further, Sclar (2000) points out that for governments to get the most out of competitive sourcing, they must go well beyond simply ensuring the bidding process is well-managed and competitive; they must actively manage the contract, post-award. While this is generally beyond the scope of this article, briefly, this entails monitoring the vendor's work and ensuring contract terms are being met. It also means working with the contractor if problems are encountered. It is imperative that the government stays engaged throughout the process and does not simply forget about the contractor until the next bid cycle rolls around.

# Complex Interaction of Administration and Law

Heidi O. Koenig
Department of Public Administration, Northern Illinois University, DeKalb, IL, USA

## Synonyms

Administrative and Judicial law; Bureaucracy and law

## Definition

Administrative Procedure Act: law that governs how cases are heard within the bureaucracy
Bureaucracy: the civil service arm of the executive branch
Incrementalism: the process by which small cases are made from existing decisions; relies on the use of precedent
Precedent: prior rulings by courts

## Introduction

The relationship between law and public administration is an active one – the complexity we see

between public administration and law was built into our system of governing. The ways laws are created at the federal and state levels of government embody the diversity of interests represented by government. In addition to multiple branches of government is the use of different types of decision-making by and within each branch. The legislative branch, serving the interests of the public, relies on majority rule. The executive branch, charged with the execution of the laws, has a single decision-maker at its head. And the judicial branch, working to maintain the structure of law, uses a form of incrementalism. The variations in decision-making activities deepen the complexity of action in the government. The implementation of policies developed by the branches leads inexorably to a discipline of public administration that must persevere in the face of that complexity.

Public administration is at the center of the governing process. Public administrators exist within the political system that builds accountability checks through the same political structure that creates the policy. Legislation, executive directives, and judicial decisions are the bases of the power of public administrators to implement public programs. Administration is the embodiment of the law – without implementation, policies are mere exhortations of political preference. At the same time, public administrators are accountable to legislators to explain the programs implemented, to review by superiors in the executive branch to justify program actions, and faced with the possibility of being checked by a decision of a court. The complexity of the relationship between public administration and law is found in this multifaceted environment. With public action created by so many political and administrative actors of such varying responsibilities using so many different decision-making methods, how can the public administrator help but feel the stresses and strains of public action?

## Law as the Basis of Public Administrator's Actions

State and federal governments are created by their constitutions, which grant broad powers to government. A state's constitution sets the requirements for the political activity of the state. For instance, citizens of Wisconsin have different rights protected by the Wisconsin Constitution than citizens of Georgia, whose rights are protected by the Georgia Constitution. However, neither state (or any state) may use its constitution or statutes to limit rights established by the United States Constitution. In the United States, constitutions contain three branches of government – legislative, executive, and judicial. Each branch has different constitutionally derived responsibilities, decision-making processes, and ways to fulfill those responsibilities. While it is not possible here to provide a primer on systems within each different branch of government, it is important to understand these systems as they form the bases of complexity. To understand how laws and rules are made that form the basis of administrative action while at the same time lay the groundwork for judgments of accountability on the implementation of those same laws, we must have a basic understanding of how those bodies act.

## The Legislature

Legislatures craft laws. While the legislature alone cannot cause a law to come into existence by passing it, the vast majority of public policies and the resulting programs are begun through legislative processes. The many steps proposed legislation must go through ensures that the decision-making structure of the legislature – majority rule – serves the purpose of fulfilling the constitutional role given to the legislative branch of providing representation for individuals who aren't directly involved in government. For a policy to move to the executive to be signed or vetoed, the proposal must survive review at multiple levels within each house of the legislature. This review is both substantive and procedural. A bill begins in language proposed by multiple parties; public policy ideas can be advanced by any element of society. Once there is agreement that a public policy is needed and that the proposed legislation is the appropriate way for that policy to be created, the bill begins its journey

through the legislative process. That journey is marked by substantive analysis– work done by subcommittees that specialize in the topic of the public policy under consideration – and procedural steps. Procedural steps include advancing a bill from committees that assess the appropriateness of the proposed bill to steps created within each house to allow for control of the rate at which policy is brought to the attention of the entire house. It is easy to recall instances where one or two members of a legislative body are successful in delaying or preventing policy from being considered. Those instances, though notable, are not common of procedural checks on proposed legislation. Instead, the most common check on legislative policy proposals comes from the substantive review each public policy proposal must survive. After the procedural process has begun, every proposed piece of legislation is reviewed by at least one committee in both houses of the legislature. Due to the sheer amount of legislation proposed every session, proposed bills are assigned to subcommittees. Once in a subcommittee, the bill must withstand the pressures of political partisanship through the rigorous review of the necessity of the policy contained within the bill. Bills that don't make it "die in committee." After a bill is voted out of the subcommittee and then the committee, it may be brought to a vote before the entire house. Before a vote, the leadership of the house must agree to let that vote happen. If a bill is considered by the entire house, it goes through another round of partisan debate. The purpose of all of this debate is to ensure that the policy created is in the best interests of the people affected by it. Majority rule works to ensure that the legislation has been fully considered and modified so that more than half of the legislative body thinks that the policy will be good for the people most affected by the bill. If a bill clears each house of the legislature, it must be reconciled so that both houses can pass a single version of the bill. This is both a substantive step and a procedural step that must be completed before a bill is brought to the executive for signature or veto.

## Legislative Action as the Basis of Administrative Power

The visible output of the legislative process is statutory law. Within these laws we expect to find directives about how the laws should be implemented and information about how desired outcomes might be achieved. Instead, we find that legislation is the beginning of a process. Administration of statutory law does not often have a straightforward path to implementation of a program. Instead, "[f]ollowing on the heels of the legislation are a series of administrative actions – regulations, guidelines, budget decisions, reorganizations, and so on" (Elmore 1980, p. 9) that must ultimately be considered part of the legislative process. While the legislature passes laws that have policies and programs, administration gives those laws life. And in the process of doing so, administration becomes part of the legislative process. Without the law there is no power for public administrators to accomplish programs. Without administration any program created will remain on the page of statute. This, then, is one face of the interaction between administration and statutory law: *In the case of programs created through legislation, the absence of action by either party will result in a weaker or non-existent outcome*.

The process of implementing programs created through legislation is sequential but not separate. Indeed, while Elmore focuses his analysis on the legislative/administrative relationship, he introduces a site of intersection between administration and law, that of the relationships between the executive branch powers and administration. The process of "doing" public policy is delegated to public administrators who are given the power to use discretion in implementing the policy. This discretion may amount to handing over some policy making power. Michael Lipsky (1980) describes the use of discretion by street-level bureaucrats. Lipsky notes that the street-level bureaucrat is the ultimate policymaker – policy is made when it is used and not when it is created. This is the logical extension of the role of the first instance of interaction noted above. However, the use of discretion can easily lead to allegations of misuse of the power granted by the original

legislation. Legislatures use oversight to assess whether allegations are true.

## Legislative Accountability Checks

Administration is necessary to bring legislatively enacted public policy to life. In every program created within each piece of legislation, a number of parties have tried to exercise influence. The strains of those efforts may be seen in the programs created to ensure that the policy is accomplished. It is the job of the public administrator to ensure that the policy and the program created by the legislature are carried out as required by the legislation. It is important to watch for points where strains created within the substantive and procedural processes of legislating result in programs that may not function well. Not understanding how the policy and resulting programs relate to legislation will lead to future issues with implementation and with oversight. Oversight by legislatures is most often done through hearings run by the subcommittees and committees that were responsible for creating the policy. Individuals on these committees are experts in the law as it was created and so expect to find that public administrative actions have been consistent with the law as each individual understood it. The accountability structure reflects the majoritarian decision-making process: public administrators are held to the policy ideals created by the legislation but may also be questioned about the administration of the policy from a partisan position. Again, it is the job of the public administrator to ensure that the policy and the program created by the legislature are carried out as required by the legislation.

At this point the muddling of the legislative oversight process should be apparent. Legislators create programs through majority-driven politics that contain partisan pressures. Administrators are given the program to implement, which requires a process that might include steps like rulemaking and organizational adjustments. The program, once formatted to fit within the overarching administrative structure, is given to street-level bureaucrats to administer, using some greater or lesser degree of discretion to carry out the program. Ultimately, the legislature checks the ways in which the program is administered, most likely relying on information given to it by the street-level bureaucrats and their supervisors. There is a large area of intersection between administration and legislation. While each element remains separate at times, each plays a crucial part in making sure that programs are delivered to recipients. The intersection is really an interaction – public administrators do not really become legislators, even when given discretion that is used by a street-level bureaucrat, and legislators don't become administrators, even when using data to engage in oversight.

## The Executive Branch

The executive branch houses a much more complex relationship with administration. This fact is glossed over because we think of the executive branch as "the administrative arm" of government. In fact, is much more than a set of bureaucracies. It is a political branch in the constitution and has responsibilities that go well beyond the administration of programs. The model of decision-making in the executive branch is dominated by responsiveness to a single actor – it is a unified structure by which the laws of the government are executed and is therefore managerial in nature. Questions of efficiency, effectiveness, equity, and responsiveness are hallmarks of this type of decision-making. In fact, its decision-making processes are far more varied than the managerial approach suggests. In this setting one complexity of administration and law is separating the processes and offices of administration from the legal responsibilities of the executive branch. Three aspects of activity in the executive branch that illustrate different decision-making methods that serve to highlight points how administration interacts with the executive include *straightforward managerial/bureaucratic practices*, *political involvement in shaping decisions and carrying them out*, and *quasi-judicial models run by bureaucrats*.

The managerial processes of the executive branch are guided by a multitude of public administrative theories and practices. For instance, we follow the dictates of public service that mean we act efficiently and effectively while maintaining equitable treatment of all individuals receiving services that is responsive to the law created through legislative and executive policies. Administration in a system that is driven by rules that shape the determinations of program status is the system of administration we know best. Activity guided by traditional public administration theory continues to develop today. Public administrators are charged with maintaining their own neutral standing within the political environment while acting through a market model of economically driven actions to incorporate all of management theories that exist and then innovating to push those management theories further (Denhardt and Denhardt 2000). This is the place, though, where the work Elmore (1980) describes is done. This is where budgets are drafted, organizations are created and disbanded, and rules are made.

Yackee and Yackee (2012) describe rulemaking as an administrative process that begins as implementing legislation and ends as a clear expression of administration's assumption of lawmaking power. These authors note that rulemaking begins when administrators are "[t]asked with 'filling up the details' and 'gaps' in legislation," and in the end "agencies routinely propose and promulgate regulations (or, synonymously, 'rules') that are as legally binding on regulated persons and entities as are the laws passed by Congress and signed by the President" (Yackee and Yackee, p. 1416). Rules may be required by legislation or by procedures already in place. The process of issuing a rule is governed by the Administrative Procedure Act (2006), either at the federal or state level. It is a lengthy process, going from giving public notice of a proposed rulemaking activity, to the publication of the proposed rule, to the publication of the final rule. The process is systematic and detail oriented, although modern exceptions to the rulemaking process set out in the Administrative Procedure Act have shortened the process requirements (Yackee and Yackee 2012). When a final rule is issued, all individuals and organizations that are covered by the subject matter of the rule must abide by it. There are three ways rules may be challenged. The first of these is in the executive branch. Every leader has created an administrative body charged with the responsibility of limiting the fiscal effects of a rule. If the cost of the proposed rule exceeds that level, the rule will not be created. The current administrative body that assesses and permits or denies the impact of rules at the federal level is the Office of Management and Budget. A legislature may choose to review the rule in an oversight hearing or as part of new legislation and the judiciary may choose to review the rule if someone affected by the rule challenges it in court. Unless one of those three things happens, the rule will remain in force. And the intersection between administration and law will be complete as the administrators have effectively created a specific law through rules promulgated in a specific policy area and have also taken the responsibility to implement that law. Decision-making in the executive branch is not immune from direct political influence. There are two primary sources of that influence: use of the executive order and the inclusion of political appointees in the bureaucracy. Executive orders serve multiple purposes. From directing actions of private contractors that have contracts with the federal government to orders that require that programs supplant elements of the political processes (Emancipation Proclamation, January 1, 1863), executive orders offer the leader in the system the opportunity to formulate policy and then have it implemented without going through the normal legislative process. Another form of political influence in the executive branch comes from the inclusion of political appointees in bureaucratic organizations. These appointments are made to ensure that the president's policy is carried out in the form he decides to enforce. The number of political appointments into the bureaucracy and the extent of those appointments vary by president; the purpose of them remains the same. To ensure that all administrative actions are consistent with the president's policy agenda, individuals loyal to that agenda are embedded within the administrative organization.

The final type of decision-making within the executive branch is where the greatest intersection between administration and law occurs, at times becoming inseparable. Some administrative bodies have the power to hold administrative hearings that are quasi-judicial in nature. The hearing officers are part of the executive branch structure – they are not politically placed, do not have direct ties to the legislature, and are outside the system of courts in the United States. Yet these administrative officers hold the power to alter administrative decisions, directly implement policies created by the legislature, and make determinations of fact that may be binding in a court of law. Administrative hearing officers and administrative law judges exist in many public sector organizations that distribute benefits directly to individuals where the level and type of those benefits are specifically determined by the legislature. One example of this form of administrative action is seen in the determinations made by administrative law judges within the Supplemental Security Income program administrated by the Social Security Administration. The handbook that covers this system, found at https://www.ssa.gov/OP_Home/hallex/, demonstrates the confusing role that administrative law judges play in the process of reviewing eligibility of people seeking benefits. The review system includes assistance from the Social Security Administration personnel in gathering data as well as defending the SSA against determinations of ineligibility made by that same organization. Administrative law judges are bound by the rules of discovery that are applied to courts but also may seek out additional information about the case in a way not permitted by regular courts. Determinations of eligibility and ineligibility might be viewed as creating and applying legislative standards but are instead viewed as a source of correction within the administrative body. The criticism that all three branches of constitutional government are contained in one administrative body seems appropriate, as is the recognition that in the case of administrative hearing bodies there is no true separation between administration and all three branches of constitutional government.

## Executive Action as the Basis of Administration

As is clear from the description just given, the executive structure allows for a wide array of administrative activity. Although rooted in the managerial decision-making structure, this branch incorporates so many possible choices into that decision-making style that it moves beyond simple command and control or even bureaucratic discretionary use of power. The three elements of the executive branch that give rise to complexity are the development of management perspectives over time, the inclusion of political appointees in public sector organizations, and the use of the administrative hearing process. Each of these broadens the base that administrators may rest their decisions on – the breadth of control created by discretion to develop and implement new forms of program administration, work with political appointees to ensure that specific policies are advanced, and react to cases filed in the administrative review system and then react to the rulings of those decisions before the case may be appealed to a court outside the administrative structure. In fact, in the executive branch it is more likely that administration and law overlap rather than interact.

## Executive Branch Accountability Checks

Public administrators are subject to classic command/control oversight. Superiors make assessments of the success and failure of administrative actions based on the standards of efficiency, effectiveness, equity, and responsiveness. The processes of innovation mentioned above come from those assessments. Where the activity of the public administrator in implementing rules and laws is judged to be inadequate, forces may be brought to bear to move administration so that greater success can occur. A second set of constraints can be made by the political appointees embedded in an executive organization. This system of control rests on the ability of political appointees, as supervisors with aspects of policy control, to force changes in line with the forces identified above. There is

simply a different motivation behind the concepts of efficiency, effectiveness, equity, and responsiveness. We expect a political motivation to differ from an administrative motivation simply because the use of an appointee implies political control of administration of policy. The last set of constraints comes from the inclusion of quasi-judicial decision-making in executive organizations. The controls built into that decision-making process are based on an entirely different set of considerations than other forms of control. The mixture of how public administrators must interact with the claimant and administrative hearing officers by providing support to the claimant, represent of the organization's interests, and respond when the result of an administrative hearing is appealed creates a system that closely resembles steps that must be taken when reacting to limitations from all branches of government.

## The Judiciary

The judicial branch is the third branch of constitutional government. Like the legislative and executive branch, courts have a unique way of reaching decisions. Courts use a decision-making process based on legal precedent and statutory interpretation as applied to facts. The use of legal precedent as a basis for decision-making by courts results in a system that is, in almost every instance, incremental (Shapiro 1965). Because the cases brought to courts rely on earlier rulings, any changes the parties can expect are limited by the earlier rulings.

The structure and process of courts are different from the other branches. There are only two forms of courts. These vary based on what kind of information is properly brought to be heard by the judge. The first type of court is a trial court. Trial courts hear information about facts and also apply the relevant law to those facts. Courts at the trial level are the *only* courts that hear the facts of the case. All other courts – courts of appeal – hear only about complaints that the law was applied incorrectly to the facts. This is an important distinction, as the party to the lawsuit that wins at the trial court gets that version of the facts accepted on appeal. There are, however, different types of trial courts in the United States. One set of these are the quasi-judicial (administrative hearing) courts within the executive branch. In most instances, each organization with an administrative hearing body has a process of review within the organization. That review process is parallel to the system of review in regular courts – once the initial facts are found and the relevant law/rules of the organization applied, the question on review is whether the law/rules were correctly applied. Some organizations have additional levels of review while others use only the first level of review. If a person is not satisfied with the results of the review, that person can appeal the case to a regular trial court within the state or federal system. The case is appealed to a federal district or appellate court depending on what the rules of the organization or the original statutory language requires. If moved to a state or federal court outside the review process of the organization, appeal processes are the same as those used in any other case. This is a significant point of interaction between the courts and administration. These practices may be set out in administrative processes and may also be created through legislation. Interestingly, this overlap in roles does not lead to a complex relationship between the administration and the courts. Because the processes are so similar, just taking place in different branches of government, there does not appear to be an issue of interaction. Instead, this seems to be more a replacement. Rather than moving from a completely executive decision-making process, the administrative hearing system mimics the courts, a fact that can be seen in the possibility of transition between the administrative hearing process and a court. The interaction that is complex is the one that occurs in the administrative branch as the review process begins.

The power of the judicial branch is limited. As already demonstrated, in most instances the decision-making structure used by the courts is incremental. While non-incremental decision-making does occur and these cases are not common, these are often the cases that attract most attention and when issued by the United States Supreme Court have the broadest impact.

Decisions made outside the incremental process are derived by principles of government contained within the law. We expect these types of decisions to occur when someone challenges the actual *legitimacy* of legislative or executive action as unconstitutional. The interaction between administration and the courts is found in the decision whether or not to enforcement a court's decision. Administrators do have discretion in the way decisions are enforced (the United States Supreme Court ruling in *Brown v. The Board of Education* had to be revisited because the local authorities failed to implement the Supreme Court's ruling) and the courts have little recourse if an administrator fails to enforce a ruling.

A final interaction between administration and the court is found in the capacity of bringing suit and having suit brought against it. When an administrative organization is authorized by statute to bring cases to force behavior, the courts become another tool available to public administrators to force individuals or organizations to comply with law or rules. This is a novel form of interaction – administration is using the power of another branch of government to complete its own responsibilities. This is different than engaging in prosecutions in criminal settings. Enforcement actions may begin in a trial court or may begin as part of an administrative hearing process. The other side of this relationship is that public organizations may be sued. These suits may be in response to actions taken by the organization against an individual or the case may be brought to force the public organization to act. This is not as complex an interaction. In fact, in this case a third party is engaging in oversight through the judicial branch, which is much more in line with our expectation of how law is brought to bear.

## Judicial Action as the Basis for Public Administration; Judicial Methods of Accountability Checks

The structure of the judicial branch provides a process guided by incremental system of decision-making. The purpose of incremental decision-making within the judicial branch is to ensure that the law as developed by judicial interpretation is created slowly and within a structure that can withstand challenges. Judicial decisions are implemented by the executive branch. Without executive branch involvement, rulings would not be enforced. This, then, is one point of interaction between the courts and administration – if an administrator fails to enforce a judge's ruling, the case could be made that the law hasn't been changed. Public administrators also use the courts to force individual actors to comply with rules or laws. The responsibility of public administrators to execute rulings of courts provides public administrators a different tool to use in implementation.

Judicial actions also provide oversight to ensure accountability of public organizations to the ideals of democratic activity. It is possible for administrative actors to look beyond their own jurisdictions and make judgments about the likelihood of suit based on the rulings of other courts. At times courts will rule against the government, asserting that a legislative or executive branch organization acted outside the powers granted by the relevant constitution. These non-incremental rulings may also be felt into the implementation processes. This is the primary source of oversight given to courts. The effectiveness of this one tool can be seen in the infrequency of its use – it is rare that public administrators have to hear from a court twice.

## Conclusion

The relationship between public administration and law is a complex one, due in part to the number of points at which that relationship is experienced. Each branch of government has its own powers to create public policy; each branch has its responsibilities within the constitution that forms the basis of that government; and each branch has its own decision-making process. Public administrators find themselves at the crux of these attributes when creating, implementing, or modifying public programs. Both the power to act and the constraint on action of the public administrator come from all of these relationships. The complex system of government built to check

inappropriate assumption of political power is visited upon public administrators – complex interaction in application of statutes, executive actions, and judicial rulings is necessary to complete the role of public administrators in process of government today.

## Definition

Complexity has been coped with in many disciplines and has been described in many ways. In organizational terms, it characterizes every situation in which the government body perceives uncertainty due to insufficient knowledge of the observed object or emerging conditions characterizing it.

## Introduction

Proper management of *complexity* has been recognized as a way to facilitate the *governance* of any system (Polese et al. 2014), even if sometimes it has been inappropriately considered the determinant of entrepreneurial failure, thus trivializing decision making that underpin the existential path of the business system.

The exegesis of the term is then of fundamental importance, even though the various approaches to the study of complexity – such as the theory of algorithmic complexity (Solomonoff 1964), the epistemology of complexity (Gell-Mann 1994), the theory of computational complexity (Chaitin 1966), and adaptive complex systems (Barile et al. 2012) – define study and research spaces that cannot be attributed to a unique doctrinal corpus.

## State of Art and Future Perspectives

The literature on business complexity suggests that the notion is articulated and influenced both by multidisciplinary theoretical influences and by the reference paradigm of each author. In this respect, Murray Gell-Mann sustained that no single concept of complexity can appropriately grasp the intuitive notions of what the word should mean (Gell-Mann 1994).

Complexity in the social sphere has been referred by Joseph Tainter (1988) to the following variables: size of society, number and distinction of components, variety of roles and social personalities, variety of social mechanisms to integrate these parts and these roles into an integrated and efficient set. Similarly, Ardigò and Mazzoli (1990) identified: number of elements of social organization, relationships between the elements of social organization, asymmetry between institutions and partial social systems, abstraction and social reflection.

In any case, these are mainly quantitative representations, in which it emerges the structural vision

**Complexity and Governance, Fig. 1** Perspectives to analyze complexity (Adaptation from Barile 2009)

of both the analyzed system and the environment in which it operates. These perspectives do not complete the range of dimensions of the complexity needed to manage system governance.

Moving on from the quantitative approach, there can be reported the three main characteristics of the emergent complexity proposed by Henri Atlan (1972): huge number of differently interconnected parts, impossibility to predict the occurrence. According to his opinion, moreover, the complexity increases in case of negentropic processes.

In business and economics studies, the abovementioned positions can be attributed to specific factors of *governance* and, more in general, to entrepreneurial activity. In this regard, Salvatore Vicari (1998) identified a number of elements that appear to depend on the increase in complexity in business organizations: the facts; the quantity and variability of data that *governance* must consider; the number of elements involved in the problem to solve, diversity, variability, stability, and constancy of problems; other variables that can affect the problem and which are not known by the decision maker; etc. Consistently, Enzo Rullani (2011) merged the structural aspect with a systemic perspective, stating that a problem, a solution, a context, a point of view is complex if it allows for great variety, variability, and indeterminacy of possible situations or events. An acceptable synthesis of the previous positions indicates the existence of three observational perspectives (Fig. 1):

- Internal complexity of the organization versus the complexity of the environment in which it operates (external)
- Complexity in operations versus complexity in decision-making
- A complexity of the organization as it is (quantitative structural perspective) versus the way it behaves (qualitative systemic perspective)

Given the literature analysis, it is plausible to believe that the interpretation of the concept of complexity is characterized by subjectivity (Ng et al. 2012). In other words, the qualification

of a phenomenon as complex derives from the information variety – information units, interpretive schemes, and categorical values – of the observer, whether it is the governing body of a company or an individual. This results in an incentive to investigate the role and influence of relationships and interactions between internal and external components of organization and between external components and the context.

Actually, the progressive emergence of complexity is due to the awareness of the governing body of an organization of its inability or impossibility to coordinate the needs manifested by its suprasystems. In other words, the governing body can realize that the performance of its system does not contribute to stabilizing relations with the context, and perceive a gradual increase in uncertainty. In these cases, it becomes aware of the inadequacy of its interpretative schemes and gives up progressively with rational decision models to selfishly prioritize its own benefits. This behavior results in a growth in the dissonance between the organization and its context, with the consequent worsening in the understanding of the emerging complex phenomena.

There is thus a shift from a condition of certainty in reading events, pressures, and opportunities that qualify the context, to a one of complexity, until a perception of pure chaos. Change in the level of understanding of the context is usually accompanied by a change in the degree of completeness of the system. Because of the self-confidence logic celebrated by its governing body, the organization can perceive a decrease in its interior consonance as well, tending towards a "system in state of completion" or, indeed, an "embryonic" system. This can trigger a growing instability mechanism, which, if not adequately understood by the various systems that live in the context, can further accelerate the spread of distortive behavior.

The interpretative schemes should be shared in order to explore the conditions of existence and, if possible, measure the degree of complexity in business economy, finally deriving observations and reflections without misalignments.

Over the years, the interdisciplinary debate on complexity has involuntarily led most scholars to believe that the complexity of a phenomenon is such, always and in any case, regardless of the observer, the time, and place of observation (Kauffman 1995). However, in business systems, such a hypothesis is impracticable or at least difficult to accept: nothing can be objectively and absolutely complex, since the "same" observer, at different times, perceives different levels of complexity.

Consequently, complexity appears to be a property of the observing system rather than the observed one (Bocchi and Ceruti 2007).

This also implies that the modeling of complexity proposed by an observer can never be considered definitive since it will change depending on the context conditions but also on the changes in knowledge of the observer.

## Conclusions

Generally, both at the theoretical and in the practice level, it is believed that the dichotomy "simple" versus "complex" can be exhaustive for every phenomenon.

However, with regard to systems (but not only), such a distinction appears to be ineffective, especially in organizations, whereby processes related to government – but often also those related to management – although not simple, in many cases cannot be considered complex as well. Then, a distinction is needed in measuring systemic complexity, allowing to share analysis on governance complexity:

- Complexity measured in the structure
- Complexity assessed in the comprehension of systemic processes

The systemic complexity is dense with implications for both governance and management of organizations and for research. From a practical point of view, the proposed perspective provides interpretative guidelines useful for rethinking both the government approach and the management of systems as well as training programs.

From a theoretical point of view, the systemic viable interpretation of complexity opens up a number of reflections that may be of interest to the business economist.

## Definitions

**Self-organization**: Creating order and new patterns in a complex system (organization).

**Networks**: Interactions within different units in a complex system (organization).

**Coevolution**: Transforming phenomena in response to the dynamic forces in a complex system (organization).

**Adaptability**: Adjusting to the unpredictable changes in the business environment.

**Emergent**: Effects and innovations arising from self-organizing, interactive, and adaptive actions in a dynamic business environment.

**Complexity behavior** refers to self-organizing, interactive, adaptive, coevolving, and emergent processes, habits, and actions within a complex system.

**Financial cooperative** is an autonomous association jointly, voluntarily, and democratically

formed, owned, controlled, managed, and used by members with a common socioeconomic and cultural goal to achieve.

## Introduction

In a complex and competitive business ecosystem, market responsiveness, diverse management, and governance approaches are instrumental to achieve sustainable enterprise growth and development. This differs from the traditional command and control approaches of management bounded to inflexible rules and regulations, which inhibit innovation in organizations (McMillan 2008). Anderson (1999) observed that organizations operate in complex, nonlinear, and unpredictable environment. In the developing world, financial cooperatives (FCs) are faced with competitive pressures and witness unpredictable changes in their business operations in the ever-changing business environment. This is partly attributed to the traditional commercial banks and other financial players that have downscaled their operations into the informal financial markets, exerting competitive pressures into the FCs business environment. At the same time, unpredictability is due to the volatile macroeconomic conditions, such as inflationary tendencies in the developing economies.

Financial cooperatives are socioeconomic enterprises, which are jointly formed, owned, and managed by the members to contribute to the set socioeconomic goals. In addition, FCs play a vital role in promoting competitiveness, employment, and wealth creation leading to economic growth and development in developing economies (Omeke et al. 2019). In spite of FCs' positive effect on the socioeconomic transformation of developing economies, they are faced with management and governance challenges in a dynamic business environment.

To this extent, for FCs to remain afloat in a complex and volatile business environment, it is imperative they understand the complex behavior of their members and the environment they operate in because it is nonlinear and unpredictable. FCs operate within complex systems that are composed of many components which may interact with each other to create interdependencies. Complex systems attain complexity through local interactions of agents with local information. Further, the interactions occur through simple rules rather than complicated processes. Since the world is assumed highly rich and novel, the choice of problems is frequently unsolvable, there is no reliable mechanism for agents to achieve desired outcomes individually. Rather, through interactions and cooperation of agents, the system as a whole can achieve desirable outcomes and solve hard computational problems much more efficiently (Bucknall and Hitch 2018). Complexity behavior in a dynamic environment requires management of FCs to understand complex systems whose behavior is intrinsically difficult to model due to the interdependencies, competitions, relationships, or other types of interactions between their parts in a given system and its environment. Systems that are "complex" have distinct properties that arise from these relationships, such as nonlinearity, emergence, spontaneous order, adaptation, and feedback loops, among others to achieve competitiveness.

Extant literature on complexity behavior has focused more on exploring self-organization, networks, adaptability, and emergence concepts independently (Russell and Smorodinskaya 2018; Uhl-Bien and Marion 2009; Uhl-Bien et al. 2007; Goldstein 1999). However, in this discourse, we examine the combined effect of the complexity behavior components in influencing growth and development of FCs in developing countries.

## Components of Complexity Behavior

**Self-organization**: Occurs when financial cooperatives restructure, recombine, and reorganize their operations to meet the ever-changing demands in the market. FCs self-organize themselves by expanding or constraining their operational structures, processes, and strategies, amalgamating them as a way of becoming efficient and effective in their operations. It is the process of self-organizing calls for planning and

coordination through local interactions among the members. For instance, FCs organize themselves by expanding the branch networks, forming task-specific working teams, and partnering with other sister financial institutions in their daily operations as means to readjust their processes and strategies, so as to cut costs, track members' financial behavior, and also become operationally efficient. In the same vein, FCs also restructure their operations internally and externally by adopting technological applications intended to increase on the speed, efficiency, and inclusion of their service delivery. As a result of self-organizing and restructuring, FCs are able to learn and adapt to the changes in the dynamic business environment leading to new innovations and products in their business operations. Consistent with the evidence, self-organization is the spontaneous creation of coherent patterns and order out of local interaction in a natural, physical, and social system (Kauffman 1993). Similarly, Uhl-bien and Marion (2009) observed that self-organization is characterized by changes in structure, processes, and functions through interactions within the organization, allowing adaptation to the changes in the business environment as supported by Anderson (1999). Meanwhile, Goldstein et al. (2010) suggest that organizations coordinate and cooperate due to self-organizing and innovative efforts as expounded on by Mutebi et al. (2020).

**Coevolution**: Eco-evolutionary dynamics is an integration that focuses on how ecological change influences evolutionary change, how evolutionary change influences ecological change, and how those two pathways can sometimes feedback to influence each other (Hendry 2017). FCs do evolve depending on the conditionalities in the global and local financial landscape. The transformation in FCs is evident in adoption of new technological systems, product development, and establishment of networks through linkage banking opportunities. In addition, FCs transform management and governance structures to match international and national regulations set by governments and professional bodies. Coevolution is also witnessed in FCs when there is a change in market forces and dictates by the members for diverse product range that meets their varied needs. Hence, FCs modify and diversify their product range as and when there is demand by the members.

**Adaptability**: FCs operate in a very volatile and unpredictable business environment. Thus, they are expected to do research and respond to the changes in the demand and supply markets. Accordingly, FCs often follow the financial and nonfinancial trends in the market and respond to the changes appropriately. FCs adjust their interest rates, product type, and review their policies over time to meet their members' needs and guard against competitive pressures. Additionally, they also adjust their operational parameters by adopting new technological applications to enhance the speed and efficiency of their operations. This resonates with the view that systems adjust the original order to meet structural changes through learning and adapting attributes in the unpredictable operational environment (Lee 2004; Bourne et al. 2017). Similarly, McMillan (2008) underscores the value of self-organization, learning, and adaptive behavior as vital to respond to changes in the business environment as supported by Gupta and Anand (2015) and Goldstein et al. (2010). Other scholars operationalize adaptability as ability to track changes in dynamic environment as well as flexibility to adjust and modify operations to meet the market demands (Feizabadi et al. 2019; Chan et al. 2009).

**Emergence**: As a result of learning and adapting to the changes in the unpredictable business environment, FCs develop innovations inform of new products, services, and strategies. Therefore, from the self-organizing, adaptive, and interactive efforts, FCs come up with new strategies, products, and services on how to manage and govern the FCs. As a result, diversified products, new working teams, and technologies are likely to be developed and applied in the FCs by enhancing the production and productive levels. Emergent behavior arises from the processes of self-organizing, interaction, and adaptive actions leading to innovative and creative outputs in

organizations (Eppel and Rhodes 2017; McMillan 2008; Holland 1995). Goldstein et al. (2010) further affirms emergence means arising of new, unexpected structures, patterns, or processes in the complex system and emergent phenomena. On the other hand, Sweetman and Conboy (2019) put emphasis on emergent properties emanating from interactive and adaptive actions in organizations.

**Networks**: The interacting components of a complex system form a network, which is a collection of discrete objects and relationships between them, usually depicted as a graph of vertices connected by edges. Networks can describe the relationships between individuals within an organization, between logic gates in a circuit, genes in gene regulatory networks, or between any other set of related entities. Some complex systems, for example, are also complex networks, which have properties, such as, phase transitions and power–law degree distributions that readily lend themselves to chaotic behavior (Mayanja et al. 2019). The fact that the number of edges in a complete graph grows quadratically in the number of vertices sheds additional light on the source of complexity in large networks: as a network grows, the number of relationships between entities quickly dwarfs the number of entities in the network (Berezin et al. 2015). In FCs, networking efforts are manifested by collective and joint operations. Worth noting, the cooperative principles underscore the importance of collective action to achieve common goals targeted by the members. Therefore, members through their management and governance structures often share and exchange information on a daily and periodic basis to contribute ideas and innovations geared towards the common good of the FCs. For instance, in routine operations like member, savings, and capital mobilization, managers and credit officers often organize meetings with the members. Additionally, with the digital processes, they often network and provide feedback with their members on savings, capital, and loan transactions. At the end of the financial year, annual general meetings are held to provide accountability and innovative proposals to the members and also seek for their approval of the planned undertakings. Baltaci and Ali (2017) confirm complex organizations are tied together through interactions and networks among the employees just like FCs. Relatedly, interdependence, linkages, and interaction among agents in organizations manifested by exchange of information leads to generation of new order (Horvat and Filipovic 2017; Uhl-Bien and Marion 2009; Uhl-Bien et al. 2007). Also, complex interactive systems facilities of learning, creativity, and adaptability are attributes in organizations (Marion 2008; Marion and Uhl-Bien 2001).

## Complexity Behavior as a Cooperative Technique

The cooperative movement was founded on the core cooperative principles hinged on the spirit of collectivism, which promote unity and togetherness in the management and governance structures. In that regard, FCs are jointly and democratically formed, owned, and managed by the members (The International Cooperative Alliance 1995). The core cooperative principles tie well with complexity behavior domains of self-organization, coevolution, adaptability, and emergence. Indeed, FCs in a bid to achieve operational efficiency and productivity often reorganize their operational structures, resources, and strategies to respond to the ever-changing needs and demands of their members. FCs form functional teams in the routine activities, such as member mobilization, credit recovery, and savings mobilization working teams. The functional teams enable the members to plan and coordinate their activities appropriately to match the needs and interests of the members. Furthermore, adjustment of the working hours to suit the convenience of their members and introduction of community development sessions during financial literacy programs are self-organizing attributes adopted by FCs. In addition, some FCs have opened and

widened branch networks to increase accessibility to their members. FCs also monitor and adjust their financial prices to fit within the regulatory framework and/or prevailing market conditions. As a result, FCs increase or decrease their interest rates, adopt new technological applications to match the market dedicates to respond to the members' needs, and avoid being outcompeted.

To efficiently and effectively plan and coordinate their operations as an implementation strategy, FCs facilitate a lot of interaction among the members through exchange and sharing of information/ideas using the different mass media platforms like WhatsApp, Facebook, and Internet. These enable the FCs to seek for the different views and ideas from the members to augment effective coordination, development, implementation, and innovations in the FCs.

## Challenges of Managing Complexity Situations in Financial Cooperatives

In practice, financial cooperatives do self-organize, interact, and adjust their operations in response to the changes in the dynamic business environment. However, they are faced with structural and institutional challenges in their routine operations.

First, FCs in developing countries are hindered from effective self-organization, coordination, interaction, and adaptability because of financial and nonfinancial resource constraints. Indeed, the ability of FCs to reorganize, coordinate, and innovate is dependent upon their resource capacity and utilization.

Second, members of FCs are less educated and knowledgeable of financial matters and may not easily adapt to the dynamics of the ever-changing business environment. Additionally, less educated persons are less confident to interact and discover from the more educated stakeholders. Relatedly, the difference in economic power in terms of wealth and resource potentials among the members is a great hindrance to interaction and close working relationship in FCs. The more resourced members often dominate the activities of the FCs, alienating the less resourced members of FCs from the decision-making arena.

The divergence between personal and common goals is a huge stumbling block to self-organization, coordination, and interaction abilities between the members of FCs. Thus, the competing interests of the members also limit their ability to relate, coordinate, and organize activities well in FCs.

Technology use is very important in fostering efficiency and innovation in FCs operations. However, few FCs have been able to acquire and adopt technological systems. In the same vein, use of technological applications to organize, coordinate, and adjust their operations as a means to address the market dictates is a notable difficulty. The macroeconomic uncertainties and disruptions in the developing economies, such as unemployment, inflation, and high taxes adversely affect the ability of FCs to mobilize resources to self-organize and innovate new products and operational strategies.

The financial needs of the FCs members are diverse and complex, products and services are not designed with flexibility to meet the changing needs of the members based on their exposure, experience, knowledge, and market trends. The products tend to be "one size fit it all," irrespective of individual financial needs and strategic growth.

## Recommendations

Adoption of technological applications in the routine operations is paramount in facilitating coordination, interaction, learning, and innovation among the members of FCs. In turn, members should be able to strategically organize themselves and learn from each other to develop innovative strategies of managing FCs.

FCs should set clear goals, objectives, and targets from the onset to promote mutual working relationships among the members, with a focus of collectively achieving the institutional goals rather than individual goals of the members. The clearly operational framework will cultivate interaction, self-organization, and innovation among the members for the common good of FCs.

FCs should invest in capacity building and training of members to achieve competent and knowledgeable working teams. The capacity building of the members enhances their capacity in terms of knowledgeability, skilfulness, and experience in managing FCs, creating an environment for interaction and self-organization to increase on the efficiency and effectiveness of FCs.

FCs with clear processes, policies, procedures, and systems enable coordination, interaction, and learning among the members and other stakeholders. A clear operational business environment will facilitate sharing of ideas and information among the members that foster productivity and innovations in FCs.

FCs should emphasize the ethical considerations and deliberate understanding of the principles and core values of FCs as vital in promoting the cooperative movement spirit of collectivism, which encourages teamwork and interaction through sharing of ideas and information for the smooth and effective operation of FCs. Mutual respect is attained by members following the principles, values, and ethical considerations of FCs.

Additionally, FCs like many organizations, need to focus on execution, and the resultant bias towards efficiency has been the bedrock principle. If the creativity and adaptability required to deal with complexity are to be exercised and even maximized, the FCs need to have the capacity to learn and improvise during their operations. At the individual level, members need a comfort level with ambiguity and willingness to learn. Complexity also calls for shared understanding and actions during implementation of phenomena. Thus, critical group elements underpin FCs' learning capability. Many of these are embedded in the simple process rules of improvisers around listening, supporting one another, being accountable to one another, and to the joint goal. Therefore, clear operational processes, procedures, and systems should be in place to enable complexity behavior to flourish in FCs.

Accountability and transparency in FCs operations foster confidence of the members to interact and seek for information about their joint businesses. Timely and honest feedback to the members enables them to contribute to the development of the FCs by suggesting possible strategies and solutions of running the FCs sustainably.

Understanding the developments and evolutions in the financial markets is paramount to match the competitive pressures. FCs are able to self-organize and adapt to the changes in the business environment based on correct information obtained to develop appropriate products/services of their members.

Finally, FCs should focus on networks that promote linkage and digital banking to reduce on the cost of service delivery and scale up the efficiency levels during operations.

## Conclusion

Overall, self-organizing, interactive, adaptive, and emergent behaviors spur innovations, sustainable growth, and development of FCs. Technological, financial, operational, human resources restructuring, and readjustments are fundamental processes to decipher the complexity science of FCs.

# Compliance Theory of Organizations

Cassandra Dodge
Department of Criminal Justice Science, Illinois State University, Normal, IL, USA

## Synonyms

Remunerative power; Utilitarian power

## Definition

Alienative involvement: An intense, negative involvement orientation of lower participants within an organization (Etzioni and Lehman 1980; Lunenburg 2012).

Calculative involvement: Low intensity involvement orientation of lower participants within an organization. Can be positive or negative in direction (Etzioni and Lehman 1980; Lunenburg 2012).

Coercive power: The use of force and fear by organizational representatives to control lower participants (Etzioni and Lehman 1980; Lunenburg 2012).

Involvement: Spectrum of commitment lower participants have within an organization (Etzioni and Lehman 1980; Lunenburg 2012).

Moral involvement: Intense, positive involvement orientation of lower participants within an organization (Etzioni and Lehman 1980; Lunenburg 2012).

Normative power: The allocation of symbolic or intrinsic rewards and deprivations by

organizational representatives as a means of control lower participants (Hyle 2006; Lunenburg 2012).

Power: The ability of organizational representatives to induce or influence lower participants to carry out directives to behave in a prescribed manner (Etzioni and Lehman 1980).

Remunerative/utilitarian power: The use of extrinsic rewards by organizational representatives to control lower participants (Etzioni and Lehman 1980; Lunenburg 2012).

## Introduction

Organizations differ greatly from naturally occurring groups in that they are designed specifically to address certain goals and are constantly and deliberately redesigned or restructured to meet these goals. Social units, such as families, do change over time, but not in the same methodical way nor with the goal of promoting productivity toward a common goal. It is for this reason that organizations must be approached differently in sociological research (Etzioni 1968).

In the study of organizations, researchers attempt to identify common structures used to solve problems, increase efficiency and organization productivity, and meet stakeholder expectations. The patterns identified are used to develop organizational theories, which serve as the framework for understanding how groups operate. Through research, best practices for optimal function can be identified. However, like all areas of sociological research, there are several theories that have been applied to organizations, to varying degrees of success, which focus on different components of organizational structure and relationships.

Compliance theory was first proposed by sociologist Amitai Etzioni in 1969, though the development of the theory was apparent as early as 1961 (Etzioni 1961, 1968; Etzioni and Lehman 1980). Not to be confused with the legal theory of the same name, compliance theory focuses on the relationship between actors within an organization: the organizational representatives and lower-level participants (Etzioni and Lehman 1980; Hyle 2006; Lunenburg 2012). More specifically, the theory is intended to help examine the relationship dynamics between those who hold power in an organization and those who are subjected to that power. Lower-level participants are subordinates who can have formal or informal roles within the organization. For example, a low-ranking enlistee in the military would be considered a low-level formal participant in a military hierarchy, while a parishioner would be an informal lower-level participant within a church. Individuals are identified as lower-level participants as long as they display a high level of adherence to one of three dimensions of participation: involvement, subordination, and performance (Etzioni and Lehman 1980).

High-level participants are of little concern in compliance theory as it is expected that these actors have a permanent power advantage over those ranked lower. These individuals experience less subordination, have higher expectations for performance, and are likely more committed to the organization and its goals. Gaining compliance from these individuals is not as much of a problem, and the dynamics are less stark. Organizational boundaries, the definitions of who is or is not considered a part of the organization, are determined using the same criteria. Individuals who are identified with at least one of the dimensions of participation are considered to be participants in the organization. If the individual scores low on all three dimensions, such as customers or clients, they are considered to be outsiders and cannot be analyzed utilizing a compliance theory framework (Etzioni and Lehman 1980). The key components of compliance theory are types of power utilized by an organization, the types of involvement of the lower-level participants, and the resulting relationship between the two (Etzioni and Lehman 1980; Hyle 2006; Lunenburg 2012).

## Types of Power

According to Etzioni and Lehman (1980), organizational power differs based of the means

chosen to control participants. Such means may be physical, material, or symbolic in nature. Compliance theory classifies organizational power as coercive, remunerative or utilitarian, and normative. Coercive power utilizes force or the threat of physical sanctions to control lower-level participants. Coercive power structures are common in prison and military settings. In remunerative power (also referred to as utilitarian power) constructs, organizational representatives control lower-level participants through extrinsic rewards. These include salary, commissions, job security, and more. Normative power rests on the allocation of symbolic or intrinsic rewards to exert control over lower-level participants. Some examples of normative power structures include churches, professional associations, and schools (Etzioni and Lehman 1980; Hyle 2006; Lunenburg 2012).

Normative power can be achieved in one of two ways. The first, referred to as pure normative power, calls for organizational representatives to manipulate perceptions of esteem and prestige and utilize ritualistic symbols to achieve compliance. The second, also known as social power, refers to the power peers have over behavior. Both pure normative and social powers are categorized as normative power for organizations due to how they are used by the organization to control participants. Pure normative power can be exercised directly by organizational representatives; however, social power requires representatives to manipulate the informal group in such a way as to ensure the peer group controls its members in a favorable way. For example, a teacher with a misbehaving student can gain compliance through pure normative power by helping the student identify with the goals of the lesson. Alternatively, the teacher could manipulate the class environment in such a way that the student's peers will encourage compliance (Etzioni and Lehman 1980).

## Types of Involvement

While all three types of organizational power are useful in obtaining compliance, their effectiveness largely rests on the involvement of lower-level participants within the organization (Lunenburg and Ornstein 2012). In the context of compliance theory of organizations, involvement occurs on a spectrum of intensity and direction; that is, the involvement can be positive or negative and at a range of intensity. Etzioni and Lehman (1980) categorized involvement as either alienative, calculative, or moral.

Alienative involvement is an intense negative orientation. Lower-level participants are alienated from their respective organizations. Examples of alienative involvement include prison inmates, military enlistees in basic training, or patients in custodial mental institutions. There is animosity, even hostility between the participants and the organization. Calculative involvement is more neutral. Lower-level participants at this point of the spectrum have a low intensity involvement and may perceive their involvement in a positive or negative way. This orientation is common between merchants and regular business contacts. While there is no blatant animosity, there is no indication of loyalty. Moral involvement designates an orientation of high intensity which is positive in direction. Participants of moral involvement are loyal to the organization. Examples include parishioners of a church, or devoted members of a political party (Etzioni and Lehman 1980; Hyle 2006; Lunenburg 2012).

Like normative power, moral involvement can also be categorized into two parts: pure moral involvement and social involvement. The difference between these two is based of the emphasis of the orientation and the direction of the relationship. Pure moral involvement is characterized by the internalization of the norms and identification with authority that occurs in vertical relationships. This is found in relationships between teachers and students, or leaders to followers. Social moral involvement occurs in horizontal relationships within a primary group. Individual participants may be sensitive to the pressures within the group (Etzioni and Lehman 1980).

## Compliance Relationships

The two elements of compliance theory are combined in one of nine possible compliance

relationship types: coercive-alienative, coercive-calculative, coercive-moral, remunerative/utilitarian-alienative, remunerative/utilitarian-calculative, remunerative/utilitarian-moral, normative-alienative, normative-calculative, and normative-moral. Three of these types are more likely to occur than the remaining six types. These three types are also referred to as congruent relationships (Etzioni and Lehman 1980).

Congruent relationships occur when the type of participant involvement is reflective of the type of organizational power utilized. Coercive power, for example, causes alienation while also working as the most effective response to individuals categorized as alienative in involvement (e.g., prison staff to inmate relationship). Etzioni referred this type of congruent relationship as coercive compliance. Similarly, remunerative/utilitarian-calculative relationships (also known as utilitarian compliance) and normative-moral relationships (normative compliance) are the most common and efficient. Organizations experience a significant amount of pressure to become as efficient as possible. Congruent relationships are more effective in achieving organizational goals, so it is unsurprising that these three types are more common (Etzioni and Lehman 1980; Hyle 2006; Lunenburg 2012).

Incongruent relationships, the remaining six, do exist, but are not as successful. The discrepancy between the power and involvement dynamics may result from constraints on either component. Organizations have limited control over the power available to them. A lack of resources or headway to wield power in a way that is appropriate to control participants can deteriorate the organization's stability. For example, external policies may eliminate the ability for an organization to utilize coercive power even though the individuals are characterized as alienative in involvement. Organizations also lack the ability to effect external influences on the individual involvement of lower-level participants. Outside of organizational influences, involvement is also dependent on membership in other groups, values, and personality structures. The combination of these pitfalls can lead to incongruent relationships (Etzioni and Lehman 1980; Hyle 2006).

The major hypothesis underlying contingency theory is "to the degree that the environment of the organization allows, *organizations tend to shift their compliance structure from incongruent to congruent types* and *organizations which have congruent compliance structures tend to resist factors pushing them toward incongruent compliance structures*" (Etzioni and Lehman 1980, p. 93, emphasis in original). This is achieved through either a shift in power applied by the organizational representatives or through a change in individual involvement. Etzioni and Lehman (1980) also suggested that studies on organizational change, conflict, and strain would benefit by focusing on incongruent organizations.

## Power Specialization

The scope of the theory would suggest that every organization utilizes only one type of power, which is obviously untrue. Compliance theorists do acknowledge this issue. They posit that organizations, while using more than one type of power to control lower-level participants, rely on a single type more often than any of the others. This phenomenon, power specialization, is necessary as the use of two types of power over a single group simultaneously will neutralize any controlling effect the powers have. Much like the problems faced by incongruent compliance relationships, when the individual level of involvement does not match with the power utilized, the effectiveness of the action is reduced. For example, the therapeutic treatment of a person with mental illness may have more success when remunerative or normative power is used; however, if this treatment is conducted in a custodial environment, the coercive power used to maintain control reduces the effectiveness of the treatment (Etzioni and Lehman 1980). Similarly, the organizational shift from corporal punishment can be argued for as coercive power negates the functionality of normative power within the classroom (Bulach et al. 2008).

There are a few circumstances in which organizations successfully utilize two power types simultaneously with positive effect. Combat

units were identified as a dual structure that used normative and coercive power (Etzioni 1961). The symbolic rewards, such as prestige, are used in conjunction with the coercive threat of force often utilized in military structures. The result is a highly disciplined, loyal, and proud group of individuals. Unions and churches were also identified as dual structures, remunerative/utilitarian and normative. Both may have direct control over physical and symbolic rewards, gaining increased control over the individual participants as a whole (Etzioni 1961; Etzioni and Lehman 1980).

## Conclusion

In the area of organizational theories, compliance theory specializes in analyzing the relationship and power dynamics within an organization. Outside actors may interact with the organization and its members; however, the low level of adherence to any of the dimensions of participation eliminates them from consideration within the framework of this theory. Similarly, lower-level participants are more important that higher-level participants within the theory's framework as controlling a lower-level participant may be more difficult and the largest differences in levels of compliance are found when studying lower-level participants.

The primary components of compliance theory are the types of power used by organizations and their representatives and the types of involvement for participants. Coercive power is characterized as the use of force or threat of force to maintain control. Remunerative or utilitarian power utilizes extrinsic rewards (such as monetary benefits) to establish control. Normative control employs symbolic and intrinsic rewards to encourage compliance (Etzioni and Lehman 1980; Hyle 2006; Lunenburg 2012). Involvement types are categorized based off of the intensity of the involvement and its direction. Alienative involvement is an intense, negative involvement orientation of lower participants within an organization. On the far opposite side of the spectrum, moral involvement is described as an intense, positive involvement orientation. Calculative involvement is more neutral with a low-intensity involvement orientation in either a positive or negative direction (Etzioni and Lehman 1980; Lunenburg 2012).

The majority of organizations can be categorized into one of three congruent relationship dynamics: coercive compliance (coercive power and alienative involvement), utilitarian compliance (remunerative/utilitarian power and calculative involvement), and normative compliance (normative power and moral involvement) (Etzioni and Lehman 1980; Hyle 2006; Lunenburg 2012). Incongruent relationships are possible, but the underlying hypothesis of contingency theory suggests that either organizations will shift the type of power used, or a change in involvement type will occur to achieve congruency between the power and involvement factors. Additionally, organizations will resist change that threatens the congruency of the compliance relationships (Etzioni and Lehman 1980; Hyle 2006).

## Introduction

Amongst the founding principles of public administration is the idea that administrators are implementers of policy; setting of policy agendas and the construct of legal authority for public programs are the domain of the political sphere. The "good" of public administration has historically resided in notions of administrators comprising a core of expertise within the public sector, engaged in the enhancements of efficiency and effectiveness in achievement of purposes set before it, broadly defined as the public interest. The public interest is variously considered to be a range of ideas from defending basic human rights to more pluralist views to "outcomes best serving the long-run survival and well-being of a social collective construed as a public" (Bozeman, in Lawton et al. 2013, p. 35). In pursuing programs to serve the public interest, administrators concern themselves with stability of public organizations and creation of positive outcomes for client groups (Jordan and Gray 2011).

The development of ethics in public administration employees has settled into two basic schools of thought. The compliance-based approach is informed by the imposition of standards and bright-line canons of what the agency, or unit of government, informed by the cultural context of community outside the agency walls, finds to be good and bad. The capacity-building approach means to grow ethical understanding on an individual level, recognizing that decisions are made of a moral/ethical character at the personal level. This entry first considers ethics in public service generally, to provide context, and then explores each of these alternatives in turn. Contrast and concluding thoughts are then provided.

## Ethics in Public Service

Ethics, "standards of good or bad behavior and action," are sometimes confused with morals or "individual appreciation of the fundamental. . .definitions of good or bad" (Jordan and Gray 2011, p. 6). Ethical issues are "those issues, distinct from political, legal or social, that are concerned with right and wrong actions and outcomes for both individuals and the organizations" for which they work (Lawton et al. 2013, p. 1). Ethics are held to be agreed upon manifestations of prevailing morality; individuals act within or outside of the normed framework of ethical standards. In the public sector, such considerations are manifestations of applied or practical ethics (Pevkur 2007).

The dynamic between public administration and citizens has seldom been settled territory. Given government's wide range of activities, the public may not clearly see the intent and purpose, let alone the results, of such action. Further, the existence of high-profile cases of public corruption, coupled

with a seemingly irredeemable predilection in the mass media to uncover yet more cases of corruption, casting them as assaults of the highest order on the collective public, has led to a culture that believes strongly in the fallibility of its public service, with little or no proof required. This could, on one hand, be portrayed as a passionate view toward ensuring accountability from the public service and a need to increase transparency given serious, ongoing, demonstrated shortcomings on the part of public sector employees. On the other hand, the vast majority of public sector employees are not engaged in nefarious activities; there is therefore no need of a rooting-out of rampant corruption or at least not for that stated purpose.

In the public sector, there is a distinct ethos, an obligation of service weighed against the cold rationality of technical expertise; public administration has prided itself on skillful use of knowledge and a thoughtful human touch. Deontological theory is "concerned with what people do, not with the consequences of their actions"; that is, "Do the right thing; do it because it's the right thing to do; don't do wrong things; avoid them because they are wrong" (BBC 2015). The emphasis is on principles and responsibility (Brady 2003). Utilitarianism as a teleological, consequentialist approach would have it that the greatest good for the greatest number would equate to ethical practice, but harm to a few may prove too great a cost to pay to justify such activity. In utilitarianism, purpose of action holds sway. However, it has been noted time and again that purpose does not outweigh principle regularly or consistently enough for such an outcome to be assumed, particularly in the public sector, although the adoption of a business mindset has often been seen as a cure-all for the afflictions of government. There is a need to hold true to virtue in the public sector, and to think about the difficult questions of how public behaviors may be perceived, even if and especially when it is likely the behavior will be criticized by the public *regardless of* the soundness of its root concept.

The manner of acting within or outside ethical standards only partially explains the concern of ethical judgment in the public sector. Ideally, the citizenry should want its public sector employees to behave and act in a manner that is informed by the social contract. If full moral maturity is not possible, at the principled level suggested in a schema such as Kohlberg's model of moral development, then behavior should at least be based on preservation of conformance with expectations of the public as to acceptable behavior and maintenance of the welfare of the working group within the agency environment. One may think that that "preconventional" behavior, "based upon rules and authority and driven by fear of punishment" (Lawton et al. 2013, p. 15), would be insufficient in a public service model. If public workers are only motivated toward moral behavior by following a rule, to avoid punishment, or for what they may extract from the exchange, then the exchange is not about service to the public but rather service to self.

## Compliance-Based Approaches to Ethics in the Public Sector

Compliance programs have been on the rise since the 1960s. Compliance-based approaches to ethics in public organizations, sometimes called low-road approaches, typically involve adoption of a code of ethics, with attendant training and statement of understanding of and/or commitment to such code. Compliance-based approaches are popular because, as Roberts (2009) noted, they provide a level of protection from the acts of personnel and reduce demand to implement more wide-reaching and expensive programs that seek to enhance integrity. They are low-road approaches because ethics codes are utilitarian: They are easier and cheaper to design and implement than alternative options, including so-called high-roach approaches that focus on developing individual integrity and ethical capacity.

The unveiling of ethics codes can appear as public theater, with reformist-minded public servants thwarting the specter of widespread governmental corruption, whether or not it exists, through proscription of numerous potential excesses. The list of forbidden behaviors is too short to cover all ethical eventualities that may be encountered in the work of the public sphere; even following the list to the letter does little to teach a public official how to think about ethics, why

certain acts are relatively good or bad, and how to make better ethical decisions. Instead of government rooting out the individual actors engaged in corrupt behavior, the whole metaphorical barrel is mistaken and found suspect for its few bad apples. This is especially damaging because "the blunt instrument of law and enforcement frequently strikes the wrong target, leading to unexpected consequences" (Lager 2010, p. 216).

The training conducted for compliance-based programs is sometimes focused on webinars and one-way knowledge transmission methods, to keep costs low. As an example, the Palm Beach County Florida Commission on Ethics has a website (http://www.palmbeachcountyethics.com/training.htm) for all county officials, employees, and advisory board members, which provides training via a training video (https://www.youtube.com/watch?v=Kzx657RRUUs). The video is just over 48 1/2 min long. Visitors to the website are directed to a PDF acknowledgment form to be signed and returned to the administration of the agency responsible for the staff member. The form makes note that the official/employee watched the video on the Internet or on DVD, or attended a live presentation; that the individual understands that he or she is responsible for "understanding and abiding by the…Code of Ethics as [he or she] conduct[s]… assigned duties"; and indicates where the completed form is to be sent.

For its part, the video training is seemingly short, at under an hour, for something as important as public sector ethics and would appear to occur infrequently for each staff member. There is no formal assessment involved in this training and even the presenter indicates how in-person training leads to interaction in addressing specific case examples that does not occur via the online version; this lack of assessment and interaction, coupled with no definitive check on any staff member actually having watched the video before completing the acknowledgement form, makes clear the existence of serious limitations of this sort of compliance-based approach. The training fails to demonstrably achieve the three points in creating effective deterrence against unwanted behaviors: "an individual must know the legal rule, be willing and able to apply that knowledge to a conduct decision, and then determine that the threat of punishment exceeds the benefit of the offence" (Lager 2010, p. 217).

No matter how good the training is, the training itself is incidental to the completion of the form and the acknowledgment of staff responsibility for the code. The *existence* of code is more important than the training or the understanding of the staff member; the completion of the form allows the agency and government to proclaim full compliance with the code, adherence to training standards, and reform of corrupt practices, even if not much has actually been accomplished to improve ethical capacity. Agencies have an interest in arguing that they are compliant and successful, but this may have little to do with actually behaving ethically; lack of training is probably not the reason for unethical behavior, anyway, when cutting corners because of unreasonable deadlines or simple career-related stresses are reasons enough for some employees (Lager 2010).

Compliance-based programs are sometimes criticized for a variety of reasons. Ethics codes often focus upon what employees should not do; the tone of such programs then provides a baseline for behavior that, at least in theory, could result in an employee obeying all aspects of the letter of the code but still behaving unethically. Depending on how the various points in the code are written, certain expected or proscribed behaviors might be extremely vague or so specific as to impose undue constraint. As an example, the American Society for Public Administration includes as the first point of its code of ethics: "Advance the Public Interest. Promote the interests of the public and put service to the public above service to oneself" (ASPA 2013); yet, the interests of the public are seldom ever clear or plainly described, or universally agreed for such a broad pronouncement, and promoting such interests avidly might even include instances where serving the public may include acting in ways that some could conclude as doing some small bad for greater good. This may be acceptable from a utilitarian perspective but fail ethically from a deontological basis. As another example, the Palm Beach County, Florida Code of Ethics has a standard for public gifts of $100, but it could be reasonably offered that the ethical difference between a $101 "inappropriate" gift and

a $50 lawful gift from someone acting to curry inappropriate favor is relatively small – both are wrong, and the lawful $50 gift with intent to curry favor may be even more objectionable. Abiding by the law in such an instance, no matter how well-defined the standard, does not necessarily equate to acting ethically (Palm Beach County 2011).

The problem of ethics codes is made worse by an overreliance on expertise outside the level of the individual public actor within organizations. Relying upon positions such as staff ethicists, compliance-based approaches provide for official interpretations of the ethics code for individual cases. These interpretations over time form a body of understanding that can serve as more of a constraint on individual behavior and practice, given the differences that may exist between cases, than as a source of clarification for the code and expected practice for public officials. Further, these outside experts cannot know and understand the work of all agencies or fully engage in the decision-making approaches and culture distinctive to each organization.

Having examined the compliance approach, we now turn to an examination of ethical capacity building in organizations.

## Ethical Capacity Building in the Public Sector

In contrast to compliance approaches, capacity building in ethics seems to take up more the Socratic question of "how should one live?"; we analyze our behaviors and decision-making because "every act of the human soul involves an act of reason" (Segvic 2009, p. 171). Rather than being concerned about following the letter of rules in detriment to considerations of their ultimate impact upon one's life, career, and service to community, it might be better to be a good person and cultivate virtue in all aspects of one's life. Ethical capacity shifts the focus in organizations from a legalistic, compliance-based standard of ethics to a cultural standard of appropriateness – of right and wrong from top-level leadership through the organization's staff. Ethical capacity building is taking the high road, as Rohr stated: "Relying on moral character, this route counts on ethical managers individually to reflect, decide, and act. Individual responsibility is both a starting and an end point on the integrity route in public service" (Rohr, in Pevkur 2007, p. 17).

In the course of ethical capacity building, training may focus more on the differences that sometimes exist between actions that are merely legal and those that are relatively more or less legal and more or less ethical. This implies the building of an ethical decision-making model, wherein an employee might discern a dilemma and characterize its ethical implications, considering a number of alternative approaches to addressing the issue(s) involved), identifying possible consequences of one's actions given the situation, including the possible behaviors of others and effects of the decision, choosing amongst alternatives, and resolving the issue (Cooper 2012). Employees become more enlightened, and capable in decision-making, and hence more able to perform not only acceptably for the public but admirably.

It is possible that some public decisions may involve a variety of unacceptable outcomes, in which case one might choose the least repulsive. Government must balance deontological issues with cultural issues and the repercussions of employees' actions. The questions encountered in the public sector are not always given to positive outcomes for all concerned, nor do they necessarily leave those making the decisions with positive feelings of accomplishment, especially when some parties are left underserved do to resource issues, legal limitations, or policy parameters. In the public sector, it is important to remember that institutions are made of the people and like people are similarly subject to failure. The decisions made in the public sector may be much different than those made in the private sector; both sectors seek to function according to expectations, but it would not be appropriate for a public sector employee to be primarily concerned with profitability, when accountability or operating within authority granted to agencies is the more appropriate standard.

Even assuming that there is no *absolute* standard of right and wrong, this does not imply that there is no law. The law always provides a

framework, in ethics code or capacity-building environments. Even in the instance of an agency with an ethics code, law would necessarily take priority over internal ethics codes, to the extent that those ethics codes are not themselves made law; even in the instance of ethics-code-as-law, compliance with other levels of law could possibly overtake compliance with a local-level ethics code. As an alternative, the goal of capacity building becomes a model of improving the decision-making model used by employees with a mindfulness toward service obligation, within the law. In this respect, understanding how decisions are made is not a one-time objective in a *perfunctory* training session but an ongoing obligation, so that decision-making processes can be continually enhanced. The point of this approach is to increase the legitimacy of the public enterprise.

The reasons for the lack of popularity of capacity-building approaches are the need to take time and resources to reinforce capacity building, including discussion sessions and additional training well beyond that of the compliance approach; the lack of a clear "best practice" method for capacity building that is easily implementable across all public agencies; and perhaps an unwillingness for public agencies to take up cumbersome topics of ethics and morality, including differences in service level, approaches to various populations, and the like, for fear of possible liability. There is also the need in the public sector to equate time spent and resources used to performance measures, and specifically notions of outcomes (benefit for cost), and the use of time and resources for ethical capacity building may not be as apparent. Capacity building activities, like other training activities in times of economic austerity, may even be seen as wasteful, even though the same accusation could be easily leveled against compliance approaches that deliver little real benefit beyond the appearance of accountability, along with a flurry of activity and associated paperwork.

## Contrasts and Conclusion

For most organizations, the reality of ethical considerations amounts to a continuum between law and values (Pevkur 2007). Even where there are ethics codes, there is no monolithic organizational approach that can indoctrinate all staff members equally to think and behave alike with regard to ethical considerations or any other type of question for that matter. For this reason, codes and compliance-based approaches might be seen more as tools for controlling public dissent, rather than for controlling the behavior of public employees.

Williams called utilitarianism a "minimum commitment morality" (1993, p. 84), and so it is with ethics codes. Institutions focusing solely on observance of ethics codes can pronounce themselves ethical with minimum commitment, showing "the minimum requirements for being in the moral world, a willingness to consider other people's wants as well as one's own" (Williams 1993, p. 84). Training, ethics committees, staff ethicists, and other tropes of organizational compliance-based ethics are at best a stand-in for individually oriented capacity building. At worst, these approaches lull organizations into believing that they have "done enough" as far as ethics are concerned, when ethics should be part of every work day and the subtext of all interactions with the public. Ethics codes rely upon the hypothetical imperative – a weighing of consequential benefits and penalties for public action – and in doing so, fail to serve the greater nature of public service. On the other hand, capacity-building approaches require effort and resources, and many public sector organizations are unable or unwilling to make such efforts or expend such precious reserves in the current, difficult operational environment, toward ends that can be difficult to quantify, in the face of a suspicious public. It can be difficult to put together a workable and effective capacity-building program to encourage and inspire ethical development in employees, and this difficulty may dissuade public agencies that might otherwise attempt such approaches. Combinations of both approaches on the continuum are possible and may provide workable alternatives for public organizations to consider; capacity building in the management corps of an agency may be useful, for example.

The universal nature of right, wrong, and criteria for what is appropriate, for the public's benefit, is too important as a founding concept to charade with a 45 min YouTube video and a signed acknowledgment form. Such activity both undercuts the values-orientation of a service-minded public sector and ignores the motivations of those who would ignore codes and training regardless. The reality of the situation is often that public employees, like people in the community around the organization, are themselves driven by personal values that speak to duty and obligation to service.

# Comprehensive Model of Decision-Making

Renee Prunty
Methodist College, Peoria, IL, USA

## Synonyms

Rational-comprehensive decision-making; Rational-comprehensive model; Rational decision-making model; Rational planning model

## Definition

The costs and benefits of every possible solution to a problem are considered, and the solution with the greatest benefit is selected.

## Introduction

How public administrators make decisions for public agencies is a concept that is much debated. There is a lot of discussion over the decision-makers themselves, but even more about how these decision-makers determine the best or optimal decision. This is particularly important in public administration where the effects of decisions can have a broad array of repercussions for the public. Accordingly, the public will want to know that the public administrators are selecting the best alternative. Often for the public, this means understanding how the agency arrived at the conclusion that the most favorable decision was achieved. They are also likely to analyze whether or not they agree with the decision-making process, so it is important that a clear process is determined and followed. There are several methods of decision-making for public

administration that have been posited with the two most common being incremental decision-making and rational-comprehensive decision-making. The comprehensive decision-making model is often viewed as more of an ideal model, while the incremental decision-making model is viewed as more realistic. There are several variations or combinations of both models that can also be found.

## What Is a Comprehensive Decision-Making Model?

The comprehensive decision-making model advocates for what the term implies, a comprehensive review of all possible solutions when making decisions. The key focus of this model is the use of a cost-benefit analysis to establish the optimum selection, which is why the term rational is often included as part of the name. It is considered by many to be an ideal form of decision-making, because it makes a number of assumptions about the decision-maker and the process of information gathering that if taken literally would appear to be impossible. A comprehensive decision requires a straightforward problem, a full range of possible options, a complete baseline of information, a thorough knowledge of the outcomes of each option, and a comprehensive understanding of the preferences of its citizens. It also requires that the decision-maker has a sufficient amount of time, enough skill, and available resources to complete a comprehensive process (Forester 1984). Given this long list of required information and the resources needed to put it into action, even many advocates of this method believe it is better to view these requirements as ideals to strive toward.

The comprehensive decision-making process is often referred to as the rational-comprehensive decision-making process, because of the emphasis on a cost-benefit analysis of the information gathered. It is very similar to rational choice decision-making. The cost-benefit analysis requires that the strengths and weaknesses of each possible alternative are estimated. Then the possible alternative options are weighed against each other to determine which solution will produce the best outcome with the least amount of cost. It is a balancing of the costs and benefits of each option. The option with the greatest benefit may have too high of a cost, while the alternative with the lowest cost may not produce enough benefits. Therefore, it requires analysis of both to determine which solution produces the greatest benefit with the lowest cost. The cost is often discussed in terms of the efficiency of the solution and the benefits in terms of its ability to maximize the goals that the agency and public would like to see achieved (Svenson 1979). Not only does the comprehensive decision-making model require a detailed cost-benefit analysis of potential solutions, but it requires that the analysis be conducted on all possible solutions.

In order to claim that a decision is comprehensive in determining the cost-benefit of all the possible options, then a number of elements must be met, which requires a large amount of data and information gathering. Before that process can begin, the problem that needs to be solved must be clearly defined and described. This may mean first determining if a problem exists and then if it is one the public wants to be resolved. Often what some view as problematic, others view as acceptable. So, the first obstacle is determining whether or not a problem is viewed to exist. Even when a majority of citizens agree that a problem exists, they are not likely to agree on the nature of the problem, the cause of the problem, or how the problem should be solved. The difficulty of these questions is often the reason public administration is asked to intervene; however, it also makes it difficult to develop a comprehensive decision-making model. The public administrators must do their best to clearly define the problem to be addressed and the goals they hope to achieve. Ideally, the problem will be well defined, unambiguous, and distinct from other problems.

Next assuming the first hurdle is met, the comprehensive decision-making model requires information that is complete and comprehensive. It requires thorough knowledge of possible solutions, potential outcomes, and a baseline of information to make a comprehensive decision. First,

the comprehensive model requires that all possible solutions or goals and objectives are determined. Of course, there could be an endless number of possible solutions and determining everyone could be costly and time consuming. It is more likely that the decision-makers even in the comprehensive decision-making process will determine the most viable solutions to the problem. Second, decision-makers need to determine all of the possible outcomes for each solution. Each of the possible solutions can have multiple possible outcomes depending on different variables. All variations must be taken into account when considering potential outcomes to the solutions. Third, the comprehensive decision-making model requires a complete baseline of information. Like determining all possible solutions and outcomes, it is difficult to create a complete baseline of information. There is always a chance that one factor or another is left out of the baseline of information that has been gathered. In order to run a complete cost and benefit analysis, all of this information is needed to accurately determine the costs and benefits of each option. Every possible factor must be considered in order to ensure an accurate cost-benefit analysis has been completed (Lindblom 1959).

All of this information gathering, as well as the cost-benefit analysis, requires that the decision-makers have a thorough understanding of the preferences of those they are serving. This includes understanding the value preferences of the citizens and what they view to be the most important. A complete cost and benefit analysis cannot be done without a complete understanding of not just the needs, but also the desires of those affected by the decision. The best option is the one that achieves the given goal in the most effective manner based on the values of those being effected by the decision. The decision-makers have to know what individuals are willing to give up to achieve the intended benefits or what they are unwilling to give up no matter what the benefit. Likewise, it is important to know what costs citizens are willing to pay and what costs they view as too steep of a price. Of course there will rarely be a consensus on this, so public administrators must sift through the competing interests to determine the optimum cost-benefit balance that will result in the greatest satisfaction for the largest number of individuals (Eisenhardt 1989).

Finally, besides amassing a comprehensive collection of information, the decision-maker must also overcome a number of obstacles. This method is time consuming, so it requires that the decision-makers have enough time to gather a complete set of information and to provide a comprehensive analysis of it. It also assumes that the decision-makers have the skills and knowledge needed to accurately define the problem, determine the solutions, and analyze the possible outcomes. Each of these steps presents potential problems that could be exacerbated if the decision-maker makes inaccurate assumptions that lead to erroneous conclusions. Lastly, this type of information gathering and analysis will require a significant amount of resources besides time. Gathering information is time consuming, but it also uses up other finite resources of the agency. In the end, the comprehensive decision-making model requires comprehensive knowledge, thorough analysis, as well as a significant amount of time and resources to fulfill its intended goal (Lindblom 1959).

## Difficulties of the Comprehensive Decision-Making

It is often conceded that these are ideals and in the "real world" it is more accurate to describe these as "bounded" conditions because it is not likely that a decision-maker will have all of the information needed but instead will make the most comprehensive decision possible. Instead, the decision-maker is more likely to "make do" with the information available rather than make decisions from optimum information (Forester 1984). If there is a clear, well-defined finite problem distinct from all other possible problems, then comprehensive information gathering may be possible. With a clearly defined isolated problem, it may be possible to define all of the potential solutions and all of the potential outcomes, within the appropriate context and fitting the understood preferences. However, the problems are not always clear.

Critics cite the many difficulties of actually carrying out the comprehensive decision-making model. It seems almost impossible to determine if information is complete, because there is always a potential that there is additional information to be found with just a little more digging. The only way to know that information is complete is to ensure that all possible relevant information has been viewed and analyzed and then collected or discarded. Information, particularly in modern society, appears to be endless, so collecting all possible information could seem to be a never-ending task. Even if it is possible, it would be costly and time consuming to ensure that all possible scenarios were determined and analyzed, including eliminating all nonviable solutions. Finally, not only is the information gathering costly and time consuming, but determining the cost and benefits of each possible alternative can also be costly and time consuming. A cost-benefit analysis is a detailed evaluation that requires rigorous attention to the details. When this must be completed on every possible option, a great amount of time and other resource will be expended. This leads many to favor the incremental decision-making models because it is limited in scope; however, some still highlight the benefits of striving for a comprehensive decision-making model.

## Conclusion

Decision-making is an important part of what public administrators are asked to do. There are several models of decision-making from which administrators may select. The two main models are comprehensive-rational decision-making and incremental decision-making with many variations in between. The comprehensive decision-making model has the benefit of proving to those the public administration serves that the decision was well thought out and the selected option was determined to be the best alternative based on clear data. However, the cost of completing this method may be greater than the agency or those it serves are willing to pay. It is also nearly impossible to know with absolute certainty that the information gathered is complete and without bias, which means that decision-makers will likely make their own determinations about what information will be gathered and what assumptions will be used to analyze the data (Eisenhardt 1989). Therefore, even the best attempt at comprehensive decision-making is not likely to be absolutely comprehensive, but it may not be as restricted or limited as the incremental model.

## Synonyms

Arrangement; Bargain; Compact; Deal; Settlement; Trade-off

## Definition

The *Oxford English Dictionary* defines "compromise" (in the sense relevant here) as "[a] coming to terms, or arrangement of a dispute, by concessions on both sides; partial surrender of one's position, for the sake of coming to terms; the concession or terms offered by either side." In brief, it is an agreement arrived at through mutual concessions (Pennock and Chapman 1979).

Etymologically, the word "compromise" stems from the Latin *compromissum*, which referred to the reciprocal promise of two disputing parties to submit themselves to the judgment of an arbiter, a *compromissarius*. In the Middle Ages, compromise came to refer to the process of electing a *compromissarius* as community representative. Since then, these associations with arbitration and election have gradually disappeared, and compromise has come to refer simply to a particular kind of agreement between disputants themselves.

## Conceptualization

One way to conceptualize compromise (in the current meaning) is to take it as the overlap between four other concepts, namely, conflict, concession, consensus, and consent. Together, they are part of a semantic field with two dimensions: conflict-consensus as an inter-actor dimension and concession-consent as an intra-actor dimension. At the intersection of these dimensions, one finds compromise; it has something of all four concepts while still differing from each of them.

To begin, every compromise implies conflict. Some think this can be a conflict within one person who has to compromise on his own convictions (sometimes called an "internal compromise"), but the typical case is a conflict between two or more actors. They settle their conflict, or rather suspend it, through an agreement they can all live with. Once the compromise has been reached, the initial conflict usually lingers on and its reemergence remains thinkable. Should the actors wear each other out in an exhaustive battle, balancing forces without coming to an agreement, they arrive at a stalemate, not a compromise.

On the other side of the dimension, secondly, compromise differs from, but also overlaps with, consensus. In every compromise, actors agree on at least some points, for instance, on the very fact that they are having the conflict, the terms of their conflict, the desirability to suspend the conflict, the preferability of peaceful settlement over violence, and of course the contents of the compromise itself. Indeed, according to many compromise theorists (though not all), the actors involved have to recognize, at least temporarily and to some extent, each other's legitimacy. (As long as Hamas and Israel do not grant each other a "right to exist," they might make deals, but not genuine compromises.) Compromise, it is believed, requires a certain degree of mutual respect and recognition or at least a willingness to tolerate the other side. Still there is, as said, a continuing conflict as well; a compromise never amounts to a complete consensus. Should the actors manage to agree on an arrangement they consider better than their initial positions, they have arrived at a synthesis, not at a compromise.

Thirdly, for the actors involved, compromise implies concessions. In order to reach an agreement, they give in on their initially preferred positions and accept a suboptimal (second-best or *n*th-best) arrangement instead, leaving them with moral regret. Still, they can accept such an arrangement for a variety of reasons, even for reasons unrelated to the issue at hand, but typically they regard the arrangement better than other ones they consider attainable *and* as better than continuing the conflict without the compromise. The concessions made in compromise are supposed to be mutual; every actor involved has to give in at least to a degree that is acceptable to the other actors. Should an actor be coerced or deceived to make more concessions than he is actually willing to consent to, one speaks of exploitation and treachery, not of compromise. And should, in an extreme case, one actor willingly and unilaterally abandon his initially preferred position and make all the concessions, there will be a capitulation, but again not a compromise.

Finally, compromise needs at least some measure of consent. A compromise, most theorists agree, requires more than a merely mental act of

acceptance – of the often grudging submission to the inevitable. It requires consent – the voluntary, unenforced, and honest willingness (however partial and conditional it in these respects may be), to agree with the arrangement. This consent may be explicit, but also tacit, and outside the negotiation room the actors may deny their consent vigorously. Given the fact that concessions have to be made, the consent can never be wholehearted, but some measure of genuine consent is necessary because it creates moral obligations to heed the agreement on the side of the other parties. As philosophers say, mutual consent makes compromises "morally transformative": it changes the moral status of actors toward one another.

## Types and Reasons

Many compromises are about material interests or what are sometimes derogatively called "bread-and-butter issues." These can be complicated and sensitive, but often they allow for somehow "splitting the difference" between parties. Such non-moral compromises are also often called deals or bargains and have been the subject of extensive scrutiny by economists and game theorists. More controversial are so-called moral compromises: compromises that involve conflicts on moral issues and hence often also concessions on moral principles. These tend to be particularly hard to strike and are often highly controversial. Many different writers, such as libertarian Ayn Rand and President John F. Kennedy, have even stated that while compromises on interests are often needed and good, compromises on moral principles should never be made. Others, however, have rejected this distinction and defended the necessity of making political compromises on principles, as well. In the literature on the ethics of compromise, abortion is often mentioned as a moral issue on which compromises are particularly difficult to achieve.

A seemingly similar but actually different distinction is that between pragmatic and principled compromises. This distinction concerns the *reasons* for which one compromises. A pragmatic compromise is struck in order to achieve other goals; it is seen as a mere instrument and often as a necessary evil. In case of a principled compromise, by contrast, one has distinctive moral reasons to compromise (for instance, the felt need to respect one's opponents' dignity). Striking the compromise is then considered morally desirable, even if there would otherwise be no need for it (for instance, because one has won an absolute majority). Opinions differ, however, on the question whether principled compromises really exist, especially in politics, or whether all compromises are necessarily pragmatic and therefore, in part at least, "strategic." This debate has only recently been opened and is far from finished.

Besides these two sets of reasons for compromising – pragmatic and principled – a third set has occasionally been suggested, namely, *epistemic* reasons. The moral dilemmas and controversies that underlie many of our social issues and policy debates are simply too complex, it is argued, to be resolved by one individual actor. Unintended consequences and unforeseen negative side effects will always be possible. A more prudent approach then would be to involve more actors than is strictly necessary and to opt not for one clear-cut course of action but instead for a compromise. This would do more justice, it is thought, to the complexity of the issue at hand. When the actors involved recognize this possibility, recognize their own cognitive and imaginative limits, and recognize each other as "epistemic peers" (three recognitions that may not come about easily), they have strong epistemic reasons to compromise.

## Ethics of Compromise

The subject of compromise touches upon many core issues in the field of (applied) ethics, including conflict resolution, integrity, and self-identification. It is also an important topic when it comes to the relationship between professional responsibility and personal morality. A useful distinction has been made between the morality *of* compromise (concerning the question whether and when we should compromise in the first place) and the morality *in* compromise (concerning the question how and under which constraints we should compromise once we have decided to do so). That these

two issues bear upon each other seems obvious, but few ideas exist on how exactly they are related. It seems safe to say, at any rate, that the degree to which a compromise can be made in a proper way (morality *in* compromise) determines in large part the degree to which it should be made at all (morality *of* compromise). Assessing the former before entering the process may, however, prove an impossible feat.

In relation to the morality *of* compromise, authors have noted the so-called paradox of compromise, which states that to hold a moral value dear implies that one wants to achieve it, but to achieve it one often has to compromise on that very value. In other words, a compromise will let you have more than you would have had without it and less than you aimed for. Not all actors might see things in this way, however. Uncompromising actors might deny that a compromise on their fundamental principles would give them any gains at all. For them, to join in a compromise means to be "compromised" or even to be stained with moral guilt. Here the aesthetics of compromise easily takes over from the ethics of compromise. People may speak of bad compromises as ugly, rotten, and stinking. Others, however, have praised the creativity and beauty of good compromises.

As these diverging valuations show, compromises almost by definition arouse a sense of moral ambivalence, albeit not in the same measure for everyone. From the viewpoint of a consequentialist ethic such as utilitarianism, compromises do not pose particularly difficult questions. They naturally fit with the principle that our moral choices should maximize overall utility. Compromises are often just necessary if one wants to promote "the greatest happiness of the greatest number." The consequentialist appreciation of particular compromises can be very "principled" and morally considerate, not less so at least than many high-minded rejections of them.

The opposite position often stems from a duty-oriented ethic such as deontology: it espouses absolute principles on which one should not compromise at all. Immanuel Kant's famous condemnation of lying, for instance, does not allow for compromises. Often, however, deontological reasoning is not used to denounce compromises categorically, but rather to set some strict limits around them. In international relations, for example, compromises, even bad and not fully just ones, must often be struck for the sake of peace, but perhaps even in that sphere, some compromises should never be made, not even to avoid war. For instance, Margalit (2010) has famously argued that compromises which support systematically cruel political regimes that break the bonds of our common humanity are "rotten" compromises and should be rejected. Others have argued that compromises are only morally acceptable if they improve on the status quo, if they do not violate basic human rights, if they do not trespass God's commandments, and so on. Needless to say, none of these deontological conditions for legitimate compromise making is generally accepted.

Virtue ethics, the third major approach in ethical theory, tends to be least outspoken about and most ambivalent toward compromises. Its comparative silence on the subject has to do with the fact that virtue ethics, contrary to the other two, primarily aims not at the moral quality of single actions but of human persons as a whole and the lives they live. Its ambivalence stems from the fact that compromises seem at odds with some virtues (steadfastness, courage), but required by others (prudence, charity, peacefulness). Despite this ambivalence, it seems clear that the exercise of virtues does affect the moral acceptability and quality of compromises. A bravely, patiently, and sincerely made compromise will, other things equal, tend to be better than a cowardly, rashly, and deceptively made one. In other words, while consequentialism and deontology have much to say about the morality *of* compromise, virtue ethics seems more helpful for assessing the morality *in* compromise.

One notion with a distinctly virtue-ethical flavor that is frequently juxtaposed to compromise is integrity (Benjamin 1990). In present-day political and administrative ethics, integrity is of course a very central concept, but much of the "integrity management" literature deals with forms of inappropriate behavior (bribery, conflicts of interest, harassment) rather than with morally ambivalent decisions such as compromises. In the literature on compromises,

however, the question is raised whether actors can compromise on moral principles without harming their own moral integrity. And this question is often answered positively: many authors argue that compromising can be a sign of moral strength rather than moral weakness and that, in fact, an unwillingness to compromise shows a lack of integrity.

## Compromises in Governance

"All government (. . .) is founded upon compromise and barter," Edmund Burke famously said in his *Speech on Conciliation with America* (1775). Politics, indeed, has often been called "the art of compromise." In public governance, be it in diplomacy, labor relations, or policy making more generally, compromises are omnipresent. The public sphere is, after all, the place in which various moral perspectives and material interests come together and where choices often cannot be postponed until a perfect solution is found. Indeed, even the long-lasting constitutional arrangements within which politics and administration take place can be understood as compromises between conflicting interests and various "regime values."

If compromise is essential to governance, this seems particularly true for democratic governance (Dobel 1990). Arguably, a willingness to compromise is particularly fitting for politicians and other policy makers in democracies, because there the negotiating actors are equal by principle and must rely on persuasion rather than force in the process of decision-making. Tyrants often make concessions, too, but they do not have to agree on compromises with opposing parties, and the opposition does not have to consent to their rule. The fact that modern democracies are characterized by moral, ethnic, and religious pluralism is an additional reason to emphasize the need for political compromises. Particularly under the condition of multiculturalism, compromise making is regarded a proper political instrument, and it is often associated with tolerance and a liberal moral and political stance. These associations are not intrinsic to the concept of compromise (non-liberal and even intolerant political actors can compromise, too), but they are very strong nonetheless.

Not only in politics but also in public administration compromise is of course a highly common phenomenon. If administrative arrangements can be divided, as is often done, into hierarchies, markets, and networks, compromises seem most suited to the last. Weberian bureaucracies with their strict hierarchy and regulatory discipline do not easily allow for compromises. New Public Management (NPM) style contract-based governing and public agencies do clearly depend on deals and bargains, but the notion of moral compromise spelled out here seems more alien to them. In governance networks, however, compromises seem particularly at home. When there is no clear center of authority, no hard and fast regulations, nor (quasi-) market mechanisms, actors will have to manage public problems with a flexible and cooperative attitude. Compromise is thus one of the most natural ways to deal with competing interests and values in contemporary governance.

## Compromise and Political Theory

Since about 2010, there is a strong renewed interest in the topic of compromise in (Anglo-American) political theory. This seems to have two reasons, one theoretical and one practical. Theoretically, compromise is found interesting because it promises a middle course between two competing approaches: liberalism and realism. Ever since John Rawls' book *A Theory of Justice* (1971), the field of political theory has been dominated by political liberalism. In all its variety, this approach has emphasized the need for a consensus (in Rawls' terms, an "overlapping consensus") among people with different moral and political views. This consensus should be found in a set of (liberal) principles to which all reasonable people could voluntarily agree. The core value on which these principles should be based and which they aim to promote is justice. In recent years, this very project has been criticized by theorists who reject

liberalism and favor realism instead. They believe the aimed-for overlapping consensus can never be found because politics is inherently conflictual. The best we can achieve, they argue, is modus vivendi arrangements that, like no-fly zones above war-torn areas, mitigate the intensity of ongoing conflicts. Peace is probably never really attainable, but should still be the core value driving our search for such arrangements.

Now compromise is seen as a concept that can lessen the tension between these two approaches. For compromise combines, as we have seen, elements of both consensus and conflict. It is often more than a merely pragmatic bargain (modus vivendi arrangements), but still less than a comprehensive agreement (consensus). Hence, some theorists believe that the notion of compromise is well suited to bridge this division between liberalism and realism. But as can be expected, others remain skeptical about this possibility.

## Compromise in Current Conditions

The more practical reason for the recent surge of interest in political compromises among academics has to do with the changing nature of present-day democratic politics. Admittedly, the appreciation for compromises has always varied among cultures and across time. For example, while compromise making has traditionally been valued by the Brits, it was despised by the French. And while for decades the willingness to compromise was associated with the conservative right, with the political left being inclined to reject compromise making as insufficiently radical, this seems to be largely reversed nowadays. So the appreciation of compromises has always been varying and changing. Today, however, several observers express strong concerns about a near-universal rejection of compromises among both the masses and the governance elites in Western democracies. In a culture of polarization and populist anti-elite sentiment, compromises have become unpopular with citizens and the media and hence also with politicians themselves. Particularly in the United States, but also in other countries, politics is increasingly dominated by the constant struggle between two political blocs engaged in "permanent campaigning" and hence finds itself regularly in deadlock. Important and urgent issues, such as the national debt and immigration, can therefore not be adequately tackled. The uncompromising mindset of many politicians, reflecting an uncooperative "winner takes all" mentality, is a serious cause of concern (Gutmann and Thompson 2012).

# Concept and Experience of Decentralization in Latin America

M. Camilo Vial Cossani
Instituto Chileno de Estudios Municipales, Universidad Autónoma de Chile, Santiago, Chile

## Definition

Current consensus around the concept of decentralization tends toward the positions taken by Falleti (2005) or Rodden (2004). These scholars define decentralization as a public policy process whose overall effect is to transfer responsibilities, resources, or authorities from central government toward subnational governments, which enjoy autonomy.

## Introduction

The concept of decentralization has been an object of interest and study for a range of disciplines since the middle of the twentieth century. Decentralization came to the attention of economists, for example, in relation to the problem of efficiency in allocation of public services. Political scientists, on the other hand, were interested in communities' need to come together to pursue common objectives and interests, forming limited alliances around these while seeking forms of state organizational design that respect the heterogeneity of their members.

In Latin America decentralization, in the form of administrative political reform, became a central preoccupation of both neoliberals and social democrats during the 1980s. The former sought modes of doing politics that offered a smaller, more efficient central state. The latter, operating in the era of post-authoritarian restoration of democracy, saw in decentralization the promise of a solution that would broaden the field of rights and freedoms, integrate politically excluded sectors, and strengthen mechanisms of citizen control and participation.

Three decades on, we might ask whether decentralization in the region has proved capable of satisfying these wide-ranging expectations. Empirical evidence exists that is generally interpreted as supporting the hypothesis that fiscal decentralization contributes positively to the well-being of the population. Nonetheless, a series of studies counsels caution before subscribing to this conclusion. This chapter therefore aims to (1) review conceptual approaches to decentralization from the perspectives of politics, economics, and political-administrative reform and (2) sketch out the drivers that led to the adoption of decentralizing reforms in Latin America and chronicle the main experiences and outcomes associated with these reforms.

## Decentralization from a Political Perspective

"Before the nation state became the focus of democratic ideas, political theory held that the city-state was the most appropriate unit of republican and democratic government" (Mardones 2008, p. 44, author's translation). In this era, the belief was that the smaller the number of citizens, the more influence each could have over the decision-making process.

Notwithstanding this early championing of the democratic virtues of small political-administrative units, significant political and scholarly contributions on the subject of decentralization did not begin to appear until 1835, with the publication of French scholar Alexis de Tocqueville's *De la démocratie en Amérique*. The work, product of almost a year traveling through New England, introduced the notion that democracy was particularly well served by decentralized modes of organization. On his travels, de Tocqueville observed how a good proportion of everyday matters were resolved at district level, with no need to involve county or central state authorities, who were accordingly freed up to attend to legislative and strategic matters of regional or national import.

For de Tocqueville (2002), sovereignty, in democratic systems, inheres in the people. Each

person is invested with this sovereignty and is therefore capable of self-government. Individuals must nonetheless obey society, not because they are hierarchically inferior to it but because of the utility that is obtained from submitting to a regulatory power. The most natural form of organization of such power would be at the district (neighborhood) level, where each individual can participate directly. Decisions can be taken on a majoritarian basis, and authorities can be directly elected. In de Tocqueville's view, this is the kind of setting in which each person can meaningfully exercise their right to self-government.

Despite this early discussion of decentralization, theoretical and empirical attention to the phenomenon did not really take off until the 1950s. At that time, as will be seen below, the interest came principally from economics. Two decades later, William Riker (1975) however applied a political optic to develop the concept of federalism. He defined this as a decentralized organizational design for the state, in which tasks are divided between federal (central) and constitutive (local and regional) governments. Each has specific competencies, over which they enjoy final power of decision. Robert Dahl (1986) added that for true federalism to exist, certain of these competencies should be the exclusive prerogative of local and regional government, placed beyond the reach of federal authorities. Similarly, other issues would be the preserve of the federal state to the exclusion of subnational authorities.

Daniel Elazar (1987) argues that federalism proceeds from communities' need to form associations in furtherance of shared interests and common objectives. This generates limited alliances, focused on these areas of action and still respectful of the heterogeneous nature of the constituent parts. Elazar reminds us that in a unitary model, decentralization remains in the gift of central government, rather than being built into a founding agreement or the very essence of the alliance. Decentralization in a unitary state therefore creates a hierarchical structure, whereas in a federal state, it instead creates larger and smaller parallel spheres of political decision-making. He adds that structures of federation are created through practice rather than being set or fixed. One can therefore encounter states which are formally unitary or formally federal but exhibit some of the characteristics or behavior of the other type. Similarly, Falleti (2005) adds that the structuring of political organization in any nation is a process of continuous reform. The dichotomy between center and periphery may resolve itself toward one or the other at different times, according to circumstances: this holds for both unitary and federal states.

In sum, decentralization is most commonly evidenced in practice as a regime of political organization that a state generates, whether via an alliance between constituent governments or by the decision of a central government: hence it can be found in both federal and unitary states. It is characterized by a constant process of negotiation between representatives of central power and of subnational power (Mardones 2008).

## Decentralization: An Economic Perspective

Decentralization became a subject of interest to economists mainly in connection with concerns about efficiency in the assignation of public services. Paul Samuelson (1954) showed that state provision of public services is driven by residents' aggregated, rather than individual, preferences. This produces an efficiency problem, particularly when contrasted with the private sector, where the market is indeed capable of providing personalized responses. Charles Tiebout (1956) added that the efficiency problem will be reduced where public services are provided in a decentralized way. Here we see the origins of the notion of "voting with [one's] feet," whereby it is believed that citizens may select their place of residence according to which place best matches their needs and preferences.

In 1972, Wallace Oates published *Fiscal Federalism*, in which he showed that a decentralized model of the state represents multiplicity within unity. This means that unity can be delivered where required but variety and independence can be guaranteed when and where unity is not essential. Oates also argues that one of the

fundamental theoretical problems of fiscal federalism is the articulation of various levels of government for the provision of public services. This arises in part because patterns of demand do not necessarily coincide with the territorial units into which the political-administrative system has been divided. Moreover, the problems are exacerbated by the fact that there is no one single optimal unit size: optimal size varies according to the particular public good or service that is under discussion (Oates 1972). All of this creates positive and negative externalities, which must be compensated for. Nonetheless, even once these imperfections are taken into account, local jurisdictional boundaries should be more efficient than national ones at satisfying local and regional demand.

In this way, fiscal federalism takes the view that a decentralized model of public administration is the most efficient alternative for the provision of public goods and services. Complementing and strengthening this view, public choice theorists such as Dennis Mueller (1979, 1984) used public opinion data to demonstrate that the search for individual self-interest is not sufficient to produce the optimal outcome that classical economics claims (by which the market is assumed to be self-regulating if supply and demand are left to act freely, under the perfect competition conditions specified in Pareto optimality). Mueller calls attention to the fact that the trading of goods is only possible if prior agreements are in place, guaranteeing compliance with regulations and the requisites of a competition framework. Maximization of particular interests alone will, in contrast, produce very high incentives to seek means other than exchange for the acquisition of goods. Thus each person may produce and consume less, as a significant portion of their time and effort will be invested in protecting their goods. From this it follows that public assets require cooperative, rather than competitive, solutions, since the former are more efficient at a societal level. These prior agreements have an associated cost, which is shared across society through taxation.

Campbell et al. (1991) came up with "local public choice," a model of local public opinion in which the apportioning of resources for public goods and services funded from local contributions is carried out by collective decision, within certain budget parameters. Here, political candidates present their proposals or manifestos alongside their proposed taxation regimes, and voters make a decision based on both variables.

Fiscal federalism has also given rise to neoinstitutionalism, whose principal exponent is Douglas North (1990). North claims that a social contract is indispensable if the market is to function adequately. This contract must be both preexistent and compulsory and must spell out the mechanisms by which it is to be enforced. Neoinstitutionalism accordingly focuses on norms and procedures (conceived of as institutions) since these are held to be vital for development and economic growth. Neoinstitutionalism inspired a series of studies on industrial districts and subnational development (such as those of Putnam 1993; or Stöhr 1990).

## Decentralization as Political-Administrative Reform

Rondinelli, Nellis, and Cheema combine political science and traditional economic approaches to the concept of decentralization into a single perspective, defining decentralization as "the transfer of responsibility for planning, management, and resource raising and allocation from the central government and its agencies to: (a) field units of central government ministries or agencies, (b) subordinate units or levels of government, (c) semiautonomous public authorities or corporations, (d) areawide, regional or functional authorities, or (e) nongovernmental private or voluntary organizations" (Rondinelli et al. 1983, p. 13). They also suggest that decentralization can be categorized into four types:

- Deconcentration: the transfer of authority or responsibility from central government to subnational offices
- Delegation: the transfer of responsibility for delivery of functions specifically defined and controlled by central government to entities that are separated from it or whose dependence

on it is indirect (e.g., public companies or state universities)
- Devolution: the creation, or financial or legal strengthening, of subnational units of government characterized by their independence of, and autonomy from, central government, which often enjoys only indirect supervisory powers over them
- Privatization: the transfer of responsibilities to private companies or voluntary organizations, for example, via sale, concession, or putting services out to tender

This traditional definition, in wide currency throughout the 1980s, seems insufficient for studying present-day decentralization processes. First, because it does not differentiate competencies which require local decision-making from those in which subnational governments merely execute decisions taken at the center (Finot 2001). Second, because academic consensus around this definition has declined due to its strong association with state modernization, failing to treat decentralization as an independent phenomenon (Mardones 2008). Third, because in the present day, only the concept of "devolution" bears much resemblance to decentralization per se (Mardones 2008).

Eduardo Palma and Dolores Rufián (1989) draw an important distinction between the concepts of decentralization, delegation, and deconcentration. They depart from Rondinelli, Nellis, and Cheema by no longer treating the latter two as part of the former. Instead, all three are defined as transfers of competencies: in the case of decentralization, toward democratically elected entities that act with autonomy; in the case of delegation, toward decentralized entities that report to the central government responsible for delegating the functions; and, finally, in the case of deconcentration, toward officials who are designated by central government and who do not enjoy autonomy.

In regard to privatization, some observations are necessary. Christian Von Haldenwang (1990) holds that decentralization applies not only to the political arena but also to two key areas of public management: the administrative and the economic. If we accept that the term "decentralization" connotes a transfer of power, in whatever form or of whatever type, then it would seem justified to talk in terms of political, administrative, or economic decentralization (Boisier 2007; Finot 2001). Von Haldenwang would include deregulation as a form of economic decentralization. Boisier (2007) adds that privatization has the potential to constitute itself as a form of decentralization, if and when it allows the introduction of a new actor which takes independent decisions.

However, more generally there has been a move toward definitions that preserve or reassert the centrality of the state in decentralization, as emphasized by, inter alia, Palma and Rufián (1989). From this point on, privatization was discounted as a model of decentralization, since it was argued that those who received the transferred competencies had to be state agencies, whether autonomous or not (Palma and Rufián, op. cit.) While all three actions (decentralization, deconcentration, and delegation) involve the central state externalizing functions and competencies for which it was formerly responsible to other agencies, it maintains control over these whether in regard to the production or the provision of public services. By contrast, privatization connotes the transfer of these functions and competencies to organizations that are completely external to the state. O'Neill (2005) limits the field of "economic" action to the concept of fiscal decentralization, referring to the capacity of subnational governments with democratically elected authorities to make autonomous spending decisions and to levy their own taxes.

Current consensus tends to settle around the positions adopted by Falletti (2005) or Rodden (2004), defining decentralization as public policy processes that, taken as a whole, transfer responsibilities, resources, or authorities from central to autonomous subnational government. This definition highlights three central aspects: decentralization is a process carried out independently of concrete political, administrative, or fiscal situations in which a state may find itself at a specific moment in time; privatizations and deregulation are excluded since in this definition the receiving entity must be a subnational unit of government

and the autonomous character of the receiving entities is emphasized, with a preferential emphasis on subnational citizenries. Falleti (2005) sketches out three subtypes within this definition:

- Political decentralization: a set of constitutional and electoral reforms carried out to open up spaces of subnational political representation, with the objective of conferring political authority, through elections, on subnational actors who are not dependent on central government. This allows the elected representatives to respond to the citizens of their territory, rather than to directives emanating from the center. This should in turn encourage the creation of mechanisms of accountability and various tools for citizen participation.
- Fiscal decentralization: refers to a set of public policies dedicated to creating fiscal autonomy for subnational governments, in terms of both income and public spending. These policies can adopt a range of forms and mechanisms, such as fiscal transfers from central government, the creation of subnational taxation, or the delegation of tax-levying powers to authorities at this level.
- Administrative decentralization: the transfer of the management and administration of national public policies and public services, such as health, education, or housing, to subnational governments. This transfer must bring with it the possibility of developing a process of decision-making at this level about specific public policies (with a certain level of relative autonomy, notwithstanding the need to respect national conditions and standards pertaining to that policy area). It should also confer the power to supervise this development and to finance it.

## Decentralization in Latin America

Recent decades have seen two principal lines of support for decentralization measures in Latin America, emanating from two quite different positions. One group was interested in subnational development and planning, while the other supported neoliberalizing reforms (de Mattos 1990).

Among the first group, decentralization as a political-administrative reform came to prominence in the 1980s, strongly linked to processes of democratic restoration. Decentralization was a solution that broadened the field of rights and freedoms, integrated previously excluded sectors into the political arena, and promised to empower mechanisms of citizen control and participation (Borja 1987). From a sociological perspective, decentralization offered an opportunity to reintroduce civil society into the political debate. It favors certain dynamics that are integral to social life in democratic regimes, such as citizen participation, and the strengthening of civil society and of social movements (Cunill 2009; Delamaza et al. 2004). It was believed that new states emerging from years of authoritarianism ought to adopt modern, democratic, and pluralist designs and that decentralization was the obvious counterpart or expression of these (Mascareño 2008). This accounts for the strong political impetus that lay behind early decentralization processes, since the expectations were that they would improve the allocation of public goods and services, strengthen oversight and accountability mechanisms, and encourage citizen participation (Daughters and Harper 2006). It was also believed that decentralization would open a broader spectrum of local and regional pluralism and representativity (Restrepo 2006).

Argentina and Chile however stand as exceptional cases in the region. Here, decentralization was inspired by neoliberalism. Its main aims were to improve efficiency and efficacy in the use of public resources and in state administration in general (Rojas 1999; de Mattos 1990).

Boisier (2007) meanwhile held that decentralization in Latin America was also a response to the region's insertion in the globalized international scene. He argued that technological and scientific revolutions, in creating new areas of competition, had also permitted the decoupling of production from place. This, added to privatizing tendencies and growing demand for greater space for self-realization, would come together to increase the impetus toward decentralization in the region.

This backdrop of course led to the appearance of a range of characteristics that turned various countries into uniquely interesting objects of study. Why decentralize? Decentralization is not, of course, an end in itself: it is envisaged as a means to achieve other objectives. The first wave of Latin American decentralization, which took place in the 1980s, was invested with the high expectations described above. However, a good proportion of these goals remain unmet, leaving a sense that "decentralisation has not managed to generate the hoped-for processes of social, political, and economic inclusion" (Montecinos 2005, p. 84, author's translation). In addition to this sense of dissatisfaction, the widespread economic crisis that took place in the second half of the 1990s brought about a change of focus, which Gómez Saibani and Jiménez recognize as amounting to a second wave of decentralizing policies: "Co-participation regimes – involving revenue sharing, usually on a free disposal basis – were no longer prioritised, as they had been in previous years. Instead, a preference emerged for the channelling of federal resources to subnational government for health and educational spending. This strengthened the role of mechanisms of earmarked (designated) transfers" (2011, p. 15, author's translation). During this period, Latin American governments abandoned pretensions to subnational equilibrium, at least as a primary goal. Preference was instead given to guaranteeing equality of opportunity for the promotion of local and regional development, in which the deepening of imbalances becomes a logical or expected outcome (Cuervo 2012). The overall effect was that neutral national policies came to the fore, promoting local and regional competitiveness and subnational economic development.

Regional problems, such as disparities between territories, became the focus of renewed interest in the twenty-first century, strongly influenced by the increasing visibility of ethnic and cultural diversity (Cuervo 2012). In countries including Bolivia, Colombia, and Ecuador, indigenous peoples won constitutional recognition, conferring the possibility of territorial autonomy under special administrative arrangements. Thus "the concepts of subnational political decentralisation came back into fashion, as powerful tools for the identification of existing local resources and facilitation of strategic alliances among actors in a given territory" (Rufián 2009, p. 12, author's translation).

In summary, a review of the literature reveals frequent mention of general objectives for decentralization that include democratic strengthening, the promotion of citizen participation, more efficient provision of public services and public sector investment, the recognition of internal regional diversity, and encouragement of subnational development. But, as de Mattos asks, "how can a politico-administrative reform produce these kinds of deep transformation in the structural bases of national settings, the sum of whose overall conditions and determinants has hitherto been oriented in a completely different direction?" (1990, p. 52, author's translation). Empirical evidence exists that is usually interpreted as supporting the view that fiscal decentralization contributes positively to the well-being of populations (Letelier 2012; Voigt and Blume 2012). Nonetheless, a series of empirical studies, carried out in different parts of the world, suggest a need for caution: their results tend to be as wide ranging and disputed as are the numbers of cases and methodologies, adopted by each one (Letelier 2012).

## Final Remarks

The current consensus defines decentralization as a concept with three fundamental, and equally indispensable, characteristics. The first is that subnational governments have autonomy in their exercise of the responsibilities or authority, or their use of the resources, transferred to them from central government. This implies, inter alia, autonomy in decision-making (within the parameters of the applicable national framework); resource-raising capacity; the authority to implement budgets without conditions being imposed from the center; the power to choose

subnational authorities by democratic means, without central government intervention; and, in countries with the highest degrees of decentralization, the possession of subnational legislative capability. The second overarching characteristic is that the entities which receive transfers must be state organs, a definition which excludes privatizations or deregulation of public goods and services. Finally, the third essential characteristic is that decentralization should be understood as a long-term public policy process whose overall effects are to transfer the responsibilities alluded to above (as distinct from, e.g., a particular or time-limited set of political, fiscal, or administrative initiatives).

Measured against this yardstick, a general survey of decentralization in Latin America does not paint a particularly optimistic picture. Although over three decades of such processes in the region have produced a more decentralized face – evidenced by the consolidation of democratic election as the rule for major subnational authorities, the political and administrative recognition extended in some cases to ethnic groups, and the higher, though still incomplete, levels of autonomy, attributions, and budgetary powers awarded to peripheral governments – the centralizing culture that is typical of the region largely persists (Vial 2013). The literature shows how important decentralizing reforms have either remained limited to formal aspects, without taking substantive real-world effect, or, once implemented, have failed to deliver on the high expectations that they awakened.

# Conceptual Perspective in the Making of Indigenous Policy in Latin America

Verónica Figueroa Huencho
Institute of Public Affairs-INAP, University of Chile, Santiago, Chile

## Synonyms

Indigenous political process; Indigenous strategies

## Definition

Political process that takes place in a certain institutional context, where a complex interrelationship of values and cultural elements is articulated that are important to preserve the indigenous knowledge and to assure its conditions of survival, in accordance with the interests of other actors of power.

## Section

Latin America and Caribbean.

## Introduction

How are indigenous public policies formulated? Which learning's are generated from Latin American and Chilean cases? The analysis of the processes of public policy formulation has been widely studied from different perspectives. However, in recent years, the need to address this analysis from a more complex perspective incorporating indigenous peoples has become increasingly relevant. This involves considering rational or instrumental aspects of the formulation of public policy, as well as subjective factors such as beliefs, values, and cognitive assumptions that underlie the world view of these peoples and influence decision-making.

Therefore, an analysis framework is required to incorporate the claims and demands of indigenous peoples (those who have generally been linked to the territory and the exercise of their rights) but also the interests and values that different actors with quotas have sought to place on the agenda of indigenous politics itself and the visions and paradigms from which decisions, interests, and positions at stake have been formulated, among others.

Considering the above, it is necessary to have a conceptual and empirical discussion that contributes to the generation of such an analytical framework as is necessary to advance toward a better understanding of indigenous peoples, considering the processes of formulation of indigenous public policies in Latin America, their emphasis and trends, as well as those learned that are derived from the Chilean case, which requires clarifying the following aspects: (a) What is meant by the formulation of indigenous public policies; (b) what paradigms and approaches have served as a framework for their development; (c) what type of learning is generated from the Latin American and Chilean case. We will then develop each of these aspects.

## Some Reflections on the Formulation of Indigenous Policy

Generally speaking, the analysis of the processes of public policy has been studied extensively, providing scholars and practitioners of parameters to understand better the variables to consider in this process (Parvin 2009). However, this development is not so clearly evident when it comes to indigenous policies. Following Kovach (2005), recent studies in indigenous politics demonstrate the emergence of processes with their own methodologies that, although they can interpret or criticize existing theories, can hardly be "embedded" in preexisting Western categories (Kovach 2005, p. 29).

This means understanding indigenous policies and their changes as the product of conflicts between different sets of beliefs articulated within the so-called policy subsystem, where different actors have regularly sought to access and influence the definition of problems in public debate and in decision-making (Sabatier and Jenkins-Smith 1999). From this perspective, indigenous policies can be understood as belief systems that articulate the mechanisms to reach certain objectives, visions about possible solutions, and priorities, among other aspects (Olavarría 2010).

In addition, the formulation of public policies can be understood "as a process that takes place in a certain institutional context, which distributes competencies and possibilities of action to those who are in it to promote problems and solutions that they claim, given the specific political circumstances of the moment" (Olavarría 2010, p. 114). The dynamic character of this definition makes it possible to articulate other efforts to situate the discussion around indigenous policies and the elements that should be considered in it. Yanow (1993) understands that these are a process that involves "making sense of tacit knowledge, multiple interpretations, and often conflicting definitions between actors located in different places."

On the other hand, it is a process still linked to the period of colonization and conquest, since the invisibility of the indigenous actor still exists as a strategic subject (Hopenhayn 2001). In addition, the process of indigenous policy-making must be understood as a complex interrelationship of traditional and cultural elements to which society often assigns much less value and which do not lend themselves to quantitative measures and, therefore, are not always included in the formulation of public policies (Banco Mundial 2014).

There are few studies in Chile that address the processes of designing indigenous policies. In that sense, it is possible to demonstrate similarities with the conceptual discussion presented from the empirical level, where there have been public policies since the birth of nation-Chilean state has tended to keep these people in secondary roles in decision-making, being seen as cultures that must be overcome in pursuit of greater modernity

(Walsh 2006). Thus, for Chile, Figueroa (2014) understands this process as an exchange that requires recognizing the existence of a territory, of a world view itself, together with the existence of social, political, economic, and cultural specific that define the set of interrelations and exchanges between different actors (Figueroa 2014).

In this sense, the formulation of indigenous public policies must incorporate elements that allow us a better understanding of the conflict of interests and values between different cultures, where, as a rule, hegemonic cultures have determinates the contents of policies alternatives to indigenous population (Kymlicka 2007).

Basics such as equal rights, representation, and political participation or self-determination, among others, should be analyzed from the perspective they bring with the players in debate. Therefore, talking about diversity, recognition, participation, and decision-making means, in the case of indigenous peoples, recognizing the existence of a social process in formulating indigenous policies regarding the ways in which policyholders decision (mostly belonging to the dominant societies) categorizes these people politically, certainly where the context becomes relevant.

As Zapata (2013) points out, "if we ask who defines who is diverse, we find that there is always a power relationship while there is a framework that holds the discursive power and therefore the monopoly of defining what Is diverse. Hence, when talking about diversity there is always a power relationship and a sector of the population that is not included" (Zapata 2013, p. 15). This applies significantly in the case of indigenous policies in Latin America, particularly in Chile.

## Prevailing Paradigms and Approaches in Formulating Indigenous Public Policy

In the Latin American case, as in the case of Chile, the main paradigms that have served as context for the development of indigenous public policies have been multiculturalism and interculturalism, which represents stages of recognition of social, political, economic, and cultural, differentiated in a specific time frame. In this sense, the model of the nation-state favored by most Latin American countries has promoted an assessment of a Western culture as that which is true, based on principles of liberalism, where everything that does not agree with those values and principles is unknown.

That way has been installed in Latin American societies an epistemic hierarchy that privileges knowledge and Western cosmology of knowledge and non-Western cosmologies, as in the case of indigenous peoples (Mignolo 2000), assuming that human societies were built from the ethnic and cultural homogeneity. This has created conflicts in coexistence because if anything characterizes humanity as a whole, the plurality of cultural expressions is within it (Maldonado 2010).

Consideration of multicultural and intercultural paradigms is relevant to also identify approaches which acquired the indigenous public policy, the points that have been leveraged in decision-making and contextualized some extent, and the causes that led these decisions. That is, who decides and what is decided upon them and even what kind of multiculturalism or interculturalism has tried to promote, prioritize, and implement in Latin America and Chile.

## Multiculturalism and the Rise of "Development" and "Rights" Approaches

Multiculturalism, privileged paradigm by different Latin American governments since the 1960s, has allowed indigenous policies to be formulated without this meaning to question or jeopardize the prevailing nation-state model. In the case of Latin America, multiculturalism has meant managing cultural differences from state policies, which has not been without its complexities. Rather, it has been identified as part of a strategy of domination of hope to establish majorities on minorities but also offers the possibility to create new forms of social and cultural relations (Walsh 2001).

Generally speaking, multiculturalism has been understood as "acceptance of different cultures in society and the active support of these cultural differences by various groups" (Verkuyten 2004) and "cultural acceptance of risk involved complexity relations between different cultures, exploring the identity of each within a context of

power, discourse and experience" (Mc Laren 1995). This has significantly influenced the vision with which they have pursued policies where the duality of multiculturalism-modernity has emphasized linearity in the search for a better state of life for these people.

Within the multicultural paradigm, the "development" and "rights" approaches have been privileged as a framework for the formulation of indigenous public policies, a fact that is evident both for the Latin American and Chilean cases.

The so-called developmental approach was one of the privileged from the origins of multicultural policies, understanding the development "as a desirable state of affairs, ideal, which is expected to reach" (Isla and Colmegna 2005). This led to understand that development evolves and that it is a process that leads, on favorable terms, to a situation of full deployment of physical, cultural, political, economic, and ecological capacities (Martínez Navarro 2000). Because of this approach, hegemonic cultures consider indigenous peoples as not "evolved" and, therefore, this people are in a "lower stage" of modernity.

Thus, public policies aimed at indigenous peoples have been defined unilaterally, because even when you have created instances of participation or spaces for reflection, they have concentrated on "Western" mechanisms of decision-making or have set limits of the discussion so that people do not contravene the interests that are defended from the dominant structures. This has influenced significantly in the vision that has been carried out development initiatives in Latin America with indigenous peoples. Thus the term development itself is often loaded with connotations that relate to the modern idea of "economic progress," an idea that has been widely criticized by many contemporary thinkers (Martínez Navarro 2000).

Within these indigenous policies, the formulation processes focused on the generation of plans, projects, and programs that would strengthen the economic and social capital of these peoples, as a mechanism to incorporate them into the idea of development and progress that the society wanted to generate. Moreover, these policies have encouraged the introduction of concepts such as private ownership of land, generating a progressive loss of the same and a breakdown of the community economies.

Globalization, modernization, and economic adjustments, among other elements that characterized indigenous policy of the time, have produced technological sociocultural restructuring, politically aggravating the precarious situation of most of these people (Hernandez and Calcagno 2003). In these processes, as aggravating the situation, rural-urban migration and employment were added (Plant 1998). This is true for the Latin American case but also for the Chilean case, where a series of rules aimed at dividing indigenous lands and creating reductions and promotion of migration (Bengoa 2000) were issued.

These policies led to questionable results, with some studies report situations of poverty and marginalization of indigenous peoples, which remain to this day. According to the study by the Banco Mundial (2014), being indigenous increases the probability of an individual being poor. Controlling the basic factors that are knowingly associated with poverty, such as age, education, employment status, and region within a country, being of indigenous origin still increases more significantly the chances that a person has of being poor. Thus begin to emerge with force a number of indigenous movements, largely rebelled against the so-called development policies which promoted multiculturalism (Assies 2005, p. 1).

The so-called rights-based approach emerged strongly during the last decades of multicultural policies, where indigenous peoples have called upon states and the international community to respect their individual rights and to recognize a set of collective rights inherent in their status as peoples (Aylwin 2004). These rights include the demarcation and protection of their lands and territories, property, and use and benefit from their natural resources, among others.

Thus, the process of formulating indigenous public policy was placed on the interaction between parent companies and some actors and representatives of the indigenous world as a mechanism to identify critical points on which they must act, being a concrete expression of generating the same rules, laws, and ratification

of international instruments and even constitutional recognition of indigenous peoples.

According to some authors, the scope of the constitutional recognition of indigenous peoples has been varied (Henríquez 2005), from those who have gone from the minimum and essential recognition of the multiculturality of the state to the right of indigenous people to bilingual education. On the other hand, some Political Constitutions have recognized indigenous peoples as originating and preexisting peoples, and the ownership of their lands as a material resource for their cultural and political development.

They have also considered rights to identity and own culture; to preserve, develop, and transmit; to self-determination or self-government according to their customs; to privileged administration over the natural resources in their territories; to ancestral religion as a factor of cultural ethnic identification; to have their own forms of social organization; to participate in local and national politics by electing their own representatives; to be consulted whenever legislative and administrative measures that may affect them are promoted; and to adapt justice to indigenous systems using their uses and customs, among other rights (Henríquez 2005, p. 4).

Thus, in recent years, both changes in the international framework as the consolidation of democracy in several Latin American countries have reconfigured somehow the role of indigenous peoples, who have opened spaces for generating movements They are claiming, among other things, recognition of political, social, and cultural rights along with the defense and recovery of their ancestral lands (Bengoa 2000). This new scenario is relevant to the whole of Latin American societies and the future of democracy, and it poses the challenge of rethinking the political community; mechanisms for citizen inclusion models, preponderant society, and models formulation; and implementation of policies public as defined for indigenous peoples.

In the case of Chile, the enactment of the 1994 Act N° 19.253 was recognition of the existence of indigenous peoples and the creation of specific public institutions responsible for coordinating the efforts that governments develop indigenous issues without progress toward constitutional recognition (an issue that is still under debate). Furthermore, in the case of Chile, only in 2008 the government ratified Convention 169 of the ILO "Indigenous and Tribal Peoples in Independent Countries," after more than 15 years of parliamentary debate, realizing the difficulties which still persist to recognize basic rights of these peoples. That is why Banting and Kymlicka (2006) identified Chile as a country that has had a weak progress on multicultural policies, which has affected the increasing demands and claims of indigenous peoples (Figueroa 2014).

## Interculturalism and the Rise of the "Political" Approach

During the fourth quarter, several Latin American governments have had to face, in one way or another, the consequences of multiculturalism and policies defined without indigenous peoples, reemerging demands, in many cases, of ancestral character, although not part an official political or ideological agenda driving the revision of concepts like nation-state or democracy itself (Kelly 2002).

Thus it emerged a new paradigm that has been installed strongly in Latin America called "interculturalism." Unlike multiculturalism, interculturalism is a new political and social perspective, being considerate as a key concept for academic and practitioner to formulate and implement educational, health and territorial policies to indigenous peoples. For that reason, the interculturalism articulate different efforts to propose accurate actions for the "otredad" (the "ohers") (Garcia et al. 2015).

According to the Royal Spanish Academy, multiculturalism refers to "the relationship between different cultures." It is based on a holistic and human rights approach which "refers to the construction of equitable relationships between cultures, countries, communities and individuals, so that this idea involves recognizing the difference as an inherent aspect of the human being concept and It emphasizes the importance of differences arising from cultural background, as

these are the foundation on which subjects construct their own identities" (Organización de las Naciones Unidas para la Educación, la Ciencia y la Cultura (Unesco). Educación y diversidad cultural. Lecciones para la práctica en América Latina. Santiago de Chile: Unesco; 2008 [Internet] [acceso: 3 de febrero del 2017]. Disponible en: http://unesdoc.unesco.org/images/0016/001626/162699 s.pdf).

Thus they begin to emerge debates about the reformulation of the state, beginning to define them as multiethnic, intercultural, and multicultural, establishing the promotion of diversity as a constitutive principle of their charters and emphasizing the notion that the unit does not imply homogenization of cultural differences, as some constitutions had understood multiculturalism (Uprimny 2011).

Within this paradigm, the "political" approach has been one of the privileged to expand the topics to be included on the agenda as part of the formulation of indigenous public policy. In fact, some constitutions have recognized indigenous peoples as originating and existing towns and ownership of their land as cultural material resources and political support of the existence of those. Policies have also incorporated the rights to identity and own culture; to preserve, develop, and transmit; to self-determination or self-government according to their customs; to privileged administration over the natural resources in their territories; to ancestral religion as a factor of cultural ethnic identification; to have their own forms of social organization; to participate in local and national politics by electing their own representatives; to be consulted whenever legislative and administrative measures that may affect them are promoted; and to adapt justice to indigenous systems using their uses and customs, among other rights (Henríquez 2005, p. 4).

Another concept used for public policy is political participation, which is linked significantly to the concept of self-determination in the sense of allowing the generation of specific spaces to ensure that it were indigenous people who make their own decisions and can act free and informed on all those factors that affect their own development. As noted in the previous section, much of the mistakes that have incurred multicultural policies aimed at indigenous peoples are that they have not been formulated respecting their world view and that they remain marginal players in the process.

As Meza-Lopehandia (2010) points out, in the case of Chile, the current constitution hinders the exercise of true democracy, especially the exercise of the rights of indigenous peoples. In Chile only recognized is the existence of a nation, but it is necessary to consider the existence of different peoples, an issue that is complex since our constitution only recognizes one people exercising sovereignty, excluding indigenous peoples of the political body. This can be evidenced in a weak multicultural paradigm without adequate progress toward the incorporation of multiculturalism.

This also occurs in the specific area of the territory. As described in some research, recognition of the territory was not considered in the Law N°19.253 where the solution is delineated to individual land ownership and regularization of tenure by communities. Thus it speaks of "indigenous lands" whose property holders will have as indigenous individuals or the indigenous community defined by the law itself. Along with this, the role of the state to protect indigenous lands, ensuring their appropriate exploitation and ecological balance and providing for their expansion, is recognized. This start is given to one of the points in dispute which remain until the current government who has been part of the permanent demands of indigenous peoples: the restitution of ancestral territory and support of the development of indigenous peoples (Figueroa 2014).

## Main Lessons Learned from the Latin American and Chilean Case

The main lessons that emerge from Latin American and Chilean reality can be summarized in three points. First, the conceptual development in indigenous public policy formulation is emerging. Despite the existence of historical relations between the state and indigenous peoples, studies are scarce and must nourish the conceptual discussion from the results of the implementation of

indigenous policy, thus generating a mapping exercise "in reverse," where evidence constitutes a substantive support for analyzing how, when, and why certain emphasis on indigenous policy, paradigms, and approaches that prevailed emerged. Thus, there is a wide range of theoretical and empirical development that can become an opportunity to strengthen a research agenda for academics and practitioners.

Second, the formulation of these policies stresses the broader around other processes that do not involve culturally distinct peoples' conceptual discussion, thus accounting for the need to incorporate new analysis dimensions to this process in order to promote a better understanding of these phenomena. Among them, the "cosmovision" becomes a key dimension to ensure that the design process incorporates visions not always valued and recognized by the other but that they become a powerful predictor to ensure an adequate later implementation. Also, as happens with the formulation of other policies, it cannot be analyzed without reference to power. However, power analysis cannot be understood in the abstract but needs to be located from the reality experienced by indigenous peoples and historically define the secondary place of today.

Third, the need to broaden the analytical framework becomes relevant considering the paradigms that have served as a backdrop to recognize the scope and emphasis of the formulation of indigenous policies. While multiculturalism has become a paradigm that has framed most studies about indigenous peoples, practice has shown certain limitations by not considering specific aspects specific to the reality that, historically, have faced indigenous peoples. Consideration of new paradigms such as interculturalism or others should also be incorporated into the analysis of indigenous policies.

## Conclusions

The process of formulating indigenous public policy is an aspect little studied and therefore poorly understood, resulting in a significant difficulty in having greater conceptual precision to facilitate their inquiry from a methodological point of view. The need for a framework of analysis considers not only the claims and demands of indigenous peoples (those that have generally been linked to the territory and the exercise of their rights) but also the interests and values that different actors with power quotas have tried to place on the agenda of decisions, which are not always part of the government.

According to some studies, one of the major factors that have influenced the current conditions of indigenous peoples is the lack of adaptation and integration of cultural, valuables, and historical and social elements, among others, in designing public policies, a factor which is essential if it is expected to avoid uprooting and marginalization (Parvin 2009). However, these elements cannot be analyzed in the abstract without considering the debate issues related to power or colonization of knowledge. Ultimately, indigenous peoples can relate to measures or initiatives that do not take into account their values, attitudes, beliefs, world view, or forms of organization, among other things (Inkeless 2000).

# Conflict Dynamics

Benjamin T. Jones[1] and Shawna K. Metzger[2]
[1]University of Mississippi, Oxford, MS, USA
[2]National University of Singapore, Singapore, Singapore

## Synonyms

Arbitration; Disputed issues; Disputes; Escalation; Evolution; Longevity; Negotiation; Process; Resolution

## Definition

Changes within a contested issue space over time with respect to actor behavior or the issue's broader environment.

## Introduction

An understanding of "conflict dynamics" requires an understanding of each of the phrase's words.

"Conflict" has been defined in two principal ways in the literature on organizational behavior (Thomas 1992, p. 265). First, it has been defined in *broad* terms. Pondy's (1967, p. 298) seminal work epitomizes this definition, as he argues that "conflict" is composed of four parts: (1) antecedent conditions (those creating the possibility for disagreement between actors, like resource shortages); (2) emotions (what he calls "affective states," such as stress and hostility); (3) perceptions of the situation; and (4) behavior (e.g., overt coercive violence, such as militarized behavior). Vasquez and Mansbach (1984, p. 428) emphasize similar constituting dimensions: (1) issue dimensions, relating to the item under contention; (2) opinions about the disagreement (agreement–disagreement); (3) behavior (positive–negative acts); and (4) disputants' resultant attitudes (friendship–hostility). Broad definitions are useful for discussions of conflict dynamics, insofar as they call attention to the entire process, and force scholars to think about how everything connects. At the same time, though, these approaches tend to be more descriptive. On their own, they are not falsifiable, nor do they generate specific predictions about observable phenomena.

Second, conflict has been defined in more *specific* terms by focusing on "a sharp disagreement or collision in interests between two or more actors" (Jones et al. 1996, p. 168). Defined in this way, conflict amounts to a bargaining problem in which two actors disagree over the allocation of an issue and must agree on how to divide it (Fearon 1995). An issue represents one or more concrete objects "seen as possessing or representing the desired" goals of an actor (Hensel 2001, p. 82). Conflict-as-specific studies are subsequently interested in how disputants manage the conflict. How long does the disagreement last? Do disputants enter into formal negotiations to resolve their differences? Does a neutral arbiter facilitate the negotiations? Do the negotiations succeed? Do the disputants resort to coercion to resolve the disagreement? Does the coercion resolve the disagreement, or does the disagreement still persist? Do disputants use both negotiations and coercion in an effort to resolve the dispute? A conflict-as-specific definition gives scholars more leverage for making inferences because it lends itself to generating falsifiable claims from an argument. However, such specific definitions can induce a "blinders effect" in which scholars focus on a specific type of observed behavior within the conflict (e.g., coercive) and eschew other types of observed behavior and how these behavior types may be interdependent. In a similar way, the definition's specificity can lead scholars to eschew the rich, broader context in which the behavior occurs and how this context may affect behavior.

Both conflict definitions make clear that conflict is a *process*, one composed of latent and observable traits. To speak of process automatically necessitates a time element, meaning that conflicts are not resolved instantaneously. Conflict has an ebb and flow, and scholars observe the conflict across time to "better understand how [it] begins, progresses (e.g., escalates, militarizes), terminates, and/or potentially recurs" (Jones and Metzger (forthcoming)). Time can be demarcated in a variety of ways, ranging from hours to weeks to years.

To speak of conflict *dynamics*, then, refers to how the conflict process can exhibit change across time. Social scientists have examined conflict in various settings. Examples include labor disputes, protests, interstate disputes, civil wars, contract negotiations, domestic crime and enforcement, legislative bills, and intrapersonal disagreements. Yet, regardless of context, important commonalities exist with regard to the *source* of the conflict's change across time. A useful framing heuristic is thinking of one disputant's behavior within a conflict and asking "what causes the disputant's behavior to change?" At minimum, three possibilities exist: other disputants (dynamics between actors), alterations specific to the conflict environment (dynamics across stages), or alterations to any environment in which the disputants are embedded (dynamics across levels), though the list is not exhaustive. The answer also greatly influences the ways in which scholars marshal evidence to support their claims.

## Dynamics Between Actors

### Description

The most obvious influence on a disputant's behavior is the behavior of the other disputant. Here, the dynamic element within a conflict originates from the actions of one actor toward the other, and the latter's responding action at a subsequent moment in time – an "action–reaction"-type argument. Cooperation theory suggests that "like produces like" – the action taken by one actor toward another is likely to garner a similar response (i.e., reaction) from the others (Axelrod 1984). For example, work on foreign policy behavior primarily focuses on the way in which two actors, usually states, interact with one another from period to period. Hostile behavior by one state in one period may elicit a similarly hostile response from the other state in the next period, whereas friendly behavior would invoke reciprocal friendliness.

Notably, an actor's reaction to an initial action is unlikely to be only a function of that initial action. Behavioral inertia (Goldstein and Freeman 1990) and rational expectations (Williams and McGinnis 1988) are also at work. All three factors together provide leverage for studying a disputant's behavior in many contexts. Modeling the response of protestors to government repression and vice versa is one example (Moore 1998). Protestor behavior is a combination of reacting to government repression (reaction), the protestors' own behavior in the past (inertia), and the protestors looking ahead to the future and acting strategically (rational expectations). The same is true for the government's behavior.

In addition, a disputant's actions may be in response to the actions of *many* other disputants, not just one. These additional actors may be additional states – for instance, modeling the actions and reactions of the North Atlantic Treaty Organization (NATO), Bosnia, and Serbia during the Bosnian conflict (Goldstein and Pevehouse 1997), or they may include domestic actors within states, for example, taking into account how shifts in domestic public opinion might impact states' actions and reactions in an ongoing conflict (Brandt et al. 2008). In these more complex situations, dynamics still arise from the interplay of each actor's behavior and the differential responses of the other actors involved in the conflict that follow from that initial behavior.

### Methods for Analysis

Both formal and empirical models often serve as the evidentiary basis for claims regarding the interaction between actors. Formal models are deliberate abstractions of the process under study, and usually take game-theoretic form, akin to a decision tree (Osborne and Rubinstein 1994). Formal modelers elucidate the number of interacting actors, the preferences/goals of these actors, the actions available to actors at each point in time, and the resultant outcomes from these actions. In conflict situations, one actor's goals are the opposite of the other actor's goals; accordingly, actors' preferences are defined as diametrically opposing. Scholars then solve the game-theoretic model for its equilibrium – the optimal action(s) for an actor to take to reach an outcome best fulfilling the actor's goals, given the likely actions of others. Formal models are well suited for thinking systematically about how actors strategically behave, given a set of constraints and preferences. They are also adept at generating falsifiable statements about the process of interest. However, formal models themselves cannot test whether the inferences they generate are borne out by real-world data from the process.

Empirical tests do utilize real-world data. Tests pertaining to actor dynamics rely on time series and longitudinal methods. Most empirical models view dynamics unfolding across time as a "nuisance" to making accurate inferences about some factor's effect on an outcome and simply want to correct for the nuisance's presence. By contrast, time series methods view modeling dynamics as an important exercise in its own right, one with substantive import for better understanding the process of interest (Enders 2009; Pevehouse and Brozek 2008). Longitudinal methods have a similar emphasis, but also usually have many panels'

worth of information on multiple subjects (Skrondal and Rabe-Hesketh 2004). As a result, longitudinal methods also equally emphasize accounting for a process' subject-specific attributes, again in the service of improving inferences about both the process' dynamics and certain factors' effect on an outcome.

### Comparison to Other Conceptions of Dynamics

Time is inherent to studying conflict dynamics arising from the actions and reactions of actors, as actions and reactions unfold in a sequential order – reactions necessarily follow actions. However, change over time sometimes reflects more than just progressing from one time period to another. Specifically, the conflict may progress from one stage to an entirely different stage. Dynamics between actors share a superficial overlap with conflict dynamics arising across stages (discussed more in the following section). However, the former emphasizes the actions and reactions of the actors in the conflict, whereas the latter emphasizes the structure of the environment, or stage, in which actions and reactions are occurring.

From the perspective of conflict dynamics arising between actors, conflict stages receive little attention. *If* stages exist, the dynamics-between-actors perspective views stages as a labeling convenience, simply marking a difference in actors' potential costs and/or benefits when formulating their reactions to one another. Fundamentally, little else changes. The importance (i.e., weight) an actor places on various costs and benefits, for instance, remains constant. Equation 1 provides a stylized cost-benefit expression for some action A at time $t$ for an actor, to make these points concrete. $\omega$ represents the importance of a cost or a benefit to the actor, with higher values representing greater importance and therefore, greater weight. An actor's $\omega$ derives from its perceptions, beliefs, and broader features of the environment in which the interaction is occurring. Within the framework of conflict dynamics arising between actors, Eq. 1's costs and/or benefits may change in value from one "stage" to the next, perhaps appreciably so. However, this framework also implicitly assumes that the broader environment in which actors interact with one another remains constant. As a result, within this framework, the $\omega$'s remain the same across time. That is, the importance ascribed to the benefit by the actor at time $t$ is the same as the ascribed importance of the benefit at $t+1$, $t+2$, and so on.

$$\begin{aligned}&\text{Expected Utility of Action A}\\&\quad = \omega_b(\text{benefits}) - \omega_c(\text{costs})\end{aligned} \tag{1}$$

The above suggests two fundamental assumptions with respect to conflict dynamics arising from actors' actions and reactions. First, the conflict process' environment – e.g., the internal structure of either actor, the broader system's characteristics and structure in which the actors are nested, aspects of what the actors' interactions are regarding, and so on – does not change (Frieden 1999). If true, actors' actions and reactions within the conflict are mostly independent of the stage they occupy, such that the primary source of the actors' behavior is their prior respective actions. Second, and related, is that actors' decision-making calculi are constant across stages. Actors respond to costs, benefits, and others' actions in the same way, regardless of the conflict's stage. More broadly, the implication is that the structure of actions and reactions between the actors remains the same. Equation 1's $\omega$'s remain constant.

## Dynamics Across Stages

### Description

A second source of dynamics can be the different stages (or phases, synonymously) composing a conflict process. Stage is a collective term encapsulating the structure of the environment in which actors interact, and there is theoretical reason to believe that the environment affects actor behavior. Put differently, stages are no longer a labeling convenience, as they were in the dynamics-between-actors perspective. Rather, the conflict moving from one stage to another indicates that some aspect of the environment has changed in a way that affects actors' valuation of $\omega$. Thus,

within this framework, stages denote when at least one of Eq. 1's $\omega$'s changes in value, meaning that how actors weigh their costs and benefits is now *conditional on* which stage of the conflict process they occupy.

Often, a process' stages are delineated based on a set of observable criteria. For example, a territorial dispute between states could have four stages, based on states' actions toward one another at time $t$: (1) existence of a status quo challenge, in which one state has explicitly made statements that challenge the territory's current ownership status, but no settlement attempts are underway; (2) active negotiations, in which disputant states are engaged in bilateral talks, arbitration, or mediation in an effort to resolve the dispute; (3) militarized settlement attempt, in which disputant states are engaged in threats, displays, or uses of military force toward one another in an effort to resolve the dispute; and (4) resolution, in which a new status quo is agreed upon by both disputants. However, a process' stages may also be latent, in that we can only infer indirectly whether a process is composed of many stages, and if so, what the process' current stage is. Regardless of how the stages are defined, the movement of a conflict from one stage to the next has important implications for the conflict process as a whole, as well as scholarly understanding of it. Accordingly, a number of studies have begun to conceptualize conflict not as pertaining to any one particular stage, but rather as a broader process comprising each of these stages (Levy 1995).

Within this framework, dynamics arise not only from the interactions between actors from one time period to the next, but also from the particular stage the conflict occupies. At the core of a stage conception of conflict dynamics is the claim that the conflict process' different stages fundamentally alter the environment in which interactions between actors take place. As the conflict environment in which interactions between actors takes place changes at a fundamental level, it suggests that the causal process yielding a conflict outcome of interest is likely subject to considerable complexity (Braumoeller 2003; Jervis 1997). The implication is, depending on the particular stage a conflict occupies, the same factor or similar patterns of interaction between actors may have fundamentally different effects. That is, depending on the stage in question, the "basic structural elements vary in their relation to each other. In other words, the variables in the bivariate relationship are right, but the relationship is not constant (i.e., the $\beta$'s vary)" (Goertz 1994, p. 15).

For instance, we can imagine a simple example in which a conflict comprises two stages: ongoing warfare and active negotiations. Importantly, factors increasing the likelihood of actors commencing negotiations may make it substantially more difficult for those same actors to actually implement any agreement they reach (Findley 2013). Analogously, Fearon (1998) distinguishes between the bargaining and enforcement stages of an agreement and demonstrates that the factors that make *enforcing* an agreement easier may make *reaching* such an agreement considerably more difficult.

Additionally, a focus on the stages that compose a conflict yields another form of conflict dynamics: the sequence in which a conflict transitions through these stages. Many studies make a simplifying assumption that a conflict transitions through its stages in a straightforward, linear manner, progressing from the first stage, to the second, to the third, and so on (Diehl 2006). However, many conflict processes exhibit a fair degree of complexity in the timing and sequence of transitions between conflict stages. This complexity may be of considerable importance, because particular transition sequences may yield varied outcomes of interest. For instance, particular sequences may systematically correspond with a higher likelihood of peace within states than others (D'Orazio and Yonamine 2015).

## Methods for Analysis

Empirical models have been the primary way in which researchers assess claims about dynamics across stages. Which tool is most appropriate depends on the claim under investigation. Regime-switching models allow the effect of different factors to be conditional upon a process' stage (Piger 2011). There are many variants of regime-switching models, with different degrees

of complexity, but most regime-switching models are rooted in the time series literature (e.g., Freeman and Jackson 2012). However, these models can be hard for non-time series experts to utilize because of their complexity. One alternative is multistate survival models, which are instead rooted in the duration analysis literature (Metzger and Jones (forthcoming)). Multistate models permit researchers to assess how many stages compose a conflict process of interest, how the disputants transition through these stages, and how the effect of certain factors varies depending upon the conflict's stage. Finally, sequence analysis is another tool with both descriptive and inferential power (Casper and Wilson 2015; Mills 2011, chapter ▶ "Organizational Environment"). Sequence analysis can provide descriptive information about how processes' transition sequences compare to one another. Sequence analysis can also yield inferences with respect to how certain factors make particular sequences more or less likely. Further, sequence analysis can also investigate claims in which *sequences* are the factor affecting outcomes.

## Dynamics Across Levels

### Description

Finally, dynamics can originate from different levels of analysis. Under this view, each level of analysis acts as a structure in which actors are embedded (Jepperson and Meyer 2011). In a static system, the structures in which an actor is embedded affect the actor's behavior, because actors are often assumed to be both strategic and utility-maximizing (Frieden 1999). For instance, bureaucratic behavior within a state is a product of the procedure and rules within a government agency and also the rules and procedures that dictate how and when the agency is to interact with other governmental bodies. If we move to international politics, states are constrained from both below and above: domestic politics within the state can have repercussions for how states behave toward other states (Putnam 1988), and the rules (or lack thereof) in the interactional system also affect how states behave toward other states (Waltz 1979). In short, even in a simple world observed at a single point in time, actor behavior is a product of the actor's preferences *and* the structure(s) in which the actor is embedded.

Dynamics arise when changes at one level of analysis affect a disputant's behavior within a conflict. For instance, a global shift in the distribution of military power – a change at the level of the international system – may spur individual states into action for myriad reasons. If states were satisfied with the previous status quo, they may act to restore it; newly powerful states may act to obtain all the trappings and benefits to which they believe their new power entitles them; run-of-the-mill states locked in bilateral conflicts may minimize or maximize their resolution efforts, particularly if their foreign policy attention needs to be diverted elsewhere. Additionally, changes at one level of analysis may also first affect change at other levels of analysis which then affect an actor's behavior.

### Methods for Analysis

Assessing claims about dynamics across levels of analysis is no small feat. Mathematical modeling has arguably been the mainstay of this body of work, in the spirit of Lewis Richardson's (1960) early work on the dynamics of arms races using differential equations. Researchers define the conflict system using a series of equations to capture the various forces theorized to be at work and derive the equilibrium conditions for the entire system. They can then compute comparative statics to see how a quantity of interest in the system responds to changes elsewhere. For empirical tests of conflict dynamics across levels, hierarchical models are adept at capturing the effects of variables at different levels of analysis in longitudinal settings. However, Chaudoin et al. (2015) point out that complex interactions, particularly across levels of analysis, require more sophisticated methodological tools than those that currently exist. More work will certainly be done on this front in years to come. For an applied example, Braumoeller's (2012) systemic theory of Great Power behavior is an excellent illustration of mathematical modeling (differential equations)

and empirical modeling (hierarchical models) working together to support an argument about dynamics across levels.

### Comparison to Other Conceptions of Dynamics

Dynamics across levels and dynamics across stages are very similar. Both involve changes to the environment, which in turn produce changes in actor behavior. A stage conception of dynamics usually focuses first and foremost on actor interactions and how stages can have conditioning effects on actor-specific or actor pair-specific factors that influence an actor's behavior. Importantly, changes brought about via levels of analysis could easily fit into a stage framework, as changes in one level may certainly shape the environment in which actors interact. However, levels are usually are not incorporated, likely as a function of where the theoretical emphasis is being placed in a stage framework. By contrast, changes across levels are usually conceptualized as entirely separate factors in their own right. Further, changes across levels, in many instances, are assumed not to have conditioning effects on other factors. Again, there is no reason why this must be so. A potentially powerful avenue for future research could involve stage conceptions of dynamics and level-of-analysis conceptions coexisting within the same framework.

## Analysis and Conclusion

To conclude, the notion of conflict dynamics centers on describing and analyzing how and why a conflict process – either a narrowly defined disagreement or a more expansive understanding including the lead up to and aftermath of such a disagreement – changes over time. All three conceptions of conflict dynamics above involve a time element, in that researchers are observing the conflict episode at various points in time. The presence of time is a necessary condition for investigating dynamics. However, beyond this, dynamics can manifest in myriad ways. The conceptions here draw attention to *where* the impetus for a disputant's behavior arises from – that is, whether conflict dynamics arise from the actions and reactions between actors, transitions from one stage of a conflict process to another, or from the interplay across distinct levels of analysis. Each "origin" of conflict dynamics offers unique insights into when, why, and how conflicts evolve over time, while simultaneously lending themselves to distinct methods of analysis. Which conception is most useful depends on the researcher's question, and the theoretical underpinnings of the researcher's argument. Clearly theorizing the impetus' source is essential because different sources speak to alternative empirical strategies for evaluating conflict dynamics.

In practice, all three conceptions are likely present in any given context, because the actors we theorize about in the social sciences are one constitutive piece of a larger, complex process. Indeed, developing the theoretical and empirical models to simultaneously account for multiple sources of conflict dynamics represents a fruitful path for future analyses of conflict dynamics. The three conceptions of conflict highlight many of the implicit assumptions underlying arguments about each conception of dynamics, which may not be reasonable in all applied settings. For dynamics between actors, is it reasonable to assume that all else is being held constant, with respect to the different structures in which an actor is embedded? If not, what effect might the transition from one stage of the conflict process to another, a fundamentally distinct environment, have on the actors' actions and reactions in the conflict? Analogously, analyses that focus on dynamics arising across levels of analysis do not typically account for how such dynamics may condition the actions and reactions of actors in a conflict. By taking into account multiple sources of conflict dynamics at the same time, future analyses can contribute new insights into the behavior of actors in conflicts and the manner in which both their own behavior and shifts to their environment jointly contribute to the course of the conflict process.

The three conceptions define conflict in specific terms, speaking to actors' observable behavior. Broader definitions of conflict reinforce the various conceptions, as they speak to attributes of a conflict that could change, and in so

doing, affect a disputant's behavior. Overarching the three conceptions is an interest in viewing conflict processes from a causal angle, which can differ from a purely descriptive approach to conflict dynamics. A causal angle is rich in potential, particularly for public policy questions. A specific instance of conflict (e.g., Finland and Russia's territorial dispute over Petsamo) is one example of a type of process, which may share similar dynamic elements relevant to a conflict process of the same type (e.g., Argentina and Britain's territorial dispute over the Falkland Islands). Understanding what factors affect how long conflicts last, whether conflicts escalate in intensity, and which resolution methods are effective (and when they are effective) is powerful knowledge for shaping policy discourse. As a result, hypothesizing about general factors that increase or decrease the likelihood of some behavior of interest takes on greater import.

Conflict management; Stress management; Work overload stress

## Definitions

**Conflicts** are the varieties of social relations in which the conflicting parties realize their interests, needs and aspirations in a bitter struggle.

**Stress** is the body's reaction to any change that requires an adjustment or response when the body reacts to these changes with physical, mental, and emotional responses.

**Job resources** are physical, psychological, organizational aspects of the job that help achieve work goals, or stimulate personal growth, learning, and development.

## Introduction

Conflicts and work-related stress are growing concerns in developing countries due globalization and the changing nature of work. The impact of stress can be seen in many aspects of a human's life, in particular during COVID-19 pandemic. It is evident that the feelings and perceptions of stress when people do not have enough time, skills, or financial resources to effectively handle personal or professional demands. Research has indicated that conflicts and work-related stress are considered a cause of many different diseases. Conflicts and stress in the workplace not only impact individual performance but also the organization's effectiveness as a whole. Conflicts at workplace and work-related stress may affect the organization's effectiveness due to costs associated with increased absenteeism and staff turnover, replacement of absent workers, increased unsafe working practices, accident rates, complaints from clients/customers, and reduced productivity, performance, and profitability of organization ((Nguyen et al. 2014).

## Conflicts at Workplace

The definition of conflict is multifaceted. According to the interpretation presented in the dictionary, conflict (from lat. Conflictus – collision) is a clash of parties, opinions, forces. The conflict is considered both in a broad and in a narrow sense. In a broad sense, conflict is interpreted as one of the varieties of social relations in which the conflicting parties realize their interests, needs, and aspirations in a bitter struggle. In a narrow sense, conflict is interpreted as

one of the varieties of social interaction, characterized by a direct and deliberate clash of its participants.

Today, the world is in an era of global change, conflicts are inevitable and are part of the public sector, NGO, and companies' human capital management process. There are different aspects of conflicts: the social tension, the confrontation between employees and their supervisors, and disagreements between the leaders. Conflicts could bring negative and positive outcomes. According to Adises (2017), "changes provoke disintegration – there will always be those who are able to turn the changes to their advantage, and those whom innovations frighten and paralyze… As a result, conflict management is becoming one of the main tasks of managers" (p. 1). Deivy (2020) suggests that "good teams are able to go into a productive conflict for the sake of finalizing ideas, stimulating innovation and reducing risks" (p. 1). If the teams at workplace are able to enter into a productive work conflict by expressing disagreement, discussing different points of view and working in difficult circumstances, these teams usually offer more innovation.

William Wrigley, the American king of chewing gum, once remarked that business is built by dissenting: "When two always agree, one of them is superfluous" (Lovrich and Chamorro-Premusik 2018). In business, politics, public administration, sports, and art, we can find different examples of successful partnerships, fueled not only by creative tension or disagreement.

Many scholars analyzed a different attitude toward conflict. Conflict, as a phenomenon, is always undesirable, which should be avoided and resolved as soon as possible. Such an attitude can be clearly seen in the writings of authors belonging to the school of scientific management, administrative school. Authors belonging to the school of "human relations" were also inclined to believe that conflicts should be avoided. But if there were conflicts in the organizations, then they considered this as a sign of ineffective activity and poor management. The modern point of view is that even in organizations with effective management, some conflicts are not only possible, but may even be desirable. In many cases, the conflict helps to identify the diversity of points of view, provides additional information, helps to identify problems, etc.

According to Kozer (2000), conflict has social functions, and certain level of conflict is "necessarily dysfunctional, but it is an essential component of both the process of formation of a group and its sustainable existence" (p. 51).

There are three stages in the development of the struggle of interests that lead to conflict:

- Differences of opinion
- Contradictions in the discussions
- Direct struggle in the form of conflicts in actions

There are following types of conflicts:

1. By sources of origin (conflicts of interest, values, identification)
2. By social consequences (successful, unsuccessful, constructive or constructive, destructive or destructive)
3. By scale (local, regional, interstate, global, micro-, macro-, and mega-conflicts)
4. Forms of struggle (peaceful and non-peaceful)
5. Characteristics of the conditions of origin (endogenous and exogenous)
6. In relation to the subjects of the conflict (genuine, random, false, latent)
7. Tactics used by the parties (battle, game, debate)
8. Fields of activity (economic, political, environmental, labor, social security, education, and others)
9. In relation to a separate subject (internal (personality conflicts) and external (interpersonal, between a person and a group, intergroup))
10. On the psychological aspect (motivational, cognitive, role-playing and other conflicts)
11. By nature:
    - Objective, related to real problems and shortcomings
    - Subjective, due to various assessments of certain events and actions

To resolve the conflict, you must:

- Determine the type of conflict
- Causes
- Features
- Apply the resolution method necessary for this type of conflict

A two-dimensional model of personality behavior in conflict interaction, developed by Thomas and Killman, is widely used in conflict management. This model is based on the orientation of the parties to the conflict to their interests and those of the opposite side. The participants in the conflict, analyzing their interests and those of the opponent, choose one from five behavioral strategies (struggle, withdrawal, concessions, compromise, and cooperation).

## Work-Related Stress

Stress can be positive and motivating when it is short, for example, you need more quickly submit reports: sometimes the work is done more efficiently under pressure of deadline. Moreover, the work in conditions of constant scarce resources, including time, is mid-level stressors. A similar tension occurs when a person has (1) difficulty in dealing with employers, (2) worries about career development, and (3) the tasks contradict each other. Risk of serious and chronic stress increases when there are sudden changes in working conditions or when a person is deprived of the support of colleagues, family and leadership. Stress is formed from a combination of these factors and the inability to relax. Prolonged activation of the stress response causes wear and tear on the body – both physical and emotional. The results of constant work-related stress are complex somatic pathology, reduced adaptive abilities of the organism, chronic fatigue syndrome earn, weakness in the morning, frequent headaches, insomnia, conflicts, or susceptibility to loneliness. Stress also becomes harmful when people use negative coping mechanisms as compulsive use of substances or behaviors to try to relieve their stress: food, alcohol, tobacco, drugs, gambling, sex, shopping, and the Internet. Rather than relieving the stress and returning the body to a relaxed state, these negative coping tend to keep the body in a stressed state and cause more problems at work and home.

According to the Globe Research Project (2020), Russian respondents had the lowest score for uncertainty avoidance practices of the 60 sample countries. There are a relative acceptance of ambiguity and uncertainty within the workplace along with a desire for greater workplace rules and certainty in the future in Russia. Russia experienced economic crises in 1992, 1998, 2008, and 2016–2017 that led to dramatic impoverishment of population, social anxiety, and high level of stress. These crises brought a lot of financial and social problems to Russia, including high level of inflation and unemployment. Russia experienced two serious economic crises in 1992 and 1998 that were accompanied with drop in personal income and rapid impoverishment. Start of transition period (a "shock therapy") occurred in 1992 after political decision to accomplish a rapid transition to market economy. The consumer prices grew 3.5 times faster than wages in 1992 and exploded by 2500% for the 1992. According to StatBureau (2019), inflation rate in Russia was 2508.85% in 1992. That is 2348.44 more than it was in the preceding 1991 and 1668.98% more than in the following year of 1993 (StatBureau 2019). During the time of transition, population of Russian federation had to deal with: (1) increased demands of learning new skills; (2) the need to adopt new ways of working; (3) the pressure of the demand for higher productivity and higher technical and computer skills; (4) demands for increased quality of work and time pressure; (5) higher job competition; (6) increased job insecurity and less benefits; and (7) less time for coworkers and socializing. Moreover, majority of people lost their life savings, were deprived of their social benefits, and experienced higher level of corruption and criminal activities. All these changes caused increase in the stress level among Russian population resulting in the psychotic, stress-related disorders.

Declining health status was also closely connected to the stress-induced illnesses. The study conducted in 2018 among 1,500 respondents in two Russian cities of Vologda and Cherepovetc revealed that among respondents who reported experiencing stress often or very often, 18% reported having regular headaches, 35% regular illnesses, 9% stress-related short-term disability, 7% stress-related long-term disability, and 34% stressed-induced various chronic conditions. This is in comparison to corresponding 9%, 16%, 2, 2, and 26% of the same conditions among respondents who reported experiencing stress seldom. Among respondents who reported having regular stresses, 12.7% evaluated their health is poor compare to 6.1% of respondents who reported having no or low stress in their lives (Korolenko 2019). In addition, there are many problems in the health care system in Russia. According to Rozenfeld (2019), "medical facilities at many different levels of the formerly hierarchical system have become deeply involved in the problems of day-to-day financing of their activities. The main state programs for improving the health of the Russian population are underfunded and suffer from lack of resources in general. No conditions can yet be foreseen for the reanimation of an effective preventive and curative health care system" (pp. 3–4).

Russian employees perceive a lack of clarity of work roles where employees perceive conflicting demands in the workplace. This conflict contributes to reduced job performance and job satisfaction, and increased tensions on the work and family relationship (Engle et al. 2018). In Russia, managers have to spend a lot of efforts on defending themselves in response to pressure from top managers. This can cause stress. Another feature of the Russian corporate stress is the habit of bringing personal problems to work. Russian leaders are traditionally broadcast their emotions on subordinates. Davidova and Kozmina (2014) found that only in Russia "nonmaterial job resources like power potential and opportunity for interpersonal communication affect both stress levels and job satisfaction. In other countries, they are not associated with stress levels and are only sometimes correlated with job satisfaction" (p. 172). In addition, occupational stress and job satisfaction are also affected by factors external to professional activities, such as family and children. When stress persists or occurs repeatedly, it can have various negative effects on workers and the companies they work for. Psychosocial stress may manifest itself as depression, anxiety, domestic violence, increase of smoking, work injures, increase of alcohol consumption, and divorce.

Many studies propose healthy coping mechanisms to decrease work-related stress, include exercise programs, stress reduction programs, and efforts to increase job satisfaction. Webster (2014) suggests that "approach strategies are generally considered healthy, as they attempt to address problems or emotions head-on. Avoidant strategies are not generally considered healthy, as they are used to simply escape problems or emotions, sometimes to the point of denying their existence" (p. 845). Morash et al. (2006) found that organizational psychologists employed to monitor negative workplace conditions can reduce employee stress. Healthy coping mechanisms may help an individual feel better immediately and experience benefits to their overall health and well-being. Some examples of healthy coping mechanisms would be exercise, getting adequate sleep, eating a healthy diet that includes nutrient-rich fruits and vegetables, and having social support (family, professional peers, and religious counterparts). Patterson (2004) suggests that "seeking social support buffered the relationship between work events and distress, and emotion-focused coping buffered the relationship between life events and distress" (p. 215). Many scholars suggest to use the following tips for coping: (1) keep a positive attitude at workplace and at home; (2) use positive coping; (3) accept that there are events that you cannot control; (4) be assertive instead of aggressive and assert your feelings, opinions, or beliefs instead of becoming angry, defensive, or passive: (5) talk with friends, peers, and loved ones; (6) learn and practice relaxation techniques, exercise, walk in nature; (7) make time for hobbies and interests; (8) get enough rest and

sleep to recover from stressful events; (9) do not rely on negative coping as alcohol, drugs, or compulsive behaviors to reduce stress.

## Conclusions

Conflicts and work-related stress can be positive and motivating when they are short, for example, you need to more quickly submit reports: sometimes the work is done more efficiently under pressure of deadline. Moreover, the work in conditions of constant scarce resources, including time, which are mid-level stressors, can lead to negative outcomes. This situation occurs when a person has (1) difficulty in dealing with employers, (2) worries about career development, and (3) the tasks contradict each other.

Risk of serious and chronic stress increases when there are sudden changes in working conditions or when a person is in conflict situation and deprived of the support of colleagues, family and leadership. Stress is formed from a combination of these factors and the inability to relax. The results of constant work-related stress are complex somatic pathology, reduced adaptive abilities of the organism, and chronic fatigue syndrome earn. The symptoms of work-related stress are fatigue, weakness in the morning, frequent headaches, insomnia, conflicts, or susceptibility to loneliness. People can learn to manage stress and lead happier, healthier lives.

Russian citizens lived through a unique political and economic transition in the 1990s, many financial and economic crises, pandemic in 2020. These changes not only created new challenges but also resulted in high level of stress in the country, including high level of work overload stress.

# Conflicts of Interest in the Public Sector

Rolando Ochoa
Department of Security Studies and Criminology, Macquarie University, Sydney, NSW, Australia

## Synonyms

Cronyism; Favoritism; Traffic of influence

## Introduction

Corruption can cause severe losses to a country's economy, as well as to its overall social development. As such it is one of the main governance challenges faced today in many regions of the world. Corruption can take many forms and includes behavior such as bribery, extortion, nepotism, cronyism, self-dealing, misuse of information, and abuse of discretion among many others. A common expression of corruption, conflicts of interest (COI here forth), involves a situation in which the public function of an official is unduly influenced by their personal interests. When this occurs the society does not get the best public policy outcome.

There is often confusion about what constitutes a COI in a specific situation. Indeed, COI does not have a universal meaning as many practices are culturally specific. Networks of political patronage may be fraught with COI but described as "business as usual." The lobbying – and indeed money donations – of government by corporations is legal in many cases but a gray area when it comes to COI.

## Defining Conflict of Interest

Corruption and its definition have been the subject of much academic and policy output (Graycar and Villa 2011; Graycar and Prenzler 2013; Ochoa and Graycar 2016). Rose-Ackerman's original work on the economics of corruption (1975) is one of the cornerstones of the field. Other researchers have focused on, for example, corruption culture (Uslaner 2010) and historical analyses of corruption (Friedrich 1972). Globalization and economic development have placed a new focus on issues such as transparency in public affairs and conflict of interest (Auby et al. 2014). These issues have the capacity to seep into the international arena as Chayes (2015) has argued. The United Nations Convention Against Corruption, ratified by over 160 states (Joutsen and Graycar 2012), includes in section four of Article Seven a provision which encourages signatory states to design and implement policies and laws that enhance public sector "transparency and prevent conflicts of interest" (UNCAC 2012). A simple definition of conflict of interest would entail a conflict between the official obligations and the private interests of a person in a position of trust. Morreim (2011) has defined COI like this:

> A conflict of interest is a structure that carries an invitation. The structure is comprised of (1) a relationship featuring a strong obligation based on trust – for professions, a loyalty in which the provider places the beneficiary's interests above his or her own interests, and (2) an opportunity to act contrary to that obligation. The invitation arises when such an opportunity is sufficiently attractive that it poses a significant temptation to override the obligation.

The Organisation for Economic Cooperation and Development (2005: 13) offers the following definition:

> A conflict of interest involves a conflict between the public duty and the private interest of a public official, in which the public official's private capacity interest could improperly influence the performance of his/her official duties and responsibilities

Esadze (2013) divides the concept of COI into three different dimensions:

- *Actual*, where there is a direct conflict between a public official's current duties and responsibilities and existing private interests.
- *Perceived* . . .where it . . .appears that a public official's private interests could improperly influence the performance of their duties – whether or not this is in fact the case.

- *Potential*, . . .which arises where a public official has private interests that could conflict with their official duties in the future.

This classification means that there is a significant range of COI and thus addressing this issue is a complex undertaking. Conflict of interest presents an obstacle for the fair and impartial development of public policy and other forms of government activities (Ochoa and Graycar 2016). When private interests, financial interests, control interests, status interests, patronage interests are at odds with public functions, conflict of interest obviously arises. This is not confined to ruling elites, for in the lives of many people a situation could arise where some form of COI is foreseeable. It may be something as simple as having a contact help you jump to the front of a line, or whether or not to recommend a family member for a job, or to use an employer's resources to carry out nonrelated tasks. The truly negative aspect of it begins when, fuelled by private interests, actors fail to carry out their duties or attempt to profit from them, thus harming the communal good.

COI is not limited to developing and/or failed states. It is pervasive and can be found in all contexts and nations. It is, however, often difficult to pinpoint as cultural and contextual variables shape its analysis. This has clear implications for regulatory agencies. COI is found in the public sphere and private enterprises, and examples of regulation are found in both civil service codes of conduct and commercial regulation. For example, insider trading in the stock exchange is widely prohibited and is a good example of COI. The public and the private often intersect as often happens in the granting of infrastructure contracts or in some relationships between politicians and private firms. Conflict of interest permeates the political arena. It underscores much of political action as it is by definition the management of group and individual interests (Ochoa and Graycar 2016). Regulation of such interests is generally in the interest of policymakers. However, it does not follow that all COI will be perceived as such or will generate a desire for regulation in all places all the time. In simple terms, there are no universal forms of COI, rather, a set of behaviors that at different times and places undermine the political and democratic process (Ochoa and Graycar 2016).

COI can find expression in many levels, it can be individual when a person has a COI in a certain situation, and it can be sectoral whereby a number of entities within a sector (for example, the tobacco industry) have a COI, as outlined in the cases below, and it can also be group-based when a team or a group of people find themselves in a situation where COI arises. It is important to clarify the differences between *potential* and *perceived* COI as noted above. The main characteristic of perceived COI is that in many cases it is irrelevant whether COI exists or not. The public believes there may be COI, and this perception can have a real impact. On the other hand, potential COI arises when there is a real possibility of COI that can be preempted by regulation (Ochoa and Graycar 2016).

COI may take many shapes and forms. It is a subject which is especially dependent on local contexts, perceptions, cultures, and institutional norms. Is an overarching definition of COI really needed? Is the design of COI regulation at the international level, as through the United Nations Convention Against Corruption, an effective way to go about tackling COI? Or, is local level action a more effective strategy? These are all questions to challenge researchers and practitioners.

Understanding COI as a deviation from policy paths that have as their ultimate goal the greater good, or at the very least the effective provision of a public good, invites a policy response. Pervasive corruption can have a very long-lasting effect on the functioning of government institutions (Varese 2000) and widespread conflict of interest, much like acts of corruption, can have a direct cost to the taxpayer and to the effective delivery of public goods. The impacts of COI may have different effects depending on the policy sector in which it happens. In the health sector, it may lead to poor emergency services or lack of availability of quality drugs and medical treatment, in the infrastructure sector it may lead to poorly engineered or over-budget works which may well require extra investment later on. Moreover,

COI may also have nontangible but detrimental effects when it is present during regulatory processes, for example, in unduly influencing legislators in granting telecommunications licenses, designing tax reform and changing other regulatory frameworks or granting government contracts. Conflict of interest can also have a detrimental effect on public confidence in institutions and general trust in government. When cases of COI make headlines, it has a direct impact on people's confidence in their institutions and this in turn can negatively affect the democratic process.

## Policy Responses

There are mainly two mechanisms which can aid in the control of COI: *governance* and *social control*. Governance refers to areas which are regulated almost exclusively by the state such as administrative regulations of government agencies, the creation and enforcement of laws, as well as the management of financial resources. Social control refers to areas which may involve other actors as well as the government (Ochoa and Graycar 2016). These include creating networks of social actors to monitor and tackle COI, as well as advocacy and education efforts taken into action by the state in league with other social actors.

Thus there is a two-tier structure which hosts COI control and prevention. On the macro level, governance and social control are found as instruments for policymakers, at the micro level there are specific mechanisms through which the mentioned instruments are actually implemented and actioned. There are three main *governance* mechanisms which are used to tackle COI (Ochoa and Graycar 2016):

1. *Laws*. Laws are the key structure which supports efforts to stem conflict of interest. All countries that have ratified the UNCAC have laws against corruption. Most of these also contain specific mentions of COI.
2. *Administrative regulations*. These either operate as subordinate legislation or are agency specific such as codes of ethics, internal agency regulations, and transparency and access to information structures. These may regulate potential and perceived COI.
3. *Money*. Control of resources and financial matters is also a tool for the state to control COI. A system of financial penalties which punishes incidences of COI can be classified as falling within this sector which may aid in the regulation of all forms of COI, from government ethics to resource regulation and the behavior of government agents.

With regards to *social control* there are two mechanisms that can be used (Ochoa and Graycar 2016):

1. *Networks*. Networks of stakeholders can be developed or used by the state or some of its agencies and officials. These networks would have the ultimate goal of providing oversight and accountability to government officials with regards to conflict of interest. These mechanisms can be especially beneficial since they enhance multisectoral/multidomain approaches to preventing COI. Domains to be included in these networks can include NGOs, advocacy groups, international organizations, and government agencies. Networks can be used to regulate most instances of conflict of interest. This mechanism can be used to tackle cases of perceived COI such as the case of public-to-private transitions mentioned above.
2. *Advocacy*. Activities taken by institutions or individuals which pursue a certain goal and influence a decision-making process can have a ring of advocacy. Advocacy can be of assistance in dealing with conflict of interest by creating an environment of awareness and knowledge of COI and its causes, costs, and consequences. Advocacy can be central to prevention efforts, as it helps educate and transmit information so different stakeholders can take action to tackle COI. Advocacy can be used to regulate and prevent perceived conflict of interest as well. Advocacy can serve many purposes and at its best is an important incentive for enterprises and public figures to avoid instances of conflict of interest.

Laws include specific sections of penal codes related to corruption and COI, as well as other specially designed laws to monitor and assert COI in different government agencies. On the administrative front, codes of conduct and disclosure regulations are commonly used forms of COI control. Social control mechanisms are rarer and seem to be somewhat unused. In the authors' (nonrepresentative) sample, networks are used a little more than advocacy.

## The Issue of Policy Evaluation

Measuring success and evaluating the effect of inputs and outcomes is a challenging task. An evaluative framework for success of COI countermeasures is not easy because information is not readily available and measurement is nearly impossible. Quantifying the instances of successful COI prevention suffers from the same challenges as measuring prevention success. It is difficult to measure the instances of COI that *did not happen*. Prosecuted cases on the other hand may provide some information on success rates as well as a decline in COI after policies have been implemented. It is known, however, that prosecution in COI cases is a rare event, and convictions are rarer still. However, the challenge of creating effective evaluation mechanisms remains, not only for COI but also for other forms of corruption. A simple mechanism is to ask three quick questions. Is the intervention any good? Is the situation better than that which existed before? Is it worth it? Each of these questions can be answered quickly and intuitively, or each can be the subject of a longer and more rigorous evaluative project.

## Conclusion

Since before the signing of the UNCAC, and certainly afterwards, efforts have been made in many regions to bolster and design structures that control and prosecute these actions. There is widespread consensus on the negative impacts of corruption and conflict of interest in a country's productivity, development, and attractiveness for investors. Conflicting public and private interests do coincide and do so often, particularly at the intersections of public and private enterprise where monetary gain can be substantial and thus presents an incentive to ignore conflict of interest and give preference to private gain.

It is important to recognize that certain social structures, norms, and practices will at times blur the boundaries between what is acceptable behavior and what is not. What is considered a conflict of interest in one region or country may be an acceptable behavior in another. Thus a fully normative approach to COI, as much as it may be necessary for the design of policy instruments and initiatives, can and should be put into question. What is not up for questioning is the need to tackle this issue and in so doing countries have been using both national and international frameworks to design policy instruments to tackle COI. This needs to be done, however, with a deep knowledge of local circumstances, histories, and political arrangements. Thus it is very important to reconcile international mandates with local contexts.

# Consolidated Accounts

Elisa Mori
Department of Economics "Marco Biagi", University of Modena and Reggio Emilia, Modena, Italy

## Synonyms/Related Words

Consolidated Financial Report; Consolidated Financial Statement

## Definition

Consolidated accounts represent a set of accounts that combines the financial results of a group of entities by combining the financial statements of separate legal entities controlled by a parent entity into one set of financial statements. The consolidated financial statement (CFS) is the result of consolidation.

## Consolidated Accounts: Introduction

Consolidated accounts represent a set of accounts that combines the financial results of a group of entities, rather than showing the results of each entity separately. The consolidated financial statement (CFS) is the result of consolidation. It combines the financial statements of separate legal entities controlled by a parent entity into one set of financial statements for the entire group but does not substitute single entity financial statements.

Consolidated financial statement of a group shows the assets, liabilities, equity, income, expenses, and cash flows of the parent and its subsidiaries as those of a single economic entity.

The term economic entity defines a group of entities comprising the controlling entity and any controlled entities.

Both the parent entity and the subsidiaries will continue to operate its respective activities and each will issue its own financial statements. However, politicians, managers, citizens, and other stakeholders could find helpful to know the financial results and the financial position of the *economic entity.*

The main purpose of consolidation in the public sector is to provide an overview of the financial performance and position, not only of the single government but also of the decentralized government entities.

At this purpose, financial information are combined after eliminating all inter-entity transactions and shown as belonging to a single reporting entity.

While consolidated financial reporting is widely adopted in the private sector, the preparation of consolidated financial statements is still developing in the public sector. Over the last decades, public sector accounting and CFS have been influenced by the private sector.

## The Growing Importance of CFS in the Public Sector

The increasing decentralization of public service production and delivery has led to the establishment of different types of entities which are "connected" to governmental organizations at the central and/or local levels, with different legal form (public or private) and different degree of ownership (totalitarian, majority, minority).

Hence, traditional annual reports of governments do not consider the financial consequences of subsidiaries, joint ventures, and associates included in a public group and

disclose only a partial view of their economic and financial situation, thus not giving a true and fair view of the current economic status of the whole of a public group (Wise 2004, 2006; Osborne and Brown 2005; Bundred 2006; Tagesson 2009).

Governments progressively changed their role from service providers to regulators and become, at the same time, the owners of its subsidiaries and the purchasers of services they produce.

Decentralized entities interact with the government in order to realize policies and programs. As a result, internal (e.g., politicians, managers, auditors, and employees) and external users (e.g., citizens, voters, taxpayers, suppliers, other public administrations, banks, and rating companies) of financial information are not able to base their decisions on reliable and relevant information about the financial position, financial performance, and cash flows by looking only at the government entity (Grossi 2009). On the contrary, this kind of relationships require for a more comprehensive accounting and reporting system for financial and political accountability (Almqvist et al. 2013).

Their inclusion in the programming and control systems of the parent is essential also because of the strategic importance of services provided by subsidiaries and because of entities size, per number of employees and turnover.

Both science and practice consider consolidated financial reporting as a useful instrument to support decision-making processes in planning strategies and verifying their impacts and to ensure higher public accountability and transparency (Chan 2003; Chow et al. 2007; Benito et al. 2007; IPSASB 2011) bringing the economic performance and financial position of the group in a single document.

## International Standards on Consolidation

Although not all countries have adopted CFS and it is not so diffused in the public sector, in some countries, accounting standards for consolidation of accounts have been established. Some of these countries are, for example, Sweden, the UK, the USA, Canada, New Zealand, Australia, and Italy.

At the international level, a series of accounting standards for the public sector (International Public Sector Accounting Standards or IPSASs) have been established by the International Public Sector Accounting Standards Board (IPSASB), with the aim of facilitating the convergence of international and national standards, thereby enhancing the quality and uniformity of financial reporting throughout the world.

IPSASs are high-quality global financial reporting standards. They relate to the general-purpose financial statements (financial statements) and are authoritative, but their application is not compulsory. In fact, IPSASB recognizes the right for governments and national standard setters to establish their accounting standards within their jurisdictions. In fact, IPSASs are not enforceable on territorial authorities, but they have a supportive function for legislators in developing new standards or revising existing ones. IPSASs represent the only internationally accepted public sector accounting model and therefore they can serve as a guideline. For these reasons, the following paragraphs discuss the contents of IPSASs.

IPSASs are applicable to public sector entities other than government business enterprises (GBEs apply International Financial Reporting Standards (IFRSs)). Public sector entities include national governments, regional and local governments (e.g., state, provinces, territorial governments, cities, towns), and their component entities (e.g., departments, agencies, boards, commissions).

Considering the consolidation of annual accounts, the IPSAS 6 (*Consolidated and Separate Financial Statements* (last version December 2006)), IPSAS 7 (*Accounting for Investments in Associates* (last version December 2006)), and IPSAS 8 (*Financial Reporting of Interests in Joint Ventures* (last version December 2006)) are to draw up the consolidated financial report (CFR) and are applicable to all levels of government. In January 2015, IPSASB issued IPSAS 35 (*Consolidated Financial Statements*), IPSAS 36 (*Investments in Associates and Joint Ventures*), and IPSAS 37 (*Joint Arrangements*) with the aim to

supersede IPSAS 6, 7, and 8 from January 1, 2017.

The abovementioned standards are on an accrual basis. In the development of IPSAS, the board has set two priorities:

1. Convergence with *International Accounting Standards* (IASs/IFRSs) issued by the *International Accounting Standards Board* (IASB), while taking account of unavoidable differences among public and private companies
2. The preparation of specific accounting rules for the public sector, in response to different needs that cannot be shared with those of private sector

In particular IPSAS 6, 7, and 8 correspond, respectively, to IAS 27, IAS 28, and IAS 31, with which they show little differences. Also the new standards IPSAS 35, IPSAS 36, and IPSAS 37 are largely based on IFRS and IAS and try to align with the Government Finance Statistics and the System of National Accounts.

An entity that prepares and presents financial statements under the accrual basis of accounting can apply these standards in the preparation and presentation of consolidated financial statements for the economic entity.

## Methods of Consolidation

There are several theories on how to compile CFS and to define the public group. The different theoretical perspectives are the following: the entity perspective, the parent company perspective, and the proprietary perspective (Grossi 2015).

These perspectives are important for consolidated financial statements and for determining the distinction between liabilities and equity. They affect whether the effects of transactions are viewed from the perspective of the entire consolidated group or solely from the perspective of the parent entity.

The entity perspective of a public group considers the economic unity of all the entities and minority shareholders are included in the equity. On the contrary, the parent company perspective focuses on the shareholders of the parent entity. This means that minority shareholders are considered as outsider interests and are seen as liabilities.

The proprietary perspective considers ownership which gives the possibility of exercising significant influence over the entity. Noncontrolled interest is not disclosed in the CFS.

IPSAS found inspiration in the parent company perspective as a model for consolidation accounting rules.

The methods of consolidation generally adopted are three: full consolidation, proportional consolidation, and the equity method of consolidation.

Full consolidation method is a full line-by-line aggregation of values, with no distinction between majority and minority shareholders. Assets and goodwill of subsidiaries are adjusted according to their fair value, and minority interests are reported as a separate item in the consolidated financial position, between equity and provisions. At the same, the operating result is distinguished between those pertaining to majority and minority interests. A full consolidation requires the elimination of all the transactions and balances occurring among the entities subject to consolidation. This requires a systematic identification and recording of all such transactions in the entities.

The proportional consolidation method of accounting lists the assets and liabilities in proportion to the percentage of participation of the parent. This method records income and expenses from the subsidiary in the calculation of its assets and liabilities for inclusion on its balance sheet and income statement. Noncontrolling interest is excluded from the CFS in order to account for the ownership interests of the parent company in other entities.

The equity method can be seen as an alternative of the proportional consolidation, where only the owned share of the subsidiary's net asset and the share of the net operating income are included in the CFS. On initial recognition, the investment in an entity is recognized at cost, and the carrying amount is increased or decreased to recognize surplus or deficit in investor's share after the acquisition date.

## The Determination of the Area of Consolidation

The first issue to face when compiling CFS is the determination of the area of consolidation on the basis of the "reporting entity" concept. The term reporting entity refers to the specific entity that is the subject of a set of financial reports. Identifying the area of consolidations means defining the government-owned entities and the existing relations between the single entity and the holding one.

Two ways of defining the area of consolidation are internationally diffused. The first one, more diffused, is based on the concept of control. The second one requires the presence of financial accountability. Here we consider the first criterion.

Public sector is different from private sector because control relationships are not always based on ownership. Furthermore some entities can have no legal personality or control over an entity which can be due to legislation or by contract, without any ownership relations.

An entity, regardless of the nature of its involvement with another entity, shall determine whether it is a controlling entity by assessing whether it controls the other entity.

According to IPSAS 35 the definition of control focuses on an entityâ€™s exposure to variable benefits from its involvement with the other entity and to the ability to affect the nature and amount of those benefits through its power over the other entity.

According to what is exposed in paragraph 20, "*an entity controls another entity if and only if the entity has all the following: (a) power over the other entity; (b) exposure, or rights, to variable benefits from its involvement with the other entity; and (c) the ability to use its power over the other entity to affect the nature or amount of the benefits from its involvement with the other entity.*"

A controlled entity is not excluded from consolidation because its activities are dissimilar to those of the other entities included in the economic entity.

This is a new and more wide definition of control respect to preceding IPSAS 6 and may impact previous assessments of control, whether certain entities should be consolidated or not.

Looking at IPSAS 6 (par. 20), the notion of control is based on "the consideration of the nature of the relationship between the two entities. This means that the controlling entity needs to be able to govern decision-making in relation to the financial and operating policies as to be able to benefit from its activities." This standard talks about the power and benefit conditions (see IPSAS 6, par. 39): benefits can be both financial and nonfinancial; for example, the controlling entity may benefit from the ability to direct the other entity to work with it to achieve its objectives. Similarly, the existence of control does not require an entity to have responsibility for the management of the other entity and does not necessarily require an entity to hold a majority shareholding or other equity interest in the other entity.

The concept of control in IPSAS 35 is based, similarly to IPSAS 6, on "power and benefit elements," but those concepts are interpreted in a different way. An entity has power over another entity when the entity "has existing rights that give it the current ability to direct the relevant activities" (par. 23), for example, the right to direct the financial and operating policies of another entity. It is important to note that in the public sector, this does not derive only from voting rights. An entity may also obtain power over another entity conferred by binding arrangements without having an equity instrument providing evidence of a financial investment.

The assessment of whether such instruments give rise to power over another entity may be complex and require more than one factor to be considered.

In addition, according IPSAS 35, an entity can have power over another entity even if its rights to direct have yet to be exercised or even if the second one has statutory powers to operate independently from the first one.

Lastly we can talk about control when an entity has the unilateral ability to direct different relevant activities of another entity or has significant influence on it, even if other entities have existing rights that give them the current ability to participate in the direction of the relevant activities.

Looking at the concept of entity's benefits from its involvement with the entity being assessed for control, it can be financial (e.g., returns such as dividends or similar distributions, cost savings), nonfinancial (e.g., support in achieving objectives/outcomes or providing services, benefit from a specialized knowledge), or both (see IPSAS 35, par. 31).

Financial benefits include returns on investment such as dividends or similar distributions, exposure to loss from agreements to provide financial support, and cost savings (see IPSAS 35, par. 32). Nonfinancial benefits include "advantages arising from scarce resources that are not measured in financial terms and economic benefits received directly by service recipients of the entity" (e.g., the provision of services that the parent entity would have otherwise been obliged to provide, the ability to benefit from specialized knowledge, improvement of outcomes, or efficiency).

It is important to note that control over an entity requires the ability to use power to affect the nature or amount of benefits received by the mentioned entity.

When control does not exist, it becomes necessary to understand whether the subsidiary could be a joint venture or an associate.

IPSAS 37 classifies joint arrangements as either joint operations or joint ventures. In a joint operation, the parties to the arrangement have "rights to the assets and obligations for the liabilities relating to the arrangement." In a joint venture, the parties to the joint arrangement have "rights to the net assets of the arrangement" (par. AG27). These classifications differ from IPSAS 8 which identified three types of arrangements (jointly controlled entities, jointly controlled operations, and jointly controlled assets). According to IPSAS 8 (par. 6), joint control is the agreed sharing of control over an activity, and a joint venture is a binding arrangement whereby two or more parties are committed to undertake an activity that is subject to joint control.

Differently to IPSAS 8, IPSAS 37 requires that joint ventures account for their investment using the equity method, while the previous IPSAS 8 permitted jointly controlled entities to be accounted for using either the equity method or proportionate consolidation.

IPSAS 36 illustrates the application of the equity method, which must be used when accounting for joint ventures and associates. The requirements are very similar to the current guidance in IPSAS 7, but the latter should be applied when a local government has significant influence in an associate that is neither a controlled entity nor a joint venture.

On the contrary, IPSAS 36 shall be applied when an entity has a significant influence over another entity, or joint control of it, and the investment leads to the holding of a quantifiable ownership interest, in the form of a shareholding or other formal equity structure or in another form in which the entity's interest can be measured reliably. The existence of significant influence is usually evidenced in the following ways (see IPSAS 36, par. 12): "*representation on the board of directors or equivalent governing body of the investee; participation in policy-making processes, including participation in decisions about dividends or similar distributions; material transactions between the entity and its investee; interchange of managerial personnel; provision of essential technical information*" (Tables 1 and 2).

## Structure of Consolidated Financial Statement

Consolidated financial statements provide information of value to government politicians and officials as well as to various external stakeholders, such as citizens, voters, taxpayers, and lenders of funds.

Consolidated financial statements include a consolidated statement of financial position, a consolidated income statement, and a consolidated statement of cash flow.

A controlling entity shall prepare consolidated financial statements using uniform accounting policies. If a member of the economic entity uses accounting policies other than those adopted in the consolidated financial statements, items of single financial statements must be adjusted and/or reclassified according to the same basis.

**Consolidated Accounts, Table 1** Consolidation of accounts according to IPSAS 6, 7, and 8

| | IPSAS 6 consolidated financial statements | IPSAS 7 accounting for investments in associates | IPSAS 8 financial reporting of interests in joint ventures |
|---|---|---|---|
| **Area of consolidation** | Controlled entities "Concept of control" | Associates "Significant influence" | Joint ventures (jointly controlled entities, jointly controlled operations, and jointly controlled assets) "Joint control" |
| **Methods of consolidation** | Full consolidation | Equity method | Equity method or proportional consolidation |

Elaboration of the author

**Consolidated Accounts, Table 2** Consolidation of accounts according to IPSAS 35, 36, and 37

| | IPSAS 35 consolidated financial statements | IPSAS 36 investments in associates and joint ventures | IPSAS 37 joint arrangements |
|---|---|---|---|
| **Area of consolidation** | Controlled entities "Extended concept of control" | Associates or joint ventures "Significant influence or joint control" | Joint arrangements (joint operations or joint ventures) |
| **Methods of consolidation** | Full consolidation | Equity method | Equity method |

Elaboration of the author

The consolidated statement of financial position, also known as the consolidated balance sheet (or condition), combines the financial statements of the controlling entity and its controlled entities line by line, by adding all of the cash, receivables, assets, net assets/equity, and liabilities of the economic entity at a specific point in time, after eliminating in full intra-economic entity assets, liabilities, net assets/equity, and cash flows.

The assets represent the financial or non-financial group's resources, such as cash, receivables, inventories, properties, and equipment.

The total assets (balance) equal the sources of funding: liabilities (external borrowings) and equity.

In preparing the consolidated statement of financial position, it is necessary to eliminate the carrying amount of the controlling entity's investment in each controlled entity and the controlling entity's portion of net assets/equity of each controlled entity (international or national accounting standards explain how to account for it).

The consolidated balance sheet is used by investors, creditors, and other decision-makers to assess the public group's overall financial and patrimonial situation, for example, the composition of resources and the level of external obligations.

The consolidated income statement (also known as consolidated statement of profit and loss, consolidated earnings statement, or consolidated operations statement) represents the details of the revenues that the economic entity earned from outside users and the expenses incurred through its exchange activity of production factors with the outside in a period of time (the generally accepted period of time is the solar year).

Revenues and expenses arising from transactions within the group must be eliminated in full.

The consolidated income statement separately itemizes revenues and expenses, which result from the public group's ongoing major or central activities, and the gains and losses arising from incidental or peripheral transactions. Extraordinary items, and effects of accounting changes, are presented separately.

Operating income, net of tax effect, is represented at the end of the consolidated statement.

The results of the public group's operating activities for the period as presented in the income statement provide information that can be useful

to predict the amount, timing, and uncertainty of future cash flows.

The operating income is a key indicator of the extent to which the operations of the group are funded by taxes or from the recipients of goods and services provided by the group.

Determining the profitability of operations is secondary for public administrations; rather a consolidated income statement gives the information of what is spent for the community.

Financial statements include notes, which constitute an integral part of the statements. The notes contain required disclosures of additional data, assumptions and methodologies that have been used, and other information deemed useful to stakeholders (such as information about investments in associate, events after the reporting date, information about the employees); International Public Sector Accounting Standards (IPSASs) offer guidelines for the content of the statements described above.

## Conclusion

The present contribution offered an overview about the theoretical approaches and methods of consolidation generally accepted for the preparation of CFS. The importance of using CFS as a tool for improving financial accountability of governments is recognized because, in the last decades, they tend to delegate a big part of their services to various types of subsidiaries.

The above paragraphs described IPSASs as generally accepted international standards for public sector. It is important to note that IPSASs are not the only existing standards; government and national standard setters can adopt their own standards, and this poses problems of comparability.

The above theories and perspectives on consolidation offer positive features, but they also carry some problems.

One of the most critical issues while consolidating is the definition of the area of consolidation.

The dominant criterion for determining the area of control according to the different existing standards considers the benefit and control conditions and requires the controlling entity to have the ability to govern decision-making of the controlled entity as well as to benefit from its activities.

The concept of control – defined according to power and benefits conditions – is more difficult to find in the public sector than in the private sector, because power does not always correspond to ownership but concerns, for example, entities that fulfill public sector functions or services and are mainly dependent on the government budget. For this reason, recently IPSASs have been significantly revised.

Information needs in the public sector are different from those of the private sector and this does not always fit with the IPSAS approach to consolidation.

Another issue concerns methods of consolidation. In general, full consolidation and the equity method are the most diffused both at international and national level. These two methods can lead to some disadvantages in the true and fair representation of information (overestimation or underestimation of values).

Some adjustments in the consolidation methods will probably be necessary for better comparability and accountability.

Maksim Mokeev
Department of Public Administration, The Stolypin Volga Region Institute of Administration, Russian Academy of National Economy and Public Administration, Saratov, Russia

## Synonyms

Law; Main document of country

## Definition

Main legal act that has the highest legal force, fixing the basis of the constitutional system, the basis of the legal status of man and citizen, the system of bodies of state power, and the principles of the organization of government.

## Introduction

The Constitution of the Russian Federation is a legal act, which has the highest legal force, fixing the basis of the constitutional system, the basis of the legal status of man and citizen, the federal structure, the system of bodies of state power, and the principles of the organization of local self-government.

"We, the multinational people of the Russian Federation … adopt the Constitution of the Russian Federation." This is the first sentence of the document that has established a wholly new concept of statehood and society in Russia.

The Commission on Constitutional reform was first created in June 1990, but by 1993 it had rejected several draft constitutions. In May 1993, the president convoked the constitutional assembly to prepare the draft constitution. The assembly had considered different proposals and ideas and finished its work in October. The draft constitution had been published for national-wide discussion.

More than 54% of Russian citizens took part in voting on December 12, 1993, and 58.4% of them voted for the Constitution. The adoption of the Constitution by national referendum has broken up the development of the Soviet type of organization of government and has legally stated the recognition of democratic values and directions of social, political, and economic development which dominate over societies with older democratic traditions.

Considering the nature of the Constitution as the fundamental legal document, Veniamin Chirkin says that the value of the Constitution of the Russian Federation is determined by three main factors: (1) it is the legal formulation of the political victory of an antitotalitarian democratic revolution that has transformed the relations of power and property, personal status, and the foundations of social and state order; (2) in difficult conditions of the 1990s, it was the agreement on

preventing the civil war, on the "approval of civil peace and harmony" (preamble of the Constitution); (3) it is a kind of social contract about the basic values of the constitutional order.

The preamble declares the confirmation of constitutionalism in Russia and the transformation of the state into the rational organization of public authority for the accomplishment of public functions within the framework of the law (Kremyanskaya et al. 2014).

Legal features of the Constitution which are signs that distinguish it from the acts of the current legislation are the following:

1. *The constituent character* of the Constitution. It demonstrates that its rules consolidate the foundations of the state and the social order and establish an institute, which is implemented through state power, and the principles of their establishment and functioning.
2. *The legitimacy* of the Constitution. It was adopted by popular vote.
3. *The supremacy* of the Constitution. It has a priority position in the system of laws and regulations in force in the territory of Russia.
4. *The direct action* of the Constitution. This means that the provisions of the Constitution of the Russian Federation shall have direct effect, that is, their implementation is not required as a condition of additional, specifying laws. However, many provisions of the Constitution of the Russian Federation, by the high level of generality of legal regulation, require additional regulation by the adoption of acts of the current legislation.

The Constitution contains two sections with 9 chapters embracing 137 articles.

The first section consists of nine chapters:

1. The Fundamentals of the Constitutional System
2. Rights and Freedoms of Man and Citizen
3. The Federal Structure
4. The President
5. The Federal Assembly
6. The Government of the Russian Federation
7. Judicial Power and Prosecution Office
8. Local Self-government
9. Constitutional Amendments and Revision of the Constitution

The second section is called "Final and Transitional Provisions."

The major role in the constitutional regulation belongs to the fundamentals of the constitutional system stated in the first chapter. These are the basic principles and norms which define the form of government, the political regime, and the legal base for relations between public institutions, society, and citizens.

Thus, the Constitution proclaims Russia a democratic federal law-bound state with a republican form of government. It also recognizes human rights and freedoms as the supreme value and a subject of observance and protection by the state (Baudoin 2014). The first chapter also sets the following fundamental constitutional principles:

1. The bearer of sovereignty and the only source of power in the Russian Federation shall be its multinational people.
2. The sovereignty of the Russian Federation shall cover the whole of its territory. The Russian Federation shall ensure the integrity and inviolability of its territory.
3. The Russian Federation is a social state whose policy is aimed at creating conditions for a worthy life and a free development of man.
4. The state power in the Russian Federation shall be exercised on the basis of its division into legislative, executive, and judicial power. The bodies of legislative, executive, and judicial power shall be independent.
5. In the Russian Federation local self-government shall be recognized and guaranteed.
6. In the Russian Federation ideological diversity shall be recognized. No ideology may be established as state or obligatory one.
7. The Russian Federation is a secular state. No religion may be established as a state or obligatory one, etc.

The second chapter of the Constitution declares rights and liberties of humans and citizens to be guaranteed and protected. The

Constitution does not only establish the fundamental rights of the citizen (as before in Soviet Constitutions), but it enshrines the fundamental rights of the humans and citizens to the international standards (and in some cases above) and their legal guarantees (in particular in articles 45–55). The most important provision in this part is the thesis about the human as a supreme value (art. 2).

The Constitution has incorporated innovative provisions of the socioeconomic, political, and ideological nature (the variety of forms of ownership, the integrity of economic space, a free flow of goods, services and financial resources, support for competition, and the freedom of economic activity, social state, ideological diversity and a ban on obligatory ideology, political diversity and multi-party system, secular state, position of religion) (art. 2, 7, 8, 13, 14, etc.).

The Constitution also established new institutions and a new *political system*. Chapters 3–8 describe the federative structure of Russian Federation and the fundamentals of the organization and functioning of its public institutions: the president, the federal assembly, the government, the judicial power, and the local self-government.

V. Chirkin emphasizes that the Constitution has introduced some new elements to the world Constitutional Law (for example, for the first time given, though inaccurate, determination of the nature of power in constituent entities of the Federation (art. 5, 11, 77, etc.), the ratio of state power and local self-government (art. 12)).

The Russian Constitution establishes three procedures to change its text: amendments (chapters 3–8), the revision of the Constitution (chapters 1, 2, and 9), and a change in the text (article 65).

## Conclusions

The Constitution of the Russian Federation contains a complex regulatory framework of the state system (form of government, state sovereignty, separation of powers).

The constitutional text has been influenced by several foreign regimes, such as the French and American systems. Indeed, different foreign experts were consulted by the Constitutional Committee. But the "final product" remains a hybrid product that borrows from several models without reproducing any of them completely. Thus the President of the Russian Federation shall determine the guidelines of domestic and foreign policy, has a legislative veto power, may be impeached by the Council of Federation just as the US President, but it also has the right of legislative initiative and the right to issue decrees without the consent of the Parliament. Other aspects take the Russian system away from the US presidential model. For example, the Russian Constitution establishes a government headed by a president of government, appointed and dismissed by the President of the Federation upon consent of the State Duma. Additionally, another major difference should be highlighted: the Duma may be dissolved by the *President of the Russian Federation*.

In 2013, the Constitution survived its 20th anniversary with several amendments only. Some revisions can be analyzed as simple adjustments that did not lead to major changes in the constitutional system. This is considered to be quite a long period of time for the constitution in a transitional society. Most of the politicians, researchers, and experts in constitutional law incline to believe that the proposals to change the constitution or even adopt a new one seem to be unjustified as the Russian Constitution has not exhausted its potentialities at all.

# Constitutional Federalism and Public Administration

Sean T. Adkins
Virginia Tech University, Blacksburg, VA, USA

## Synonyms

Constitution; Devolution; Federalism; Government; Interpretation; Jurisdiction; Law; Levels of government; Municipalities; Public administration; Shared powers; States

## Definition

Public Administration: In the United States, it is an academic discipline and a field of broad scope that is geared toward the understanding of policy and how it is carried out in regard to the government and public sector. It has the fundamental goal of advancing management and policies to improve the functioning, as well as defining the role, of American government (Rabin et al. 1989).

## Introduction

The operational "compass" of the United States, the Constitution, has served to guide the direction of several facets of the country's government since its inception in the late eighteenth century. The professional duty of administering and serving the public good is embedded in the Constitution, and the two concepts remain to be intertwined. The Constitution provides the framework and guides the decision-making of those tasked with being a public manager in the United States (Rohr 2002). Federalism depends on the very work of public administrators to be carried out in a manner consistent with the Constitution, but the growth of the United States has presented a few obstacles and identity crises as the years have progressed. While the evolution of the country has reflected a perpetually adaptive direction in many contexts, so too has its working definition and understanding of the relationship between public administration and its inherent oath to the Constitution. In many situations, a universally accepted description serves as the starting point of the endeavor at hand, yet in the matters of public administration, this has proven not to be the case. Constitutional federalism is a term that carries a certain sense of breadth, as it can be understood to encompass entire relationships between citizens, administrators, and clearly governments. The point is not to attempt to be the first to articulate a concise definition of these concepts but to choose instead to trace the steps back across historically substantive explanations in order to answer the question of how they are connected and also to delve into the potentially problematic interpretations of the two. These problems are considered by this entry to be a necessary evil in that they embody the greatness of our system, adaptability, but at times are inconsistent due to their inherent subjective nature.

## Perspectives (and Problems?) of Public Administration

What is public administration? Who are public administrators? Who do they serve, the citizens or the Constitution? All of these valid questions have been asked countless times, and rightfully so, but there still is no answer. From that comes another question, is it a problem that there is no answer? There is no shortage of willing responders to this inquiry, both in terms of the identity of public administration and whether or not it is an actual issue being holistically undefined. The search into what public administration is can often lead to more confusion. The actual study of public administration has been explained by having an identity crisis (Waldo 1968), and this statement certainly carries a degree of truth to it. In his famous essay, Woodrow Wilson offered what is arguably considered to be the first literature authored on the topic of public administration in the United States. While this may be the first work on the topic, he may have also offered the most succinct definition of administration, seeing it as a "detailed and

systematic execution of public law" (Shafritz et al. 1992). This definition assumes that the role of the public administrator is the one responsible for implementation and carrying out the public law. This law has become to be known as the law of the Constitution and is further legitimized by the existence of judicial review. What has set the United States apart from other governments with constitutions is the presence of our judicial system; without it, our Constitution would be just another philosophical list of wishful moralities (May and Ides 2004). It is due to this legal authority that public administrators take an oath to uphold the Constitution in their respective positions. While it is true that those in the legal profession are considered public administrators and servants, that leaves a large gap in the field of administration and serving the public as a whole. The "Constitution (serves) as a standard for civil servants, but it plays a larger role in civil society as well" (Rohr 2002). As the Constitution may serve as more than a professional directive, the concept and field of public administration may similarly reach beyond any specific arena. The Blacksburg Manifesto opines a similar outlook, "professional status is not the answer and exhorts the Public Administrator to employ the metaphors of servants, vocation, and accountable teacher" (Wamsley et al. 1990). The range of definitions, interpretations, and theories of public administration are vast. The tendency for the laity to identify it as politics is also a common, albeit mistaken, idea that has loosely been adopted. It does not share the ease of explanation as its administrative cousin, business, but it does require the attention and attempt to do so anyway.

## Shifts of Federalism Perspectives

Federalism is the long-standing principle of government that embodies the relationship between the various levels of government. In the United States, this is often considered to be the dynamic of the federal government and state or local governments. The constitutional balance between the two levels of governance (Young 2015) continues to be a talking point in the conversation of politics and public administration. The reason for this perpetual discussion is due to the implications of different interpretations of the powers granted to both levels as bestowed by the Constitution. Political history in the United States has mimicked an ebb and flow regarding the administrational control from national to local and vice versa. The argument over what is the proper allotment of authority and clout assumed by the federal and state governments has pervaded the political landscape from day one in our history (Conlan 1998). The twentieth century saw the New Deal usher in a new era of unprecedented control and intervention at the federal level in the form of programmatic liberalism. This practice and view of the administration by the government of programs continued for some time up until the administrations of Presidents Nixon and Reagan. They actively questioned the control of the federal government through the lens of "threats of sweeping social or economic change and a movement toward mass democracy" in the attempt to decentralize government in favor of greater state control (Conlan 1998). What this history of altering assumptions, opinions, and theories offers is a segue into the conversation about interpretation and how it affects both federalism and public administration.

## Interpretation and the Debate over Control

The aforementioned judicial review process is a significant "tool" in the federal government's capacity to exercise its constitutional authority; it can overturn and has overturned decisions made by various state courts. This power to exercise such authority is not infinite, however, and is actually limited by the Article III case or controversy requirement. Under this Article arises the term justiciability, a set of doctrines that define the circumstances needed to be met in order for a federal court to exercise its constitutional authority (May and Ides, Constitutional Law: National Power and Federalism 2004). These limiting doctrines are created from interpretations of the Article. Interpretations are subjective, which leads to the malleable

identity of the constitutional federalism and public administration. This leads to the debate over the amount of discretion these individuals have in interpreting the United States Constitution. Within the purview of constitutional law lie the decisions that underlie the culture behind the contemporary understanding of federalism.

These matters often shape the direction of administration and government. According to Edward Purcell, the early-twenty-first-century ideals of constitutional interpretation were basically split into two philosophies, both of which have influenced United States constitutional law (Purcell 2014). Originalism holds the belief that the Constitution should be understood in the context of the day that it was ratified, while the other movement was in the pursuit of implementing mechanisms in the form of constitutional provisions that were meant to limit the powers of our national government. This "federalist revival" is an effort to "protect the sovereignty of the states", and which combined with originalism (Purcell 2014) as interpretive ideals shape the constitutional argument. As this conversation has continued, the results of various interpretations over time have produced high levels of power on the federal side, as well as the devolution of authority from national to state governments (Koontz 2002).

## Conclusion

What is public administration? Who are public administrators? The two concepts have sense of uniqueness to them in the sense that neither has a universally defined definition and both allow for an enormous amount of interpretation for those in pursuit of trying to create one. There is likely to never be an answer produced with any degree of finality attached to it, and perhaps, there shouldn't be given potential implications of limiting such concepts in the American system. The relationship between the two is undeniable; they are dependent on the other to have a continuing and legitimate purpose in the United States. Taking Rohr's (2002) and Wilson's (1992) views on the topic, public administration might better be described by its association with the power of the state to govern the people, and the Constitution is in place to constrain these powers and mediate the relationship between the two. What complicates matters of both concepts is the varying level of interpretation by public administrators in carrying out their civic duties. While there may be a negative connotation that follows such a statement, it is actually what makes the United States system so special and also why it works.

Yes, there are moments after witnessing slow changes that produces impatience or public unrest, but the fact that there are changes is what the system is designed to allow. The mechanisms in place serve a purpose to guide public administrators and society as a whole, but most of them are made to be able to adapt and evolve. The United States system may share general similarities with others, and our Constitution is not the first and only one, but it is unique in comparison. Aspects such as the constitutional principle of separation of powers are things that have to be taken into account in our country that administrators in others do not (Rohr 2002). The authority given to national and local governments and those who take the oath to administer the public good is open to interpretation, another unique trait of such a system. The very presence of opinions shaping the concept and understanding of the Constitution and federalism is necessary, albeit inconsistent, for the natural pursuit of a punctuated equilibrium. This is meant in the context of having a perpetual discussion over finding the natural balance of power and authority between the varying levels of federal and state governments. This encapsulates the ongoing debate producing eras of one practice or theory to the next that ushers in a period of an opposite ideal with the ambition of achieving a state of stasis. While this status is essentially unachievable in matters such as public administration and federalism, it is nonetheless a driving force behind each new interpretation of either.

# Constitutional Federalism and Public Administration, Russia

Ivan Leksin
Lomonosov Moscow State University, School of Public Administration, Moscow, Russian Federation

## Synonyms

Federation and Public Administration; Federal System and Public Administration

## Introduction: Historical Background

Formally, Russia has been a Federation since January 1918, when the federal character of the Russian Republic was proclaimed by the Declaration of Rights of Laboring and Exploited People, approved by the Third All-Russian Congress of Soviets. Half a year later, this Declaration was incorporated into the first constitution (Basic Law) of the Russian Soviet Federative Socialist Republic. All the Soviet Russian constitutions that followed (of 1925, 1937, and 1978) kept naming Russia the "Soviet Federative Socialist Republic."

Since 1992, Russia's official name is "the Russian Federation." Noteworthy, incorporation of this term into constitutional language occurred following the conclusion of the so-called Federative Treaty (for more details, see below), less than 2 years before the enactment of the current constitution. The term "Russian Federation" had not become a complete novelty for political and legal dictionary, as it had been used for decades before in academic papers (Chistyakov 1966). However, this collocation did not get wide recognition until the early 1990s.

For the members of the Federation, quite an unusual designation is being used since the end of the twentieth century – "subjects of the Federation." This construction does not seem to be perfect, but it has a simple historic explanation. It traces back to the law of the USSR dd. 26 April 1990, "On Distribution of Powers between the USSR and the Subjects of the Federation," that referred both to the Union republics and to the autonomous republics within the Union republics. Thus, the term "subjects of the Federation" served for generalization of heterogeneous entities.

Within Russia such a generalization was considered to be necessary as well. Originally, only autonomous republics (totaling 16, as of 1 January 1990) could be regarded as political entities within the Russian Soviet Federative Socialist Republic. However, upon conclusion of the Federative Treaty in 1992, all the upper-level units (totaling 88) were vested with political autonomy. Consequently, six formal types of constituent units of the Russian Federation appeared instead

of one (see chapter ▶ "Multilevel Governance and Public Administration, Russia").

## Constitutional Layout of Russian Federalism

The Constitution of the Russian Federation sets provisions for the regional and local autonomy and declares distribution of jurisdiction between federal and regional orders of government.

Currently the Russian Federation comprises 22 republics, 9 krays, 46 oblasts, 3 cities of federal significance, 1 autonomous oblast, and 4 autonomous okrugs (see chapter ▶ "Multilevel Governance and Public Administration, Russia"). All the 85 constituent units are proclaimed equal in their relations with the Federation. This neither repudiates political or economic asymmetry of the country nor prevents the regions from having definite legal specifics. For instance, republics enjoy the right to establish their own official languages in addition to Russian and to adopt constitutions, while in the constituent units of other types, similar documents should be titled "statutes." Much more specific is the position of autonomous okrugs that can be parts of either krai or oblast under Art. 66, para. 4, of the Constitutional Court of the Russian Federation. According to the opinion of the Constitutional Court of the Russian Federation, this means that the territory and the population of an autonomous okrug can be simultaneously a part of the territory of another constituent unit (currently three of the four existing autonomous okrugs remain incorporated into oblasts). It follows therefrom that some sort of distribution of jurisdiction between these constituent units should be settled (either by themselves or by federal law). The specifics set in the federal laws are considerable as well (Leksin 2014). However, the rule of constitutional equality of constituent units of the Russian Federation is generally observed (Topornin 2001).

The Constitution mandated that three blocks of jurisdiction should exist: federal jurisdiction, joint jurisdiction of the Federation and its constituent units, and residual powers (for the lists of powers, see chapter ▶ "Multilevel Governance and Public Administration, Russia"). The latter are considered to be exercised by the regional governments. Local governments do not participate in the constitutional distribution of jurisdiction. In fact, their functions overlap all the three mentioned blocks (see chapter ▶ "Institutional Foundations of Local Self-Government, Russia").

The Constitution of the Russian Federation provides for the formation of separate federal and regional governments (see chapters ▶ "Multilevel Governance and Public Administration, Russia" and ▶ "Regional Executives, Russia"). According to Art. 10 of the Constitution, the principle of separation of powers applies to both of these levels. Being grasped in concert with the federal principle, it implies that each constituent unit of the Russian Federation has its own legislative, executive, and judicial bodies. Under the provision of Art. 11, para. 2, of the Constitution of the Russian Federation, the governmental powers in the constituent units of the Russian Federation shall be exercised by the bodies they created. However, legal and political practices correct these declarations significantly.

The grounds for such corrections had been laid by the federal Constitution itself. First, according to Art. 72, para. 1, and Art. 118, para. 3, of the Constitution of the Russian Federation respectfully, general principles of governmental organization shall be set by the ordinary federal law, and the judicial system of the Russian Federation shall be instituted by the federal constitutional law. Art. 77, para. 1, further specifies that constituent units of the Russian Federation shall establish their governmental systems autonomously, though in compliance with the principles of organization of legislative (representative) and executive bodies set by the federal law. Second, under Art. 72, para. 1, and Art. 75, para. 3, of the Constitution of the Russian Federation, common principles of taxation and dues in the Russian Federation shall be established by federal law. This outwardly harmless provision currently serves as a basis for extensive federal legislation on taxation on every level of government. Third, Art. 78, para. 1, of the Constitution of the Russian Federation provides for establishment of territorial offices by the federal executive. In fact, such offices constitute quite

a brachiferous system that operates in parallel with the regional executives (see chapter ▶ "Regional Executives, Russia"). Finally, Art. 124 of the Constitution of the Russian Federation demands that the courts be financed only from the federal budget. This provision obviously conflicts with the idea of the regional autonomy in judicial sphere (see chapters ▶ "Federal Government, Russia" and ▶ "Multilevel Governance and Public Administration, Russia").

## Sovereignty Issue in the Russian Federation

Russian legal and political languages treat the sovereignty issues specifically. This specificity manifests in three main aspects.

First, the notion of sovereignty had been being adopted by the Russian science by stages. In the prerevolutionary years (beginning of the twentieth century), the scholars focused their attention on the essence of territorial sovereignty (e.g., Yaschenko 1912). The scientists that conducted researches in this sphere used to prefer a native equivalent of the word "sovereignty" (the latter had been usually translated into Russian as "territorial supremacy," or "territorial paramountry," making territorial sovereignty consonant with supremacy of law). Creation of the Soviet Union had led to the conceptual disputes on coexistence of the Union sovereignty with the sovereignty of the Union republics. This time a word of German origin ("Souveränität") had become predominantly used. As a result, in Russian translation the collocations "territorial sovereignty" and "state sovereignty" are not relatives.

Second, contemporarily a single term is being used for the sovereignty of the Federation, its constituent units, etc. In each case a collocation "state sovereignty" is being applied (as contrasted to the "people's sovereignty").

Third, in the recent decades, the word "sovereignty" often bears a negative connotation. For decades since the formation of the Soviet Union, the sovereignty issues had not leaved the realm of dogmatic theorization. However, in the early 1990s, the notion of sovereignty took on a highly politicized significance. As the disintegration processes in the Soviet Union and within Russia intensified, discussions on republican sovereignty become associated with secessionist ambitions (Karapetyan 2001).

Over the existence of the Soviet Union, the Union republics had been considered to be sovereign alongside with the sovereign Union. Adjacency of two sovereignties on the same territory gave rise to several theories of republican sovereignty (of a limited sovereignty, of a potential sovereignty, of a latent sovereignty). Autonomous republics within the Union republics were never regarded as sovereign under constitutions of either the USSR or the Union republics, although some scholars argued that autonomous republics possessed features of state sovereignty or a limited state sovereignty. However, shortly after the Congress of People's Deputies of the RSFSR adopted the Declaration of State Sovereignty of the RSFSR on 12 June 1990, autonomous republics (as well as some other of the Russian regions) proclaimed their sovereignty in similar declarations. This movement was called the "parade of sovereignties." Most of autonomous soviet socialist republics took self-names of "Soviet Socialist Republics" (cutting off their autonomous identification). By means of this, these republics intended to become self-standing members of the renovated Soviet Union, alongside with the original Union republics they used to be part of.

Surprisingly, both the Union and the Russian officials were well-disposed to the sovereignty ambitions of the autonomous republics. Being political rivals, USSR government and the government of its largest member, RSFSR, tried to enlist the support of the leaders of the sub-Russian republics, thus contributing to the sweeping disintegration of the Russian Federation.

After the breakup of the USSR, the sovereignty issue within Russia did not lose its acuteness, though substantially changed its form. The federal and regional governments became adversaries. The first tried to contain secessionist movements though had to stay consistent with the proclaimed ideas of democratic decentralization and the right of the national entities to self-determination. On 31 March 1992, a political compromise was

authenticated by signing the Federative Treaty by the representatives of the federal government and of 86 of the 88 then-current regions. This time the republics (former ASSRs) were titled "sovereign republics within the Russian Federation."

However, the Constitution (Basic Law) of the Russian Federation of 1978, as amended following the conclusion of the Federative Treaty, did not call the republics within the Russian Federation sovereign. Neither does the current Constitution of the Russian Federation of 1993.

Contemporary official opinion concerning distribution of state sovereignty in Russia is expressed in several judgments of the Constitutional Court of the Russian Federation:

- Resolution No. 10-P dd. 7 June 2000, on verification of constitutionality of provisions of the Constitution of the Republic of Altai and of the Federal Law "On the General Principles of Organization of Legislative (Representative) and Executive Bodies of Constituent Units of the Russian Federation"
- Ruling No. 92-O dd. 27 June 2000, on inquiry of a group of deputies of the State Duma of the Federal Assembly (the official name of the parliament of the Russian Federation) of the Russian Federation regarding conformity of provisions of the constitutions of the Republic of Adygeya, the Republic of Bashkortostan, the Republic of Ingushetia, the Republic of Komi, the Republic of North Ossetia-Alania, and the Republic of Tatarstan to the Constitution of the Russian Federation
- Ruling No. 249-O dd. 6 December 2001, upon application of the President of the Republic of Bashkortostan regarding official interpretation of the Ruling of the Constitutional Court of the Russian Federation of 19 April 2001 upon application of the Plenipotentiary Representative of the President of the Russian Federation in the Volga Federal District regarding official interpretation of the ruling of the Constitutional Court of the Russian Federation No. 92-O dd. 27 June 2000
- Ruling No. 250-O dd. 6 December 2001, on inquiry of the State Assembly-Kurultay of the Republic of Bashkortostan on interpretation of provisions of Arts. 5, 11, 71, 72, 73, 76, 77, and 78 of the Constitution of the Russian Federation

The reasoning parts of all these judgments (sections 2.1, 2.1, 3.1, and 3.1, respectively) read that "the Constitution of the Russian Federation does not provide for any other bearer of sovereignty and source of power except the multinational people of Russia, and, therefore, does not provide for any other state sovereignty than the sovereignty of the Russian Federation. In view of the Constitution of the Russian Federation its sovereignty excludes coexistence of two levels of sovereign authorities within the single system of government. . . i.e. does not assume the sovereignty of the republics or other constituent units of the Russian Federation to exist."

The considered legal treatment of the Constitutional Court of the Russian Federation, of course, rests on substantial historical and political grounds. After the "parade of sovereignties" in the early 1990s, a formal mention of the sovereignty of constituent units of the Russian Federation is perceived as a threat to its territorial integrity. Given these circumstances, the decision of the Constitutional Court quite naturally had a protective sense, rather than a heuristic one (although, of course, it must be noted that such protection of the Russian statehood was in a greater demand in the 1990s, while in political conditions of the early 2000s, this decision was a reflection of the actual strengthening of general government). We can also assume that a more favorable attitude of the Court to the sovereignty of the republics could have caused an unnecessary political hype.

However, although the Constitutional Court of the Russian Federation, apparently, was guided by good intentions, its reasoning was not perfectly convincing. To some extent it was based on a confusion of the notions of popular and state sovereignty. The Russian Constitution declares unity of sovereignty solely in respect of the popular one, in Art. 3, para. 1: "The holder of sovereignty and the only source of power in the Russian Federation is its multinational people." The Constitutional Court had extrapolated this unity to the state sovereignty, while the constitutional

provisions (e.g., Art. 4, para. 1, according to which "the sovereignty of the Russian Federation shall cover the whole of its territory") do not explicitly read that the word "sovereignty" is inapplicable to the constituent units of the Russian Federation.

Besides, the opinion expressed by the Constitutional Court of the Russian Federation can be described as an unfinished one. Having noted the interlink between state sovereignty and the multinational people of the Russian Federation, the Court had concluded that only the sovereignty of constituent units of the Russian Federation was unsound. However, following the idea of solidness of the national sovereignty expressed in the said decisions of the Constitutional Court, it would be reasonable to declare the absence of neither regional sovereignty nor the sovereignty referring to the general level of government. By implication of the Court's decisions, state sovereignty should be regarded a possession of the Russian state as a whole, but not of the Russian Federation as opposed to its constituent units.

It seems reasonable that the powers of both the federal and regional governments are manifestations of state sovereignty. The federal government and the governments of constituent units of the Russian Federation derive their powers from the same source, which is, under the Constitution of the Russian Federation, the will of the multinational people. When the government of either level exercises its powers, it expresses the sovereign will of the people, while the level of government itself (neither the regions nor the federal government) has no sovereignty.

It should also be noted that rigidity in the use of the term "sovereignty" that the Constitutional Court of the Russian Federation insists on is dissonant with extensive use in the Constitution of the Russian Federation of the noun "state" (which applies to both the nation as a whole and republics within the Russian Federation) and of the adjective "state" (which is attributable to the governmental bodies, to public service, to property not only of the Russian Federation but also of its constituent units (of any type), as well as to official languages of the republics within the Russian Federation). The term "sovereignty" is, of course, overly politicized, and limitation of its acceptable use could serve as a means of reducing political illusions and speculations. However, this tool may not be effective without prohibition on the "state" identification of the republics within the Russian Federation. Such prohibition could be accomplished solely by means of enactment of a new Constitution of the Russian Federation, as the republics are called "states" in Art. 5 of the current Constitution that belongs to the unalterable Chapter 1.

In addition, this restriction does not look quite natural, since according to Art. 73 of the Constitution of the Russian Federation outside the jurisdiction of the Russian Federation and the federal powers within the joint jurisdiction of the Russian Federation and its constituent units, the latter shall possess full state power. This corresponds to one of the acknowledged meanings of the word "sovereignty." An attempt to interpret it this way was made in the Constitution of the Republic of Bashkortostan. Its Art. 1, para. 2, as amended 3 November 2000, had stated that "the sovereignty of the Republic of Bashkortostan is expressed in the possession of full state power (legislative, executive and judicial) outside the jurisdiction of the Russian Federation and the powers of the Russian Federation on issues under joint jurisdiction of the Russian Federation and the Republic of Bashkortostan." Similar provisions had lately appeared in Art. 1, para. 1, of the Constitution of the Republic of Tatarstan and in Art. 1, para. 1, of the Constitution of the Chechen Republic. Following the adoption of the said decision of the Constitutional Court, the term "sovereignty" was replaced in the Constitution of the Republic of Bashkortostan by the word "statehood." However, the constitutions of Tatarstan and of the Chechen Republic still contain provisions mentioning their sovereignty.

The issue of sovereignty of constituent units of the Russian Federation was further associated with the issue of their citizenship. Proceeding from the assertion that republics do not possess sovereignty, the Constitutional Court of the Russian Federation in its ruling No. 250-O dd. 6 December 2001, on inquiry of the State Assembly-Kurultay of the Republic of

Bashkortostan on interpretation of provisions of the Articles 5, 11, 71, 72, 73, 76, 77, and 78 of the Constitution of the Russian Federation, concluded that republican citizenship neither has the right to exist.

Rigidity of the federal Constitutional Court in this question is understandable, as in Russia, the citizenship of the republics had become a subject of political speculations along with the issue of their sovereignty. The Federal Law No. 62-FZ, dd. 31 May 2002, "On the Citizenship of the Russian Federation," could serve the ground for a more tactful solution of the problem of citizenship of constituent units of the Russian Federation, as compared with the judgment of the Constitutional Court of the Russian Federation. According to Art. 71, para. "b," of the Russian Constitution, issues of citizenship in the Russian Federation fall to the jurisdiction of the Russian Federation. This leaves the legal possibility of recognition of the citizenship of republics within the Russian Federation, but solely at the discretion of the federal legislator, as following the provisions of Art. 76 of the Constitution of the Russian Federation, constituent units of the Russian Federation cannot make laws on the issues listed in Art. 71. The named Federal Law does not refer to citizenship of the republics, and consequently, this phenomenon in the legal sense does not currently exist (which does not prevent its rebirth in the future).

At the moment, only the Constitution of the Republic of Tatarstan mentions the republican citizenship, in Art. 21. According to the latter, citizen of the Russian Federation permanently residing in the Republic of Tatarstan is simultaneously a citizen of the Republic of Tatarstan. Up until 2010, Art. 4 of the Constitution of the Republic of Tyva contained a similar provision.

## Means of Distribution of Powers Between Orders of Government

Being a federal country by its official designation, Russia requires a constitutional distribution of powers between orders of government. A sort of such distribution can be found in Arts. 71–73 of the Constitution of the Russian Federation (see chapter ▶ "Multilevel Governance and Public Administration, Russia"). However, despite existence of the constitutional lists of powers, the Constitution of the Russian Federation cannot be regarded as a full-fledged source of the said distribution.

First, the constitutional formulas are not very precise and thus are subject to various interpretations. Due to the poor specificity of the Russian Constitution and other errors (duplicated articles of exclusive jurisdiction of the Russian Federation and joint jurisdiction, lack of a universal approach to settling the powers, etc.), it inevitably shares its function of distribution of competence with other legal sources.

Second, the Russian Constitution proclaims the vast part of jurisdiction to be the common field of the Russian Federation and of its constituent units. By virtue of the fact that the Constitution assigns the majority of socially significant issues, which affect the everyday interests of all citizens and organizations, to joint jurisdiction of national and regional levels of government, it is impossible to judge the actual level of centralization (decentralization) of Russia, being guided by the constitutional provisions solely.

Allocation of the powers within this sphere had always been a disputable issue. Though the constitutional distribution of powers between orders of government remains stable for more than two decades, actual autonomy of the regions changed drastically during this time due to the other legal sources. The Constitution of the Russian Constitution stipulates in Art. 11, para. 3, that distribution of powers between the federal government and the governments of constituent units of the Russian Federation shall be set only "by the given Constitution, the Federative Treaty, and other treaties." The first years after adoption of the Constitution of the Russian Constitution of 1993 were marked with "treaty making." In 1994–1998 such treaties, provided for by the Constitution (abovementioned Art. 11, para. 3), were signed by the representatives of 46 regions. All of them contained more or less corrected lists of federal and "joint" powers and one way or another violated the Constitution and (or) the federal laws.

Actually, one may doubt if these documents could have legal significance at all. They passed a ridiculous procedure: being just signed by the federal and regional leaders, these treaties claimed to be a substitute for the constitutional provisions on distribution of powers for the respective regions. Most of these treaties were denounced by agreements of their parties in 2001–2003. For the others a transitory provision had been set requiring passing a new procedure stipulated for in the Federal Law No. 184-FZ dd. 6 October 1999, "On the General Principles of Organization of Legislative (Representative) and Executive Bodies of Constituent Units of the Russian Federation." This procedure assumed ratification of a treaty by adopting a special federal law. Thus, none of the remaining treaties had chances to be prolonged. Consequently, all these treaties had been pronounced invalid in 2005. Lately, in 2007 a new treaty with the government of the Tatarstan Republic passed the said newly developed procedure. However, it appeared to be rather a symbolic document for the Republic than a treaty on division of powers (actually this treaty does not contain any significant provisions). Since then, no treaties of this type were concluded.

In the course of recomposing distribution of powers, it was definitely the Constitutional Court of the Russian Federation that ensured drastic strengthening of the federal positions. In dozens of decisions, the Court supported federal legislation, thus fighting the mentioned quasifeudal disunity and providing for developing a uniform regulation in various spheres, from electoral system to fire safety. One of the first adjudications of that kind (and the one that had far-reaching implications) was Resolution No. 1-P dd. 9 January 1998, on verification of constitutionality of the Forestry Code of the Russian Federation. By this Resolution the Constitutional Court of the Russian Federation provided for expansion of the list of acceptable forms of distribution of powers. According to para. 4 of the rationale of this decision, the Federal Law "defines the rights and obligations of the parties involved, including the powers assigned to the levels of government, and thus sets the distribution of these powers," and therefore, the Federal Assembly "shall be entitled to exercise the legislative regulation of issues related to the given articles of joint jurisdiction, to determine appropriate specific powers and competence" of governments of the Russian Federation and its constituent units.

This decision opened the gates to the federal legislative expansion. Shortly thereafter the Tax Code was successfully passed by the federal parliament. By adopting this act, the Federation proclaimed the most important taxes to be federal and set a comprehensive list of regional and local taxes. The federal government accumulates most financial resources and then redistributes them back to the regions. Considering enormous disproportions in regional economies, this measure was reasonable. However, it obviously provided the federal government with an outstanding leverage over regional governments.

One year later, the mentioned Federal Law "On the General Principles of Organization of Legislative (Representative) and Executive Bodies of Constituent Units of the Russian Federation" was enacted. With numerous amendments that followed, this act moved further and further from being a law "on the general principles." Its contemporary version contains detailed provisions on procedures of formation of regional legislative and executive bodies, on the structure of regional legislature, on procedures of decision-making, on regional taxation and budgeting, on federal intervention measures, on distribution of powers between federal and regional governments, and so forth. Thus, this Federal Law de facto took on part of the role of the constitution for all regions of Russia, whereas the latter have no choice but to reproduce provisions, established by the said law, in their constitutional acts (see chapters ▶ "Multilevel Governance and Public Administration, Russia" and ▶ "Regional Executives, Russia").

Currently, it is this law that serves as the main instrument for distributing powers within the vast field of joint jurisdiction of national and regional levels of government. Since 2003, it contains a list of powers lying within joint jurisdiction of the Russian Federation and its constituent units that the regional governments are responsible to exercise using their budgetary funds. This extensive list has been being regularly broadened by the

federal legislator (as of today, it includes some 110 blocks of powers). These powers refer to:

- Agricultural lands, support of agricultural production
- Some of the mining operations
- Development of small-scale and medium-scale business, inter-municipal investment projects, regional R&D, innovation programs and projects, pricing policy, intraregional trade
- Foreign economic agreements of the regional government, frontier cooperation
- Regional territorial planning, supervision over capital construction
- Housing issues, heat supply, water supply and sewerage, potable water and household water supplies
- Orphan children, guardianship and trusteeship, support for charitable activities and volunteering
- Regional highways, transportation services to the population, regional airports and aerodromes, river ports
- Preschool; primary, basic, and secondary education; physical culture and sports
- Historical and cultural monuments, regional museums, public libraries, support for arts and cultural development, as well as tourism development
- Employment assistance, labor protection, settlement of collective labor disputes
- Medical care, social support, and social services to advanced-age and handicapped citizens
- Assistance for burials
- Veterinary supervision
- Fire prevention and firefighting; prevention of emergency situations and of natural calamities and epidemics; and liquidation of the aftermath thereof, emergency rescuing
- Protecting natural environment and ecological security
- Administrative sanctions for violation of regional laws

Aside from the powers relating to the listed issues, the regional governments are mandated by special federal laws to exercise extra powers, at the expense of the federal budget. Thus, in the last decade, the distribution of powers between the federal and regional governments is being transformed neither by amendments to the Constitution of the Russian Federation nor by means of intergovernmental treaties (although agreements on delegation of administrative powers have been being regularly concluded between the federal governmental and regional executives), but by ordinary federal legislation, which does not require the adopted acts to be ratified by the representative bodies of constituent units of the Russian Federation.

As far as the federal laws became the main instruments of redistributing powers between orders of government, stability of the limits of jurisdiction of the constituent units of the Russian Federation is not guaranteed. However, the actual distribution of powers has reached a somewhat balanced condition, as the federal legislator had already covered almost all the issues he intended to.

## Federalism and the Federal Executive

The system of federal governing institutions is not restricted to the Russia's capital. Quite few of the bodies within the federal executive reside solely in Moscow. The main of such few bodies is the council of ministers (officially titled the Government of the Russian Federation). Under provisions of the Russian Constitution, the composition of this collegial body does not reflect the federal structure of Russia. However, according to Art. 6 of the Federal Constitutional Law No. 2-FKZ dd. 17 December 1997, "On the Government of the Russian Federation," deputy chairmen of the Government of the Russian Federation and federal ministers may hold the posts of plenipotentiary representatives of the president of the Russian Federation in the federal districts. Currently, there is one member of that kind within that body (see chapter ► "Federal Government, Russia").

The Constitution of the Russian Federation does not provide for direct involvement of the Government of the Russian Federation into

intergovernmental relations. However, under the Constitution, the decision of the government is mandatory in the Russian Federation (Art. 115, para. 2). Besides, Art. 77, para. 2, of the Constitution stipulates that within jurisdiction of the Russian Federation and the powers of the Russian Federation on the issues under joint jurisdiction of the Russian Federation and the constituent units of the Russian Federation, federal and regional executive bodies shall make up a united executive system. The meaning of the constitutional notion of this single executive is quite ambiguous, given the federal system of Russia. Whatsoever, taken together the two cited constitutional clauses allow the Government of the Russian Federation to establish the rules that are mandatory for the regional executives and, sometimes, to give them instructions.

Further, the Government of the Russian Federation actually participates in intergovernmental relations under the Federal Law "On the General Principles of Organization of Legislative (Representative) and Executive Bodies of Constituent Units of the Russian Federation." According to Art. 26.8 of the latter, it sets the rules for concluding agreements between federal and regional executive bodies on delegation of certain powers and approves such agreements.

Finally, the Government of the Russian Federation is, unexpectedly, involved in revising division of the federal territory into constituent units. Art. 147.2, para. 1, of the rules of the Council of the Federation (i.e., the upper chamber of the Federal Assembly) requires that the federal government submits its consent in cases of changing the boundaries of the cities of federal significance. For instance, the Resolution of the Council of the Federation No. 490-SF dd. 16 December 2009, on approval of changing the boundaries of the city of Saint Petersburg, had been adopted relying on the suggestion of the Government of the Russian Federation formulated in its ruling No. 1707-r, dd. 13 November 2009.

As mentioned above, federal executive bodies are entitled by the Constitution of the Russian Federation to establish territorial offices. Actually, most of the federal ministries, services, and agencies (see chapter ▶ "Federal Government, Russia") have numerous territorial departments. The idea to decrease federal presence in the regions has been being ventilated through the past two decades. However, despite the officially declared intentions to balance the number of federal institutions and officials in the constituent units of the Russian Federation with the federal principle, this transition is going slowly.

The administration of the President of the Russian Federation, that is, formally a non-governing institution, but actually the central unit of the public administration system, is not a single central office of the head of the Russian state as well. Actually, it is a hierarchical network of regional and supraregional departments and officials (see chapter ▶ "Head of the State and Public Administration, Russia").

## The Role of Constituent Units of the Russian Federation in Public Administration

The regional executives occupy a dualistic position in the system of public administration. On the one hand, they remain significantly dependent on the Russia's federal government in political, administrative, and financial respects (see chapter ▶ "Regional Executives, Russia"). Though restitution of popular elections of the regional chief executives in 2012 was an important formal step towards decentralization, the preceding period of quasi-appointment of these officials had been long enough to replace popularly elected governors with the presidential designees, which were usually concordant with the federal policies and were not eager to assert regional autonomy. Given that the Russian society actually has no intense aspiration for federalism, this cutting regional autonomy down in 2005–2012 actually does not deserve a rigorous denunciation. It resolved some pressing issues, such as populism at regional electoral campaigns and popular disenchantment after elections. Therefore, in some way, it was waited for by the voters. And it turned out to be quite convenient for the so-called regional elites. These did not only benefit from the vanishment of electoral battles but also managed to receive a

huge rent from the fact of siding with the federal authorities (Leksin 2012). Popular elections of the regional chief executives should contribute to political independence of the latter but does not guarantee it, of course. However, that may be, the chief officials of the constituent units of the Russian Federation and regional executives as a whole remain substantially involved in the federal policies.

On the other hand, it is the regional executives that the operability of the Russian government actually depends on. They carry the larger part of the administrative burden, as they act as the main implementors of both federal and regional legislation (see chapter ▶ "Regional Executives, Russia").

## Conclusions

Federalism and public administration in Russia had been developing in a somewhat unusual symbiosis. Although the federal principle is an obvious obstacle to constructing an integral system of public administration, in the Russian Federation, it had been used in antithetical ways.

In the revolutionary years at the beginning of the twentieth century, the federal idea had been being exploited in order to contain separatism driven by the nationalist aspirations in different parts of the ruined Russian Empire. In fact, the terms "federation" and "federative" had been being mainly misused at that time, describing political system based on ethnic autonomy, as a rule. Though this misuse was quite common during that time, it profited the Soviet government, first of all. In less than a decade after the end of the civil war, the Soviet state became solid in both political and administrative respects, although formally it remained a federal system.

At the end of the Soviet period of Russian history, the decentralistic movement in the Russian regions had been developed under the federalism slogans as well. Again, the terminology being used in political rhetoric during that period had little to do with the conception of federalism. Actually, some regional elites had strived for political autonomy and financial self-standing, but not for the Federation at all. The rush for more freedom and self-government in the end of the 1980s through the mid-1990s was in many respects stimulated by economic problems, which were exaggeratedly attributed to centralization of the Soviet rule. However, the original expectancies to cope with economic distress by means of decentralization had been ruined with time. Consequently, social support for autonomy had gradually vanished in most of the regions (by the end of the 1990s).

Conclusion of the Federative Treaty in 1992 and adoption of the Constitution of the Russian Federation in 1993 was actually the first time the federal idea had been implemented closely enough to the conventional concept. However, as before, the general government had utilitarian motivation to use it – this time, in order to lessen the political weight of the republics and of the so-called national elites of these constituent entities, as well as to cut down their influence on the federal decision-making. New constituent entities of the Russian Federation (krays, oblasts, cities of federal significance, autonomous areas) served as a political counterpoise to the republics. The new constituent entities provided considerable support to centralist bills in the upper chamber of the Federal Assembly. Thus, the promotion of former administrative territories to the status of constituent entities of the Russian Federation by the Federative Treaty of 1992, combined with regional equality in the upper chamber of the Federal Assembly provided by the Constitution of the Russian Federation of 1993 (formerly, constituent units were represented differently in the upper chamber of the federal parliament: each republic had three delegates, autonomous oblasts and autonomous okrugs were represented by one deputy each, and the other regions had 63 representatives altogether), formed the ground for the posterior centralization. No country has ever shown a more paradoxical example of decentralizing policy. Granting autonomy to the Russian regions that had never been in great need for it eventually permitted to centralize the federal system to such an extent that even republics were deprived of autonomy they used to enjoy. The Russian federalism of the end of the twentieth

century was undermined at its origination, and resultantly it self-destructed in the beginning of the twenty-first century.

Despite the extensive criticism, contemporary federal arrangements should not be regarded as defective. Centralistic nature of the present-day Russia does not cause popular discontent and thus does not demand urgent corrections. For Russia federalism is not an indisputable principle, as for Germany, the USA, or Switzerland, but a doubtful value. Today most of the Russians appear to remain quite indifferent about federalism and regional autonomy.

However, the demand for this autonomy varies greatly in different constituent entities of the Russian Federation. A considerable portion of constituent entities of the Russian Federation had enjoyed autonomy for many decades and cannot be deprived of it painlessly. Thus, legal instruments providing for political autonomy of the Russian regions should not be considered to be useless.

On the whole, by the actual political and legal context, it is not a fairly federal state. It should rather be placed among regional states (along with Spain and Italy). This deflection of the actual political structure from the declared one is neither harmful nor perilous by itself, as the official designation of any state is not legally binding. The terms "federation" and "federal" are abstract notions with no legal definitions. Therefore, constitutional name of the Russian Federation does not oblige it to be a federal state, as neither the Swiss Confederation nor the USA ought to be confederal. However, the Constitution does not only declare Russia to be a federal state but, surely, establishes provisions for certain federal arrangements that cannot be evaded. In this respect, Russia remains quite centralized both politically and administratively.

# Constitutional Intersection of Civil Liberty and Public Administration

Beth Cate
School of Public and Environmental Affairs, Indiana University, Bloomington, IN, USA

## Synonyms

Civil rights; Constitutional law; Public law

## Definition

The constitutional intersection of civil liberty and public administration refers to the need for public administrators to act in ways that do not violate individual liberties protected by a constitution, which is the fundamental charter for government.

## Introduction

Public administrators act under authority granted directly or indirectly through constitutions, which are the fundamental charters for government. Constitutions typically contain provisions that limit government's ability to interfere with certain individual liberties. Public administrators must adhere to these limits while carrying out their duties or face exposure to litigation and liability. This entry briefly describes the main tensions that public administrators in America face when balancing the efficient and effective implementation of public programs, with respect for individual liberty under the US Constitution. This entry does not address state constitutional rights or the many statutory rights that individuals also enjoy and that often provide more extensive, if legislatively revocable, protections for individual liberty.

## Balancing Liberty and Administrative Values

"Civil liberty" is defined as "the political freedom that is enjoyed by members of society that restrains its people as far as is necessary to maintain the general welfare of everyone" (Black's Law Dictionary). This definition embodies a central challenge confronting public administrators in America, who are generally called on to preserve as much individual liberty as possible in the course of carrying out programs aimed at achieving the public good.

The specific individual rights and freedoms that administrators at the federal, state, and local levels must respect are set out in the US Constitution's Bill of Rights and the Fourteenth Amendment. The Tenth Amendment, which reserves to the states or the people all powers not given to the federal government or prohibited to the states, is also noteworthy; it embodies principles of federalism that are felt to maximize individual liberty by preventing concentration of power and preserving more accountable, local forms of government.

The provisions that have been used most frequently to challenge public programs and administrative actions are discussed below. Written in broad language, these provisions gain ultimate meaning through interpretation and application by courts, especially the US Supreme Court, in the context of concrete disputes. Courts recognize that no individual's rights are absolute – that every time one person acts in the enjoyment of her rights, she affects others – and therefore government may, in the exercise of its constitutional power to promote the general welfare, act in ways that necessarily and legitimately cabin individual rights to some degree. At the same time, courts have emphasized that because the Constitution is the "supreme law of the land," core administrative values of efficiency and effectiveness must sometimes yield to the higher constitutional principles (Rosenbloom et al.).

## Frameworks for Judging the Constitutionality of Public Administrative Action

### Freedom of Speech and Expression

The First Amendment says the government "shall make no law abridging the freedom of speech. . .." This reflects the view of the founding fathers – the key figures who crafted the American Revolution and the constitutional republic that followed – that the free flow of facts and ideas is vital to informed self-governance and to checking abuse of power. Accordingly, courts view government efforts to suppress speech or to skew the public debate with deep suspicion. Regulation of speech based on the speaker's topic, or viewpoint, will nearly always be swiftly invalidated unless the government can show that the regulation is narrowly tailored to serve a compelling interest. This test is known as "strict scrutiny," and regulation virtually always fails it. The Supreme Court has applied this test to protect political speech by corporations as well as individuals.

The freedom to speak includes the freedom not to speak, and courts are hostile when government tries to compel someone to adopt its message as her own. So, for example, public schoolchildren may not be made to participate in patriotic exercises like saluting or pledging allegiance to the American flag. In the context of commercial

speech – speech proposing or facilitating a commercial transaction – regulation may require companies to disclose truthful factual information about their products, as long as the regulation is narrowly tailored to directly and materially advance a substantial government interest. Regulation may not, however, require disclosures of information that is ideological as opposed to factual, or reasonably disputed as a factual matter, or effectively convert the manufacturer's packaging and marketing to the government's use for its own messaging. So, while tobacco companies can be compelled to include textual warnings like "Cigarettes Cause Fatal Lung Disease" on cigarette packages, they may not be required to include graphic images of, say, diseased lungs or corpses, or to carry the phone number for the government's smoking cessation hotline.

Free-speech rights extend some protection to expressive conduct or "symbolic speech," such as burning the American flag to protest government policy. Since conduct may cause substantial physical harm, however, government may restrict it to serve important government interests unrelated to suppressing speech, as long as it prohibits no more speech than necessary. Under this principle, the Supreme Court upheld a criminal conviction of a man who burned his draft card to protest the Vietnam War, citing the government's compelling interest in preserving the draft cards as records of eligibility for military service, and the unintended and incidental nature of any burden on the speaker's message.

When people speak in a place reserved for public speech either by long-standing tradition (a park or sidewalk corner) or by conscious government action (a civic building whose rooms are available for use by all comers), the government may not restrict the topics discussed or the viewpoints expressed, although it may impose restrictions on the "time, place, and manner" of speech in these venues to preserve order –, for example, prohibiting the use of a bullhorn in residential neighborhoods late at night. Not all government property is or must be open to all speech; the government may create limited or nonpublic forums in which it may specify the topics (although not the viewpoints) that may be addressed.

When the government is the speaker, it may control its own message. In some cases, however, it may be difficult to tell when the government is speaking and when it is creating a forum for private parties to speak. Consider specialty license plates for vehicles, a program often used by states to raise revenue and facilitate charitable donations to organizations that design the plates. Recently the Supreme Court held that such plates are government speech, since while the designs come from private organizations, the plates still carry numbers and other data used for administrative purposes. Accordingly, the government may reject designs it finds offensive or expects will generate controversy and criticism. Had the Court held that the plates were forum for speech by either the organization that designed it or the vehicle owner who placed it on his car, the government could not pick and choose among designs (in that specific case, it could not reject a highly controversial plate design containing the Confederate flag, which is widely associated with slavery and racism). In such a case, the government might well have decided to forego the program to avoid the costs and headache of responding to provocative plate designs.

The Supreme Court has held that a very few categories of speech which were historically banned, due to their tendency to inflict great harm without contributing much of value to the public debate, remain outside the protection of the First Amendment. These include incitement (speech that is intended and likely to provoke imminent violence, such as whipping up a crowd to riot), "fighting words" (insults that tend to provoke an immediate violence response or breach of the peace – essentially one-on-one incitement), and true threats (an expression of a serious intent to inflict harm on someone and that is reasonably likely to place someone in fear of harm). Public officials struggle with how to apply these categories, and free speech principles generally, to digital age activities like online radicalization, terrorist recruitment, cyberbullying, "revenge porn," and so on. Drawing a workable conceptual line between protected speech and actionable incitement or harassment has proven difficult, even before factoring in the

complexities of enforcement in a globally connected world.

Outside its treatment of these "unprotected" categories, the Supreme Court has firmly resisted calls to judge the constitutionality of speech regulation through an ad hoc balancing test that weighs the social value of the speech against the harms it creates. As a result, most speech, including racial epithets, grotesquely violent imagery, and most adult sexual imagery, gets robust protection against efforts to suppress or punish it. Courts have emphasized that free speech rights would matter little if they only protected the right to express noncontroversial ideas. Courts generally call for more, not less, speech – for "counterspeech" – as the antidote to hateful expression. Essentially, the First Amendment presupposes and demands a public that is willing to engage in robust debate and confront unpopular statements. Yet in some cases, such as revenge porn, the normal calls for counterspeech seem unworkable. Likewise, the usual preference for punishing speech after the fact rather than imposing "prior restraints" may not work well with globally based online radicalization efforts.

### Equal Protection Under Law

The Fifth and Fourteenth Amendments state that government does not deny any person equal protection of the laws. This means it must treat similarly situated persons the same; more precisely, it means that when government classifies people in the course of making and implementing laws, it must have a sufficient justification for the classification. Many classifications involve characteristics like age, residency, income level, and so on that are commonly accepted as appropriate – for example, limiting the ability to drive to persons above a certain age. Such classifications are valid as long as they are rationally related to a legitimate government interest.

In contrast, distinctions in the law based on characteristics that are considered immutable and irrelevant to economic and societal participation, and have been historically misused to inflict great harm on minorities, require greater justification and more limited use. Accordingly, classifications based on race, ethnicity (as distinct from immigration status), and religion must be narrowly tailored to serve a compelling interest. Even efforts to use race to benefit historically disadvantaged minorities will receive this "strict scrutiny" by courts and almost always will be struck down. One of the few remaining constitutional uses of race in government decisionmaking is the use of race by public universities as part of a multifactor, holistic admission assessment designed to achieve the educational benefits of diversity.

Historically, gender-based classifications have received "intermediate" scrutiny, requiring the government to show that gender is substantially related to an important government interest. This use of less-than-strict scrutiny reflects the historical notion that biological differences justified certain differences in legal treatment of men and women; in an age of female Marines, this seems harder to justify. Courts have differed as to whether classifications based on sexual orientation (and perhaps gender identity) also warrant intermediate scrutiny. Since the Supreme Court has held that same-sex marriage bans violate equal protection principles, however, it is difficult to see how distinctions based on sexual orientation in areas like employment would survive constitutional challenge.

### Procedural Due Process

The Fifth and Fourteenth Amendments prohibit the government from depriving someone of life, liberty, or property without due process of law. The guarantee of due process has both procedural and substantive dimensions. Procedurally, it requires government to provide a fair process when taking someone's life, liberty, or property; a criminal trial, with appointed counsel for indigent defendants, is a well-known example. The procedural due process requirement grew in significance as courts in the 1970s began to recast government benefits, resources, contracts, licenses, and jobs – upon which people increasingly depended as major sources of income and support – as "new property" rather than largess (Reich, 741–746). Once an independent source of law, such as a statute, creates an entitlement to continued access to a benefit or work – for example, by preventing termination of

a public employee except for a good cause – the government must use a fair set of procedures in taking that property away. What is fair varies with the circumstances; courts balance the impact on individual interests with the likelihood that requiring certain types of procedures will lower the risk of error in the government's decision and the cost and burden of adding further procedures. The core of procedural due process is a notice of the government's intended action and a meaningful opportunity for rebuttal before an impartial decisionmaker who will make a decision supported by substantial evidence. In some cases – such as when the government proposes to cancel someone's welfare benefits, on which her life may depend – the balance of interests favors the individual and a hearing must take place before the government may act. In other cases, for instance where decisions about disability benefits may be made reliably on a paper record and the benefits are not as critical a form of income, the hearing may come after termination.

The substantive component of due process requires that the government act in a fair and nonarbitrary way and with sufficient justification when it interferes with fundamental individual liberties. This means, for example, that it may never act from an improper motive, such as animus toward a disfavored group. The substantive due process clause is only invoked to protect those individual liberties that are considered fundamental but are not, like free speech, spelled out directly in the Bill of Rights. Implied fundamental liberties protected by substantive due process must be "deeply rooted in the Nation's traditions" or "implicit in the concept of ordered liberty." (Palko 1937).

In the late nineteenth and early twentieth century, courts struck down various progressive labor and economic regulations for violating owners' and workers' fundamental liberty of contract. Those efforts subsided in the 1930s, and courts have since upheld economic regulation so long as it is rationally related to a legitimate government interest. In contrast, the Supreme Court has continued to recognize fundamental liberty interests in making decisions about family, procreation, and sexual intimacy, without unwarranted government intrusion. As a result, it has demanded the government show heightened justification for laws regulating abortion, criminalizing gay sex, and banning same-sex and interracial marriage. Finding insufficient justification for the laws on sex and marriage, the Court has struck them down. Crediting the government's strong interests in protecting the potentiality of life and the health of pregnant women, however, the Court has upheld regulations that do not impose an "undue burden" on access to abortion before viability of the fetus (ability to survive outside the womb) and a ban on abortion after viability. The Court recently made clear, however, that it will weigh the burden a rule imposes against how much it actually serves the stated government interest behind it, and the Court will not accept a legislature's assertions that the rule promotes women's health, at face value.

### Taking Private Property for Public Use

The Fifth Amendment's "takings clause" says that the government may not take private property for public use, without just compensation. The government may constitutionally force the transfer of private property for use in public projects as long as it pays a fair price – typically, fair market value. Both permanent and temporary takings of real property (land and buildings) require compensation, and so does the taking of personal property.

The classic examples are taking privately owned land to build airports or highways that will be used by the public. More controversial has been the taking of property from uncooperative property owners as part of a scheme to redevelop an economically depressed area, unless that area is "blighted" (afflicted with severe decay and unsafe living conditions). Taking private property for economic redevelopment, particularly if the government gives the property to private developers that are partnering with it to carry out the project, has led – property owners to claim that the project is not fir "public use" but rather just transfers property from one private owner to another. A highly controversial 2006 decision by the Supreme Court rejected that claim and held that a city's comprehensive

redevelopment plan to boost the local economy qualified as a public use. Numerous state legislatures responded by passing laws imposing limits on the use of the takings power, citing the critical role that private property rights play in securing liberty and checking government abuse of power.

Government generally may regulate the uses of private property to ensure the common welfare – for example, through zoning and nuisance laws – without implicating the takings clause. The Supreme Court has held however that if a regulation "goes too far" and deprives the owner of most or all of the beneficial use of her property or interferes with reasonable investment-backed expectations, the regulation will be deemed a taking and the government must compensate the owner. Determining whether a regulatory taking has occurred is a difficult ad hoc analysis; the availability of such a claim has empowered challenges to numerous environmental and other regulations.

## Freedom from Unreasonable Searches and Seizures

The Fourth Amendment states that "[t]he right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated ...." A "search" or "seizure" occurs when the government invades or takes something in which a person has an objectively reasonable expectation of privacy – that is, an expectation of privacy that society generally shares. For a search or seizure to be lawful, the government must either get a warrant or demonstrate that requiring a warrant is not feasible and the search is otherwise reasonable in the circumstances. A warrant is a judicial order authorizing the search or seizure after concluding that the government's evidence already gathered offers "probable cause" to believe the thing searched or seized will produce evidence of lawbreaking. A warrant is considered the "gold standard" of privacy protection since it involves oversight by a separate branch of government. Warrants are not always feasible though, and so courts have recognized many exceptions to the warrant requirement over the years, such as allowing the police to conduct limited "stop-and-frisk" activities to check someone they encounter for weapons or other evidence of crime when they have reasonable and individualized suspicion that s/he has committed, is committing, or is about to commit a crime. The Supreme Court has also held that public employers need not get a warrant for the same types of searches of employees or their materials that private employers engage in, to investigate workplace misconduct or for non-investigatory purposes.

Applying the Fourth Amendment in the digital age is challenging, and the Supreme Court has strongly suggested that Congress should update legislation surrounding access to digital records in order to strike the right balance between law enforcement needs and privacy concerns. Meanwhile, from a constitutional standpoint, widespread use of technologies like social media, drones, and traffic cameras may diminish individual expectations of privacy, which in turn may expand the government's ability to monitor and surveil – without a reasonable expectation of privacy, no "search" implicating the Fourth Amendment occurs. Yet, the Supreme Court has expressed unease about long-term digital monitoring of public movements, which can paint a detailed picture of someone's life. And the Court has held that, while an arrest may permit the immediate seizure of a smartphone on someone's person to prevent the destruction of evidence, it does not permit a warrantless search through the contents of that phone, given the tremendous amount of personal information it is likely to contain. This suggests that the Court may also soon abandon a warrant exception it formulated in the 1970s known as the "third party doctrine," in which it held, in the context of two cases involving government access to phone call and banking records, that individuals have no reasonable expectation of privacy in data voluntarily given to a third party. Given that people today routinely conduct highly personal matters, and indeed most of their lives, using third-party services that store data in the cloud, it is hard to imagine the "third party doctrine" will survive much longer.

### Free Exercise of Religion and Freedom from Establishment of Religion

The First Amendment prohibits the government from making any law "respecting an establishment of religion" or "prohibiting the free exercise thereof." Perhaps no area of constitutional law is more fraught than judicial efforts to apply and reconcile these clauses. Efforts to accommodate free exercise rights and avoid religion-based discrimination by letting religious organizations participate in secular public programs (e.g., school vouchers or public contracts for social services) generate claims that the government is establishing religion by supporting it with (fungible) taxpayer dollars. Courts generally have rejected these claims; even when parents use the vast majority of taxpayer-funded vouchers at sectarian institutions, courts have held that the parents' intervening choice of school eliminates any establishment clause concern. When confronting other establishment clause challenges, courts have approved practices that existed at the time the First Amendment was drafted that do not coerce unwilling participants and that do not convey to the reasonable person the message that the government endorses one faith over another or belief over nonbelief (or vice versa). Accordingly, courts have allowed opening legislative sessions with a sectarian prayer, at least if all faiths and nonbelievers have the opportunity to participate. Courts have also approved prayer at public university graduation ceremonies but disapproved it for younger children, presuming greater susceptibility to peer pressure and coercion in the latter case.

Courts have struggled the most with religious displays, judging them case by case to decide whether they convey a sense of government endorsement. Government displays that join the Decalogue (the Ten Commandments of the Old Testament) with other objects to illustrate the historical development of American law have passed constitutional muster. So too have holiday displays, whether taxpayer funded or hosted on public property, that are more secular than religious (more Santa than Jesus). This is typically of small comfort to public administrators, who may have to field complaints that making a display too secular, or opening it to all faiths and to nonbelievers, dilutes the message and does not honor America's Christian heritage and values.

Recent years have seen a growth in demands by individuals and organizations to be exempted from laws of general applicability, on the grounds that compliance substantially burdens the claimant's free exercise of religion. The Supreme Court held over 25 years ago that the free exercise clause does not require carving out exemptions from laws of general applicability that do not target religion and are rationally related to a legitimate government interest. Essentially, some incidental burden on one's religious exercise is the constitutional price paid for living in a pluralistic society.

To hold otherwise, the Court reasoned, would open the floodgates to religious exemption claims from laws people disliked. Swiftly following this decision, Congress and several state legislatures enacted legislation requiring government to exempt religious objectors from compliance with general laws, unless the government could show that requiring compliance was the least restrictive means of serving a compelling interest. Called "Religious Freedom Restoration Acts," these laws have prompted several high-profile actions to force changes in health-care administration and the certification of same-sex marriages.

### The Right to Keep and Bear Arms

The Second Amendment states that "[a] well regulated Militia, being necessary to the security of a free State, the right of the people to keep and bear Arms, shall not be infringed." In a pair of decisions issued in 2008 and 2010, the Supreme Court held that this provision protects individual rights to keep and bear arms for purposes unrelated to military service, like self-defense, hunting, and target shooting, and struck down laws that prevented someone from having a loaded and ready-to-use handgun and shotgun in the home. The Court said that some historical limits on weapons – such as laws barring felons or those with mental illness from accessing guns, banning guns from sensitive areas like schools and government buildings, banning the use of "those weapons not typically possessed by law-abiding citizens for lawful purposes" – will continue to be valid. It refrained

however from offering a standard to use in judging the constitutionality of other rules. This leaves for resolution on a case-by-case basis such issues as whether a legislature may ban assault weapons or 3D-printed weapons or limit the amount of ammunition an individual may purchase; whether it may require background checks, mandatory registration, and training; and whether it may limit concealed and open carry in public. To obtain rulings on these issues, advocacy groups have filed extensive litigation challenging local, state, and federal gun control laws, even as a series of mass shootings has prompted calls from some quarters for more stringent controls.

### Cruel and Unusual Punishment

The Eighth Amendment prohibits the infliction of "cruel and unusual punishments." Courts judge whether a given punishment is cruel and unusual based on the "evolving standards of decency that mark the progress of a maturing society" (Trop 1958). Over the years, courts have extended the Eighth Amendment protections beyond sentencing to require that prisons offer certain minimum levels of nutrition, health care, space, and safety. Contemporary debates over the Eighth Amendment include the continued use of the death penalty and the imposition on convicted sex offenders of various civil restraints like registration requirements, bans on living within a certain distance of schools and parks, restrictions on Internet use, and so on. The Supreme Court has upheld the sex offender regulations as valid civil administrative measures. The Court did effectively impose a moratorium on state death penalty laws in 1972, after finding in a set of consolidated cases that the laws operated in an arbitrary and racially discriminatory manner. By 1976, several states had rewritten their laws to address the administrative issues the Court had cited earlier, and the Court reinstated the punishment as constitutional.

So far the majority of Justices on the Court have rejected modern calls to declare the death penalty unconstitutional categorically, noting that the Constitution expressly contemplates the imposition of death as a punishment and citing the value of having issues of appropriate punishment for crime judged by the electorate. The Court has, however, found that the death penalty is a cruel and unusual punishment for minors and those with mental retardation and for crimes where the victim did not die, and two Justices would invalidate the death penalty altogether, citing continued racial bias and arbitrariness in its imposition and a failure of the punishment to achieve its stated goals of deterrence and retribution. Meanwhile, opponents of the death penalty have had striking success getting companies to withhold from state execution programs the drugs that have been used for lethal injection; this has forced states to seek alternative drugs or reintroduce older forms of execution like firing squads. While constitutional challenges to these other methods continue, some state legislatures and governors have ended their death penalty programs, citing the high cost of executions compared to the imposition of life terms, among other reasons.

### Enforcing Constitutional Rights Against Public Administrators

A combination of statutes and judicial decisions waives government immunity and permits individuals to bring lawsuits against federal, state, and local officials (and in limited cases, local government entities) claiming the violation of their constitutional rights and seeking money damages, court orders, and attorney fees. (Blum and Urbonya, [will supply page numbers shortly]; Rosenbloom, 58–59) Officials may be sued in their official or individual (personal) capacity; the former applies when the official acts while clothed in her government authority, even if she abuses her position, and is effectively a suit against the government entity. The latter applies when she is acting outside the scope of her official duties and is a claim against her personal assets. A government official sued in her individual capacity may only be held personally liable if she violated "clearly established . . . constitutional rights of which a reasonable person would have known" (Harlow v. Fitzgerald, 457 U.S. 800, 818 (1982)). This "qualified immunity" protects her not just from

liability but from the suit itself; that is, courts judge at the outset if immunity exists and, if so, dismiss the claims before further costs are incurred. Qualified immunity helps ensure that public officials have fair notice that their behavior is unconstitutional before penalizing them and also helps give them the "breathing room" to make difficult decisions on the job without undue risk of liability. Because so many constitutional cases are decided through ad hoc balancing tests and fact-intensive analyses, the law rarely will be "clearly established," which greatly limits in practice the personal liability of public officials.

## Conclusion

To carry out their duties responsibly, avoid wasteful and distracting litigation, and honor some of the central values shaping American government, public administrators must consider how their choices affect individual rights and liberties and integrate that analysis into their daily decisionmaking. The application of constitutional standards designed to protect those rights and liberties, to new human activities and the regulation of them, can be challenging for both public administrators and courts. Public administrators should ensure that they have mechanisms in place to remain well informed about constitutional developments affecting their work. And, while constitutional values in principle trump values of administrative efficiency, the magnitude of a problem government seeks to address and the efficacy of a measure in addressing it, can substantially shape how a court balances individual liberties and administrative needs. It is therefore in the interest of public administrators to supply courts, legislators and the public with the necessary data and experience-based perspectives to defend reasonable regulatory efforts against constitutional challenge.

Codified constitutions; Codified laws; National constitutions; Uncodified constitutions

## Definition

Constitutional law defines the power of and the relationship between the different entities of the government as well as the power of and the relationship between the government and the people.

## Introduction

Most countries today have a constitution that sets up their government structure and defines the relationships between entities of the government, specifically how the divisions of government interact and function together. Even China's rule by one party is codified by a constitution. The constitutions of democratic countries

generally set up a parliamentary system or a system of separation of powers. Democratic constitutions also typically codify the rights of the people, both through substantive and procedural due process protections. The type of government set up by the constitution will affect how public administration operates and interacts with other areas of the government.

The creation and role of public administration are not necessarily addressed in constitutions, but all governments produce public administration as a necessary function of their day-to-day operations. Public administration is generally considered to be part of the executive branch, although it often functions independently and more often includes multiple functions. Conflicts arise when a public agency is perceived to have overstepped its boundaries, especially since the confines of jurisdiction are often unclear. When there is a conflict between entities of government over the divisions of power or between the people and government over rights, in most countries constitutional law is used to determine the outcome. Constitutional law encompasses the fundamental principles that grant the government the power to act but also includes the limits to government action.

## Constitutional Law and Public Administration

The relationship between constitutional law and public administration will depend greatly on the type of government that has been created by the constitution, as well as how the different parts of the government are expected to interact with each other. Not all constitutions are written, there are a handful of countries that have unwritten or uncodified constitutions. Constitutions also do not necessarily set up democratic governments. Many monarchy, authoritarian, and one-party governments are formed by their country's constitution, although constitutional law in many of these countries will have a limited role in keeping the government restrained. Most democratic constitutions set up either a parliamentary system, a system of separation of powers, or a hybrid of the two. Even in democratic countries, the role of constitutional law will vary greatly by country depending on how the government is structured.

Many countries, including most European countries, have chosen a parliamentary or hybrid system of government, instead of a pure separation of powers regime. In parliamentary government systems, the executive functions are part of the legislative branch. There is some separation of the two functions but not to the same extent that is seen in countries with a clear separation of powers. The executive administration's actions are generally subject to approval by the legislature, since the executive is part of as well as elected by the legislative branch. In parliamentary systems, the legislature usually has more control over the actions of public administration even when the structure of government puts it within the executive branch.

In parliamentary systems the courts usually play a smaller role than they do in systems with separation of powers (Bignami 1999). This means that the role of constitutional law will likely be decreased in parliamentary systems. In fact, in Great Britain the Parliament is supreme, which means the courts are not allowed to rule any legislation passed by the British Parliament as unconstitutional. Great Britain is also unique in the fact that it is one of the few nations with an unwritten or uncodified constitution. Their constitution is a collection of the laws passed by Parliament, court decisions, and common law. Therefore, the British Constitution can be changed at any time by Parliament. There are a broad range of approaches by other European nations, including Germany who has a supreme court similar to what is found in a separation of powers regime, such as the United States. Generally, in parliamentary governments the legislative branch has more power than the executive or judicial branches, which means that constitutional law is going to have a more limited role than in separation of powers regimes.

Some countries, particularly in South America, have followed the United States' lead and adopted the belief that power should be divided into separate branches. These government systems use checks and balances to ensure that one branch does not become more powerful than another.

Each branch of government has a means of checking the power of the other branches, thus ensuring the correct balance of power is maintained. The belief is that power should be equally divided between the three branches. In these types of governments, constitutional law has a significant role to play in determining when one branch has overstepped its power over another or when one or more branches of government has violated the due process rights of its citizens.

Every country is unique in how it approaches constitutional law; therefore, it is helpful to look at one example. The United States has a long and robust history of constitutional law, despite the fact that it has one of the shortest constitutions ever written. The drafters of the US Constitutions were so concerned about the legislative branch becoming too powerful that most of the first two pages of the four-page Constitution were spent discussing Congress' powers and limits. There was a concern that the nature of legislative powers makes the legislature the most powerful by default; therefore, it is the only branch that has a section in the Constitution specifically devoted to instructing Congress on what it cannot do. In Federalist No. 48, Madison explains that without a check on its power, the legislative branch is likely to take over the functions and powers of the executive and judiciary; therefore, a lot of time was spent designing a legislature that would function effectively with the separation of powers' restrictions. This included dividing the power of the legislature into two separate houses. The framers spent nearly one page discussing the executive branch, although much of that was used to explain the complicated process of electing the president. Less than one third of a page was devoted to discussing the judicial branch. Despite the discrepancy in how much space was devoted to explaining each branch of government in the Constitution, there was an overriding belief that the three branches of government were coequals and each one would place a check on the power of the other two.

Although Madison discusses in Federalist No. 78 the virtue of having the judiciary and not Congress, itself, determines when the Constitution has been violated, it does not take hold in the American government for over a decade (2014d). The US Constitution does not explicitly give the judiciary the power to review laws; in fact, it does not articulate much about the courts except that there will be a Supreme Court and lowers courts. Congress is given the power to decide what the jurisdiction of the courts will be, how many justices will serve on the Supreme Court, and how many lowers will be created. Constitutional law in the United States officially begins in the Supreme Court decision of *Marbury v. Madison* (1803). This is also the case that helped put the judicial branch in more equal standing with the legislative and executive branches. In this case, Chief Justice John Marshall declared that the Court had the power of judicial review. Judicial review gives the Supreme Court the power to tell the other branches of government when they are overstepping their constitutionally given power. As a result of this case, in the United States the Supreme Court has become the ultimate decider of what is constitutional and what violates the Constitution. The US Supreme Court has been determining the balance of power between the branches of government ever since.

The US Constitution makes no mention of public administration, but public administration is still bound by constitutional law. Public administrators take an oath of office that includes agreeing to uphold the Constitution. Public administration is created by laws authorizing the government to take action, known as enacting legislation. The enacting legislation creates or expands an agency to carry out the new responsibilities. The legitimacy of public administration in the United States is dependent upon the US Constitution and the rule of law. The professional loyalty of public administrators should be to the US Constitution. This adherence to the rule of law and loyalty to the Constitution are what separates public administration from business administration (Newbold 2011). Regardless of the fact that public administration is not mentioned in the US Constitution, public administrators are required to uphold constitutional law, but their functions often conflict with the separation of powers created by the Constitution which is further

complicated by the fact that the Constitution gives no guidance for the role and function of public administration.

## Public Administration and Separation of Powers

Countries, like the United States, that have a strong belief in separation of powers will spend a lot of time and energy ensuring the separation of powers is not eroded. In fact, Garry Wills wrote an entire book on Americans' distrust of government and why it is *A Necessary Evil*. He claimed American "liberty depends so heavily on distrust of government that the government itself, we are constantly told, was constructed to instill that distrust" (2002, p. 16). American distrust of government is very much tied into the belief in a system that ensures separation of powers. There is an overriding fear of what would happen if power becomes too concentrated in one branch. The belief in separation of powers is based on the philosophy of Aristotle from around 350 B.C. that held there were three types of government functions: the deliberative, the magisterial, and the judicative. The Baron de Montesquieu extended this philosophy arguing that these powers should be divided into three separate branches of government: legislative (lawmaking), executive (law enforcing), and judicial (law interpretation). He posited "when the legislative and executive powers are united in the same person, or in the same body of magistrates, there can be no liberty. . .Again, there is no liberty, if the judiciary power be not separated from the legislative and executive" (1748). Montesquieu made a strong argument for keeping the three types of government power separate.

This idea was first put into practice in the United States. James Madison, in 1788, wrote in Federalist No. 47 in defense of the newly written US Constitution, "The accumulation of all powers, legislative, executive and judicial in the same hands . . . may justly be pronounced the very definition of tyranny" (2014a, p. 235). Although, Madison further explains in Federalists No. 47 and 48 that he is not advocating for a pure separation of powers. Nor did Madison believe that a pure separation of powers is what Montesquieu intended, because the structure of checks and balances in the government necessarily creates overlapping powers (2014a, b). In fact, in Federalist No. 48, he expounds on why it is essential that each branch has constitutional control over the other, in order to ensure that the power of each is secure (2014b). When there is overlapping power, however, the question will be asked: where does the power of one branch end and the power of another branch begin? In the United States, the Supreme Court hears cases when there is conflict to determine which branch is given the power under constitutional law. This includes whether or not the Supreme Court itself has the power to hear and decide the case. The separation of powers is further complicated when discussing the role of public administration, which often encompasses all three functions in the same agency.

The nature of public administration requires it to possess legislative, executive, and judicial powers. Congress is the main power source for public administration, because they create or expand agencies, govern the budget, define the scope of a project, and determine how much authority is given to the agency. Nevertheless, most agencies are part of the executive branch of government, because the agencies' main function is to carry out or enforce the law. At the same time, the scope of authority given to agencies often includes the power to create specific regulations or policies, which are legislative powers. Additionally, most agencies require that individuals appeal to them first for any grievances, meaning they also have judicial powers. In countries like the United States with a system of government designed to divide power into separate branches, this intertwining of the three types of government power can appear to put public administration at odds with the spirit of the Constitution.

The modern bureaucracy in the United States is often referred to as the fourth branch of government, although there is no mention or creation of it by the Constitution. Public administration in the United States has grown significantly over the past 100 years. In fact, the amount of legislative

output by the agencies exceeds that by Congress. The new legislation added to the *Code of Federal Regulations* by far exceeds that added to the US Code each year. The *Code of Federal Regulations* is broken up into 50 titles based on the type of regulation. It is made up of nearly 200 volumes, and each volume is updated once a year (National Archives n.d.). The US Code has 54 titles and the most recent printed version in 2012 had 27 volumes. Although, it takes 235 volumes to contain over 200 years of legislation including annotation on previous versions of legislation. The US Code is only updated every 6 years with supplements being printed during the other years (Office of the Law Revision Counsel n.d.). Both sets of volumes cover a wide range of topics and a large amount of regulation, but only the regulations by public administration are created or updated so regularly that the *Code of Federal Regulations* has to be updated yearly. In fact, it is necessary to use the *Federal Registry* between updates to ensure that the most up-to-date regulation is being used. Public administration in the United States is not only enacting legislation but is also producing legislation at a very high volume. This raises some concerns about the balance of power, when it is considered with James Madison's comments on the legislative power having the ability to override the other functions if it is not kept in check. Congress' legislative powers are specifically limited by the Constitution, but there is no such limit on public administration.

The amount of legislation produced by agencies through the creation of regulations has many concerned that the balance of power in the US government is no longer in check. Congress gives agencies different levels of rule-making power: legislative and interpretive. Legislative rule-making power gives regulations created by agencies the same force and effect as laws passed by Congress. Interpretive regulations are given a somewhat lower status and are therefore more open to interpretation or invalidation by the judiciary (Warren 2004). However, the agencies are still afforded a lot of deference even with interpretative rules. In *Chevron, U.S.A., Inc. v. Natural Resources Defense Council, Inc*. (1984), the US Supreme Court held that a challenge to administrative regulation will fail when it "centers on the wisdom of the agency's policy, rather than whether it is a reasonable choice within a gap left open by Congress" (at 866). The *Chevron* deference requires courts defer to the interpretation of an agency when Congress has given them the authority, and Congress is silent or ambiguous on the subject as long as the interpretation is reasonable. There are some that argue this doctrine counters *Marbury* by allowing public administration to be the emphatic decider of what the law is rather than the courts (Slattery 2015; Sunstein 2006). Many disagree on where the line should be drawn between deference to agency knowledge and ensuring the balance of separation of powers.

In *City of Arlington v. Federal Communications Commission* (2013), the Court further held that the *Chevron* deference includes interpretation of the scope of authority by the agency. Chief Justice Roberts dissented arguing that courts "do not defer to an agency's interpretation of an ambiguous provision unless Congress wants us to, and whether Congress wants us to is a question that courts, not agencies, must decide" (*Id*. at 1883). He further explained that while the *Chevron* deference intended to prevent courts from becoming policymakers in place of the executive, the courts still have a responsibility to determine where to draw the line between the legislative and executive branches (*Id*.). The *Chevron* decision requires courts to determine first if Congress was silent on an interpretation then to determine if the agency's interpretation is reasonable. The problem is that the terms "reasonable" and "permissible" are abstract, malleable terms that easily allow deference to agency interpretation, even if there is a better construction (Slattery 2015). If the courts are always deferring to the agencies then they might not be providing a robust check to agency actions as required by the separation of powers.

Those that challenge the *Chevron* ruling further argue that it allows public administration too much power, especially considering that it is difficult to provide effective oversight of agency actions. The Supreme Court had earlier explained in *Bowsher v. Synar* that "interpreting a law enacted by Congress to implement the legislative

mandate is the very essence of 'execution' of the law" (1986 at 733). This case held that the Gramm-Rudman-Hollings Act was unconstitutional, because Congress could not control how an agency enacted legislation which was an executive power. In this case, Congress was not allowed to remove the Comptroller General since the position exercised executive power, and therefore Congress did not have the removal authority. In theory, the President does have the ability to oversee agency actions, but the capability to actively supervise the vast array of agencies in an effective manner is difficult. Additionally, Congress has made some agencies independent by limiting the president's ability to remove the agency leaders without cause, thereby insulating them from presidential power. Given the limited ability of the executive and legislative branches to restrict agency actions, there are some that believe the courts should use independent judgment in reviewing public administrative rule making rather than deferring automatically to an agency's "reasonable" interpretation (Slattery 2015). Their concern is that this "fourth branch," which is not even mentioned in the US Constitution, has become more powerful than the other branches when such deference is afforded in violation of the separation of power.

There are some that believe the Supreme Court's decision to give deference to public administrators is founded in the separation of powers doctrine. "It is in honor of the constitutional separation of powers doctrine and out of respect for the expertise of administrators" (Warren 2004). The argument is that it prevents one branch from implementing their preference on another branch. However, there is still a concern if the deference leads to a lack of oversight of agency actions. This is particularly true if the concern is in regard to the due process rights of citizens.

## The Problem of Ensuring Due Process

In addition to setting up the government structure, democratic constitutions also typically specify the rights of the citizens. This includes both rights that the government is not supposed to violate and rights given by the government. Civil liberties are rights that the government is not allowed to violate, such as freedom of speech and religion. Civil rights are rights that are given by the government, and therefore, the government must take actions in order to protect those rights from other individuals or states. A good example would be the right to vote. Constitutional law protects citizens from oversteps by the government that infringe on both their civil liberties and civil rights.

The original US Constitution did not include written rights, because the framers believed that the separation of powers and checks on power built into the structure of the government would be enough to protect citizens' due process and other rights. They were not able to convince enough of the detractors to the new Constitution that the separation of powers would be enough, so they negotiated amending the Constitution to include a written Bill of Rights in order to ensure ratification. However, there is still a strong belief that the separation of powers in government is important for ensuring protection of individual rights, particularly due process rights. There is a concern that the blurring of the separation of powers by public administration raises the question of whether the system of checks and balances still exists to protect individual due process rights from agency actions.

The US Constitution protects both procedural and substantive due process. Procedural due process ensures that fair procedures are put in place and followed before the government is allowed to deprive an individual of life, liberty, or property. Substantive due process protects rights that are viewed to be fundamental liberties ensured by the Constitution from government interference. Most of the concerns over public administration's perceived violations of due process have to do with procedural issues. The concern is that when the same government entity is creating the regulations, enforcing the regulations, and adjudicating challenges to the regulations, it is difficult to ensure procedural due process or create fair procedures.

In the United States, agencies must adhere to due process as defined by the US Constitution.

Newbold contends that "it is not possible in the American administrative state to separate the rule of law with the preservation of liberty; one is intrinsically connected with the other" (2011, p. 469). He further states that if public administration's primary goal is upholding the Constitution, then discretionary power should be used to keep the separation of powers balanced, ensuring the protection of individual rights. This means public administrators should find themselves attending to all three constitutional branches of government in pursuit of this goal (Newbold 2011).

In the United States, there is always a concern that public administration is violating basic constitutional rights, particularly due process rights. When one administration is creating, implementing, and adjudicating policies and regulations, there is a concern that individual due process rights will be violated. If the same agency that created and implemented the laws is determining whether or not they violated an individual's rights, then many individuals argue that specific steps need to be put in place to safeguard due process or the individual is not going to get a fair hearing. Safeguards have to be put in place to ensure fairness, and in countries like the United States, the individual always has the right to appeal a decision to the judiciary, but there remains a shadow of concern especially if deference is given to agency actions.

Procedural due process is the belief that a process of adjudication should be fair. In the United States, due process in criminal and civil law has developed over time to the point that most people have a fairly good idea of what is considered a fair trial. Many raise the question whether agency hearings can be fair. What is considered due process in administrative law depends on what interests are at stake. In order to help meet the requirements of due process, the Administrative Procedure Act (APA) has given several requirements for all agency hearings. The major provisions require that proper notice be given, that convenience is considered in scheduling, that all parties must be given the opportunity to submit relevant information, and that agency employees who were involved in the investigation cannot participate in the hearing decision (Warren 2004). These steps are meant to create a more formal process, but agency hearings are still less formal than court proceedings.

In *Mathews v. Eldridge* (1976), the Supreme Court created a test to determine what types of due process procedures should be given. It is a three-prong test, which requires agencies to review (1) the private interest at stake, (2) the chance of making a mistake with a decision to remove the interest, and (3) the potential administrative burden to the government of additional procedural requirements. It is important that public administrators understand what procedural protections are afforded, because the Supreme Court held in *Harlow v. Fitzgerald* (1982) that public administrators who violate individual citizens' constitutional rights can be held personally liable. A clear understanding of the Constitution's boundaries ensures that administrators do not use their discretion to violate individual rights (Newbold 2011).

Besides ensuring that the correct procedures are in place in agency hearings, there is also a concern about the independence of administrative judges. Those in favor of maintaining the current system argue that it balances fairness with the need for effective processes. The concern is that leaders of agencies are political appointees, which means that their political philosophy is likely to guide their decision making (Warren 2004). There is a question of how independent an administrative judge has to be in order to ensure due process? "Predispositions should not bias hearing decisions to such an extent that a mockery is made of due process" (Warren 2004, p. 289). It is important to note that an administrative judge's verdict is not necessarily the final say from the agency, because the head of the agency can override any decision made at the conclusion of the hearing by making an institutional decision. Administrative judges' decisions can be viewed more as advisory opinions. The Supreme Court has urged agency heads to provide a reasonable justification for reversing a decision, but the decisions are often based on political reasons that do not have legal justification (Warren 2004). This once again raises the question of how much deference the courts should give to agency decisions.

Constitutional law oversees administrative law, but they function differently. Those different functions help explain the role that each plays in ensuring due process in public administration. Administrative law is made up of the policies, regulations, and decisions of public administrations. Constitutional law is the law created by a constitution and decisions made to ensure that the laws are upheld. What can happen if constitutional law must provide deference to administrative law?

## Conclusion

Constitutional law is important for ensuring that agencies do not violate the rights of citizens. This is particularly true for governments that have adopted a system of separation of powers. The nature of public administration means that their powers will overlap with all three branches of government. This creates a fear that the balance of power between the branches is put in jeopardy. There is also a need to put safeguards in place to ensure that the due process of citizens is not violated.

Public administrators are asked to balance the competing values of efficiency and effectiveness with responsibility and responsiveness. In a system of separation of powers, this can be very difficult as civil servants may be asked to pursue a different course by each of the branches of government (Newbold 2011). James Madison and the framers of the US Constitutions were in favor of this conflict as a means of ensuring liberty and the protection of individual rights. It is important that public administrators remember they had a reason for creating a system of checks and balances in a government designed to ensure separation of powers. There was a method to this sometimes perceived madness. If public administrators remember they have a responsibility to the Constitution, then they will be more likely to strike the right balance between the competing ideals. They will be more likely to balance the need for efficiency and effectiveness while still maintaining equity and equality of representation (Newbold 2011).

In Federalist No. 51, Madison writes about the importance of separation of powers in administration, to ensure a balance of power between the branches of government (2014c). It is within the administrative agencies that each branch of government attempts to extend its own power but also where it is able to check the power of the other branches (Newbold 2011).

# Constitutional Law and Public Administration, Russia

Ivan Leksin
School of Public Administration, Lomonosov Moscow State University, Moscow, Russian Federation

## Synonyms

Constitutional legislation; Legal provisions regarding constitutional matters

## Definition

Constitutional law is a system of legal provisions that regulate fundamental social relations. The latter refer to the following matters regarded to be of vital importance to the individuals and to society as a whole:

- Human rights, freedoms, and responsibilities
- Basics of the social structure and political regime
- Political structure of the state territory
- Formation, composition, and functions of the higher governmental institutions, as well as their relationships

## Introduction

Within the listed fields, the constitutional law affects public administration primarily in the following ways:

- Setting general restrictions for the public officials preventing encroachment on the human rights
- Setting the basic framework for the social status of the public servants and other officials involved in public administration and providing for social guarantees for them
- Providing for the federal structure of government and for the separation of federal, regional, and municipal systems of public service
- Setting the basic rules for the formation, composition, and functioning of the federal and regional executives and for their relations with the legislative and judicial bodies
- Setting the basic rules for the formation, composition, and functioning of the local administrative bodies and for their relations with the municipal representative bodies, as well as with the federal and regional executives

Provisions of the listed types can be found in various sources: in the Constitution of the Russian Federation; in federal constitutional laws and ordinary federal laws; in some presidential decrees; in the regional constitutions, statutes, and laws; in the rulings of the Constitutional Court of the Russian Federation as well as of the regional constitutional courts of republics and statute courts of some constituent units of the other types; and in the normative acts issued by the representative bodies of local governments and by the chief officials of municipalities (see, e.g., Avakyan 2014; Kutafin and Fadeev 2013).

## The Constitution of the Russian Federation and Public Administration

Federal Constitution contains dozens of provisions that set the institutional basis of public administration and the functions of executive bodies, constraining officials from arbitrariness. Namely, the Constitution of the Russian Federation:

- Proclaims human rights and freedoms as a supreme value and obligates the government to recognize, observe, and protect them
- Lists basic human rights and freedoms and provides for amenability of governmental bodies and of their officials for damage caused by their unlawful actions (or by their inaction)
- Proclaims popular sovereignty and provides for prosecution for the seizure of governmental power
- Provides for the citizens' right to participate in managing state affairs and proclaims equal access to public service
- Proclaims the separation of powers, autonomy of the regional governments (see chapters ▶ "Multilevel Governance and Public Administration, Russia," ▶ "Regional Executives, Russia"), and local self-government (see chapter ▶ "Institutional Foundations of Local Self-Government, Russia")
- Defines the role of the President of the Russian Federation in public administration (see chapter ▶ "Head of the State and Public Administration, Russia")
- Describes the procedures of the formation of the Government of the Russian Federation, its composition, functions, and responsibility (see chapter ▶ "Federal Government, Russia")
